# AMERICAN RAILROAD JOURNAL, AND GENERAL ADVERTISER

FOR RAILROADS, CANALS, STEAMBOATS, MACHINERY,  
AND MINES.

ESTABLISHED 1831.

PUBLISHED WEEKLY, AT No. 105 CHESTNUT STREET, PHILADELPHIA, AT FIVE DOLLARS PER ANNUM.  
SECOND QUARTO SERIES, VOL. III, No. 1.] SATURDAY, JANUARY 2, 1847. [WHOLE No. 550, Vol. XX.

## AMERICAN RAILROAD JOURNAL.

OFFICE AT THE FRANKLIN HOUSE,  
105 Chestnut Street,  
PHILADELPHIA, PA.

This is the only periodical having a general circulation throughout the Union, in which all matters connected with public works can be brought to the notice of all persons in any way interested in these undertakings. Hence it offers peculiar advantages for advertising times of departure, rates of fare and freight, improvements in machinery, materials, as iron, timber, stone, cement, etc. It is also the best medium for advertising contracts, and placing the merits of new undertakings fairly before the public.

TERMS. — Five Dollars a year, in advance.

**BOSTON AND PROVIDENCE RAILROAD.** Passenger Notice. Summer Arrangement. On and after Monday, Sept. 28, 1846, the Passenger Trains will run as follows:

For New York—Night Line, via Stonington. Leaves Boston every day, but Sunday, at 5 p.m. Accommodation Trains, leave Boston at 7½ a.m. and 3½ p.m., and Providence at 8 a.m. and 3½ p.m. Dedham trains, leave Boston at 9 a.m.; 3 p.m., 5½ p.m., and 10½ p.m. Leave Dedham at 8 a.m. and 4½ and 9 p.m.

Stoughton trains, leave Boston at 11½ a.m. and 4-10 p.m. Leave Stoughton at 8 a.m. and 2½ p.m. All baggage at the risk of the owners thereof.

31 ly W. RAYMOND LEE, Sup't.

**BRANCH RAILROAD AND STAGES** Connecting with the Boston and Providence Railroad.

Stages connect with the Accommodation trains at the Foxboro' Station, to and from Woonsocket. At the Seekonk Station, to and from Lonsdale, R. I. via Pawtucket. At the Sharon Station, to and from Walpole, Mass. And at Dedham Village Station, to and from Medford, via Medway, Mass. At Providence, to and from Bristol, via Warren, R. I.—Taunton, New Bedford and Fall River cars run in connection with the accommodation trains.

## BOSTON AND MAINE RAILROAD.

Upper Route, Boston to Portland via, Reading, Andover, Haverhill, Exeter, Dover, Great Falls, South & North Berwick, Wells, Kennebunk and Saco.

Winter Arrangement, 1846-7.

On and after October 5th, 1846, Passenger Trains will leave daily, (Sundays excepted,) as follows: Boston for Portland at 7½ a.m. and 2½ p.m. Boston for Great Falls at 7½ a.m., 2½ and 3-25 p.m.

Boston for Haverhill at 7½ and 11½ a.m., 2½, 3-25 and 5 p.m.

Boston for Reading at 7½, and 11½ a.m., 2½, 3-25 and 6½ p.m.

Portland for Boston at 7½ a.m., and 3 p.m. Great Falls for Boston at 6½ and 9½ a.m., and 4½ p.m.

Haverhill for Boston at 7½, 8½, and 11 a.m. and 3 and 6½ p.m.

Reading for Boston at 7, 8½ and 9½ a.m., 12 m., 1½, 4 and 7½ p.m.

The Depot in Boston is on Haymarket Square. Passengers are not allowed to carry Baggage above \$50 in value, and that personal Baggage, unless notice is given, and an extra amount paid, at the rate of the price of a Ticket for every \$500 additional value.

1y31 CHAS. MINOT, Super't.

## THE BEST RAILROAD ROUTE TO THE Lake and Buffalo, from Cincinnati.

Take Cars to Xenia, 65 miles; take Stage to Mansfield, 88 miles; thence by Cars to Sandusky, 56 miles to the Lake; thence Steamboat to Buffalo, 230 miles.

Fare from Cincinnati to Sandusky.....\$8 00 " " Sandusky to Buffalo, Cabin..... 6 00 " " " " Steerage.... 4 50

Fare by this route, although the cheapest across the state, will be reduced in a short time, railroad lengthened, and speed increased.

Leave Cincinnati in the morning, arrive at Columbus at night.

Leave Columbus in the morning, arrive at Sandusky same day.

Leave Sandusky, by Boat, in the morning, arrive at Buffalo next morning in time for the Cars north and east for Niagara Falls, Canada, Saratoga Springs, Troy, Albany, Boston, New York, Washington, or Philadelphia.

Passengers should not omit to pay their fare through from Cincinnati to Sandusky, or from Columbus to Sandusky via Mansfield; as this route is the only one that secures 56 miles [this road is run over in 2h. 50m.,] most railroad which is new, and is the shortest, cheapest and most expeditious across the state.

Fares on the New York railroads are about to be reduced.

B. HIGGINS, Sup't, etc.  
Sandusky, Ohio. M. & S. C. R. R. Co.

## SUMMER ARRANGEMENT.—NEW YORK

AND ERIE RAILROAD LINE, from April 1st until further notice, will run daily (Sundays excepted) between the city of New York and Middletown, Goshen, and intermediate places, as follows:

FOR PASSENGERS—

Leave New York at 7 A. M. and 4 P. M.

" Middletown at 6½ A. M. and 5½ P. M.

FARE REDUCED to \$1 25 to Middletown—way in proportion. Breakfast, supper and berths can be had on the steamboat.

FOR FREIGHT—

Leave New York at 5 P. M.

" Middletown at 12 M.

The names of the consignee and of the station where to be left, must be distinctly marked upon each article shipped. Freight not received after 5 P. M. in New York.

Apply to J. F. Clarkson, agent, at office corner of Duane and West sts. H. C. SEYMOUR, Sup't, March 25th, 1846.

Stages run daily from Middletown, on the arrival of the afternoon train, to Milford, Carbondale, Honesdale, Montrose, Towanda, Owego, and West; also to Monticello, Windsor, Binghamton, Ithaca, etc., etc. Agent on board. 13 tf

## NORWICH AND WORCESTER RAILROAD.

Summer Arrangement, commencing Monday, April 6, 1846.

Accommodation Trains, daily, except Sunday. Leave Norwich, at 6 a.m., and 4½ p.m. Leave Worcester, at 10 a.m., and 4½ p.m.

The morning Accommodation Trains from Norwich, and from Worcester, connect with the trains of the Boston, and Worcester and Western railroads each way.

The Evening Accommodation Train from Worcester connects with the 1½ p.m. train from Boston.

New York Train via Long Island Railroad: Leave Allyn's Point for Boston, about 1 p.m., daily, except Sunday.

Leave Worcester for New York, about 10 a.m., stopping at Webster, Danielsonville, and Norwich.

New York Train via Steamboat—Leave Norwich for Boston, every morning, except Monday, on the arrival of the steamboat from New York, stopping at Norwich and Danielsonville.

Leave Worcester for New York, upon the arrival of the train from Boston, at about 4½ p.m., daily, except Sunday, stopping at Webster, Danielsonville and Norwich.

Freight Trains daily each way, except Sunday.—Special contracts will be made for cargoes, or large quantities of freight, on application to the superintendent.

Fares are Less when paid for Tickets than when paid in the Cars. J. W. STOWELL, Sup't.

**TROY RAILROADS.—IMPORTANT NOTICE.**—Troy and Greenbush Railroad, forming a continuous track from Boston to Buffalo and Saratoga Springs.

This road is new, and laid with the heaviest iron H rail. Trains will always be run on this road connecting at Greenbush each way with the trains to and from Boston and intermediate places, leaving Greenbush daily at 11 p.m. and 6 p.m., or on arrival of the trains from Boston; leave Troy at 7 1/2 a.m. and 4 1/2 p.m., or to connect with trains to Boston.

Trains also run hourly on this road between Troy and Albany. Running time between Greenbush and Troy, 15 minutes.

#### TROY AND SCHENECTADY RAILROAD.

This road is laid its entire length with the heaviest H rail—which is not the fact with the road from Albany. Trains will always be run on this road connecting each way, to and from Buffalo and intermediate places. Leave Troy for Buffalo at 7 1/2 a.m. and 1 p.m. and 6 1/2 p.m., or to connect with the trains for the west; leave Schenectady at 2 1/2 a.m., 8 1/2 a.m., 1 p.m. and 3 1/2 p.m., or on arrival of the trains from Buffalo and intermediate places.

#### TROY AND SARATOGA RAILROAD.

THE ONLY DIRECT ROUTE.

No change of passenger, baggage or other cars on this route. Cars leave Troy for Ballston, Saratoga Springs, Lake George and White Hall at 7 1/2 a.m., (arriving one hour in advance of the train from Albany,) and at 3 1/2 p.m. Returning, leave Saratoga at 9 a.m. and 3 1/2 p.m., (reaching Troy in time for the evening boats to New York.) Cars also leave Troy for the Burrough at 3 1/2 p.m. and 7 p.m., connecting with packet boats for the north. This takes passengers from New York and Boston to Montreal in 44 hours.

N.B. Travellers will find the routes through Troy most convenient and economical, and as expeditious as any other. The steamboats to and from New York land within a few steps of the railroad office, and passengers are taken up and landed by the different railroad lines at the doors of principal hotels, thus saving all necessity for, and annoyance from, hack drivers, cabmen, runners, etc.

Aug. 3, 1846.

1y 32

#### BALTIMORE AND OHIO RAILROAD.

**MAIN STEM.** The Train carrying the Great Western Mail leaves Baltimore every morning at 7 1/2 and Cumberland at 8 o'clock, passing Ellicott's Mills, Frederick, Harpers Ferry, Martinsburgh and Hancock, connecting daily each way with the Washington Trains at the Relay House seven miles from Baltimore, with the Winchester Trains at Harpers Ferry—with the various railroad and steamboat lines between Baltimore and Philadelphia and with the lines of Post Coaches between Cumberland and Wheeling and the fine Steamboats on the Monongahela Slack Water between Brownsville and Pittsburgh. Time of arrival at both Cumberland and Baltimore 5 1/2 P. M. Fare between those points \$7, and 4 cents per mile for less distances. Fare through to Wheeling \$11 and time about 36 hours, to Pittsburgh \$10, and time about 32 hours. Through tickets from Philadelphia to Wheeling \$13, to Pittsburgh \$13. Extra train daily except Sundays from Baltimore to Frederick at 4 P. M., and from Frederick to Baltimore at 8 A. M.

#### WASHINGTON BRANCH.

Daily trains at 9 A. M. and 5 P. M. and 12 at night from Baltimore and at 6 A. M. and 5 1/2 P. M. from Washington, connecting daily with the lines North, South and West, at Baltimore, Washington and the Relay house. Fare \$1 60 through between Baltimore and Washington, in either direction, 4 cents per mile for intermediate distances. 1y13y1

**THE SUBSCRIBER IS PREPARED TO** execute at the Trenton Iron Works, orders for Railroad Iron of any required pattern, and warranted equal in every respect in point of quality to the best American or imported Rails. Also on hand and made to order, Bar Iron, Braziers' and Wire Rods, etc., etc.

PETER COOPER 17 Burling Slip.

1y10

New York.

#### NEW RAILROAD ROUTE FROM BUFFALO TO CINCINNATI.

Passengers destined for Columbus and Cincinnati, O., Louisville, Ky., St. Louis, Mo., Memphis, Tenn., Vicksburg, Natches, New Orleans, and all intermediate ports, will find a new, and the most expeditious and comfortable Route, by taking Steamboats at Buffalo, landing at Sandusky City, Ohio, distance.....230 miles.

From thence by Cars, over the Mansfield Railroad which is new and just opened [laid with heavy iron,] to Mansfield, distance.....56 "

Thence by Stage via Columbus to Xenia over gravel and Macadamized Road, (the best in the state,) in new coaches, distance.....88 "

Thence, over the Little Miami Railroad, from Xenia to Cincinnati, distance....65 "

#### TIME.

From Buffalo to Sandusky.....24 hours.

Leave Sandusky 5 a.m. to Columbus....14 "

From Columbus to Cincinnati.....15 "

Or say 30 hours from Sandusky to Cincinnati over this route, including delays.

#### FARE.

From Buffalo to Sandusky, Cabin.....\$6 00

" " " " Steerage.....3 00

" Sandusky to Columbus.....4 50

" " through to Cincinnati.....8 00

Passengers should not omit to pay their fare through from Sandusky City to Cincinnati and take receipts availing themselves of the benefit of a contract existing between the said Railroad and Stage Co's, securing 121 miles travel by good Railroad and 88 miles by Stage, in crossing from Lake Erie to the Ohio river, in the space of 30 hours.

Passengers destined for St. Louis, or any point below on the Mississippi, will save by taking this route, from 4 to 6 days time and travel, and nearly half the expense, over the Chicago and Peoria route to the above places.

Fare by this route, although the cheapest, will in a short time be reduced, Railroad lengthened, and speed increased.

B. HIGGINS, Sup't, etc.  
M. & S. C. R. R. Co.

Sandusky City, Ohio.

#### NEW YORK & HARLEM RAILROAD CO.—Winter Arrangement.

On and after Monday, November 23, 1846, the cars will run as follows:

Fare from Baltimore to Charleston.....\$21 00  
" " " Richmond..... 6 60

For Tickets, or further information, apply at the Southern Ticket Office, adjoining the Washington Railroad Office, Pratt street, Baltimore, to 1y14  
STOCTON & FALLS, Agents.

**RAILROAD SCALES.—THE ATTENTION** of Railroad Companies is particularly requested to Ellicott's Scales, made for weighing loaded cars in trains, or singly, they have been the inventors, and the first to make platform scales in the United States; supposing that an experience of 20 years has given a knowledge and superior advantage in the business.

The levers of our scales are made of wrought iron, all the bearings and fulcrums are made of the best cast steel, laid on blocks of granite, extending across the pit, the upper part of the scale only being made of wood. E. Ellicott has made the largest Railroad Scale in the world, its extreme length was one hundred and twenty feet, capable of weighing ten loaded cars at a single draft. It was put on the Mine Hill and Schuylkill Haven Railroad.

We are prepared to make scales of any size to weigh from five pounds to two hundred tons.  
ELLICOTT & ABBOTT.  
Factory, 9th street, near Coates, cor. Melon st.  
Office, No. 3 North 5th street,  
1y25 Philadelphia, Pa.

J. EDGAR THOMSON,  
Ch. Eng. and Gen. Agent.  
Augusta, Sept. 2d, 1846. \*44 1y

**THE WESTERN AND ATLANTIC** Railroad.—This Road is now in operation to Oothcaloga, a distance of 80 miles, and connects daily (Sundays excepted) with the Georgia Railroad.

From Kingston, on this road, there is a tri-weekly line of stages, which leave on the arrival of the cars on Tuesday, Thursday and Saturday, for Warrenton, Huntsville, Decatur and Tusculumbia, Alabama, and Memphis, Tennessee.

On the same days, the stages leave Oothcaloga for Chattanooga, Jasper, Murfreesborough, Knoxville and Nashville, Tennessee.

This is the most expeditious route from the east to any of these places.

CHAS. F. M. GARNETT,  
Chief Engineer.  
Atlanta, Georgia, April 16th, 1846. 1y1

**TO RAILROAD COMPANIES AND MANUFACTURERS** of railroad machinery. The subscribers have for sale Am. and English bar iron, of all sizes; English blister, cast, shear and spring steel; Juniata rods; car axles, made of double refined iron; sheet and boiler iron, cut to pattern; tiers for locomotive engines, and other railroad carriage wheels, made from common and double refined B. O. iron; the latter a very superior article. The tires are made by Messrs. Baldwin & Whitney, locomotive engine manufacturers of this city. Orders addressed to them, or to us, will be promptly executed.

When the exact diameter of the wheel is stated in the order, a fit to those wheels is guaranteed, saving to the purchaser the expense of turning them out inside.

THOMAS & EDMUND GEORGE,  
a45 E. cor. 15th and Market sts., Philad., Pa.

**LITTLE MIAMI RAILROAD.—OPEN** TO SPRINGFIELD—Distance 84 miles—

connecting at Xenia and Springfield with Messrs. Neil, Moore, & Co's. daily daylight lines of stages going east and north, to Columbus, Zanesville, Wheeling, Cleveland, and Sandusky City, via Urbana, Bellefontaine, Kenton, and the Mad river and lake Erie railroad, or Columbus, Delaware, and the Mansfield and Sandusky City railroad—forming, by these connections, the cheapest and most expeditious route to Buffalo, Niagara Falls, Rochester, Albany, New York, and Boston.

On and after Thursday, August 13, 1846, until further notice, a Passenger train will run as follows: Leave Cincinnati daily at 9 A. M., for Milford, Foster's Crossing, Deerfield, Morrow, Fort Ancient, Freeport, Waynesville, Spring Valley, Xenia, Old Town, Yellow Springs, and Springfield.

Returning, will leave Springfield at 4 hours 35 minutes A. M. A line of Hacks runs in connection with the Cars, between Deerfield and Lebanon.

FARE—From Cincinnati to Lebanon....\$1 00  
" " " Xenia..... 1 50  
" " " Springfield.. 2 00  
" " " Columbus... 4 00  
" " " Sandusky city 8 00

The Passenger trains runs in connection with Strader & Gorman's line of Mail Packets to Louisville.

Tickets can be procured at the Broadway Hotel, Dennison House, or at the Depot of the Company, on East Front street.

Further information and through tickets for the Stage lines, may be procured at P. Campbell, Agent on Front street, near Broadway.

The company will not be responsible for baggage beyond 50 dollars in value, unless the same is returned to the conductor or agent, and freight paid at of a passage for every \$500 in value over that amount.

The 1½ P. M. train from Cincinnati, and the 2 40 P. M. train from Xenia, will be discontinued on and after Monday, the 10th instant.

A freight train will run daily.  
W. H. CLEMENT, Sup't.

**LAWRENCE'S ROSENDALE HYDRAULIC CEMENT.** This cement is warranted equal to any manufactured in this country, and has been pronounced superior to Francis' "Roman." Its value for Aqueducts, Locks, Bridges, Floors and all Masonry exposed to dampness, is well known, as it sets immediately under water, and increases in solidity for years.

For sale in lots to suit purchasers, in tight papered barrels, by JOHN W. LAWRENCE,  
142 Front street, New York.

Orders for the above will be received and promptly attended to at this office. 32 1y

**CLEVELAND, COLUMBUS AND CINCINNATI RAILROAD.** In pursuance of a resolution adopted by the Board of Directors, on the 21st October, notice is hereby given, that proposals will be received up to the 1st day of December next, for the Grading, Timbering, Bridges and Culverts on forty miles of the road, commencing at Cleveland. Profiles, Specifications, Terms of Payment, and all other information pertaining to the matter, to be furnished on application at the office of the Company, Merwin Block, Cleveland.

JOHN W. ALLEN, President.  
A. G. LAWRENCE, Secretary.  
CYRUS WILLIAMS, Engineer.  
Cleveland, October 23, 1846. 45\*1m

**BACK VOLUMES OF THE RAILROAD JOURNAL** for sale at the office, No. 105 Chestnut street.

**A. & G. RALSTON & CO., NO. 4** South Front St., Philadelphia, Pa.

Have now on hand, for sale, Railroad Iron, viz: 180 tons 2½ x 1 inch Flat Punched Rails, 90 ft. long.  
25 " 2½ x 1 " Flange Iron Rails.  
75 " 1 x 1 " Flat Punched Bars for Drafts in Mines. A full assortment of Railroad Spikes, Boat and Ship Spikes. They are prepared to execute orders for every description of Railroad Iron and Fixtures. 11f

**VALUABLE PROPERTY ON THE MILL Dam For Sale.** A lot of land on Gravelly Point, so called, on the Mill Dam, in Roxbury, fronting on and east of Parker street, containing 68,497 square feet, with the following buildings thereon standing.

Main brick building, 120 feet long, by 46 ft wide, two stories high. A machine shop, 47x43 feet, with large engine, face, screw, and other lathes, suitable to do any kind of work.

Pattern shop, 35x32 ft. with lathes, work benches,

Work shop, 86x35 feet, on the same floor with the pattern shop.

Forge shop, 118 feet long by 44 feet wide on the ground floor, with two large water wheels, each 16 feet long, 9 ft diameter, with all the gearing, shafts, drums, pulleys, &c., large and small trip hammers, furnaces, forges, rolling mill, with large balance wheel and a large blowing apparatus for the foundry.

Foundry, at end of main brick building, 60x45 ft, two stories high, with a shed part 45x20 feet, containing a large air furnace, cupola, crane and corn oven.

Store house—a range of buildings for storage, etc., 200 feet long by 20 wide.

Locomotive shop, adjoining main building, fronting on Parker street, 54x25 feet.

Also—A lot of land on the canal, west side of Parker st., containing 6000 feet, with the following buildings thereon standing:

Boiler house 50 feet long by 30 feet wide, two stories.

Blacksmith shop, 49 feet long by 20 feet wide.

For terms, apply to HENRY ANDREWS, 48 State st., or to CURTIS, LEAVENS & CO., 106 State st., Boston, or to A. & G. RALSTON & Co., Philadelphia. ja45

**TO RAILROAD COMPANIES AND BUILDERS OF MARINE AND LOCOMOTIVE ENGINES AND BOILERS.**

#### PASCAL IRON WORKS.

##### WELDED WROUGHT IRON TUBES

From 4 inches to 1 in calibre and 2 to 12 feet long, capable of sustaining pressure from 400 to 2500 lbs. per square inch, with Stop Cocks, T, L, and other fixtures to suit, fitting together, with screw joints, suitable for STEAM, WATER, GAS, and for LOCOMOTIVE and other STEAM BOILER FLUES.

Manufactured and for sale by  
**MORRIS, TASKER & MORRIS.**  
Warehouse S. E. Corner of Third & Walnut Streets,  
PHILADELPHIA.

##### PATENT INDESTRUCTIBLE WATER

Pipes. The subscribers continue to manufacture the above Pipes, of all the sizes and strength required for City or Country use, and would invite individuals or companies to examine its merits.—This pipe, unlike cast iron and lead, imparts neither color, oxide or taste, being formed of strongly riveted sheet iron, and evenly lined on the inside with hydraulic cement. While in the process of laying, it has a thick covering externally of the same—thus forming nature's own conduit of stone. The iron being thoroughly enclosed on both sides with cement, precludes the possibility of rust or decay, and renders the pipe truly indestructible. The prices are less than those of iron or lead. We also manufacture Basins and D. Traps, for Water Closets, on a new principle, which we wish the public to examine at 113 Fulton street, New York.

J. BALL & CO.

**TO LOCOMOTIVE AND MARINE ENGINE BOILER BUILDERS.** Pascal Iron Works, Philadelphia. Welded Wrought Iron Flues, suitable for Locomotives, Marine and other Steam Engine Boilers, from 2 to 5 inches in diameter. Also, Pipes for Gas, Steam and other purposes; extra strong Tube for Hydraulic Presses; Hollow Pistons for Pumps of Steam Engines, etc. Manufactured and for sale by

MORRIS TASKER & MORRIS,

Warehouse S. E. corner 3d and Walnut Sts., Philadelphia.

## NORRIS' LOCOMOTIVE WORKS.

BUSH HILL, PHILADELPHIA, Pennsylvania.

**MANUFACTURE** their Patent 6 Wheel Combined and 8 Wheel Locomotives of the following descriptions, viz:

Class	1,	15 inches Diameter of Cylinder, × 20 inches Stroke.
"	2,	14 " " " × 24 " "
"	3,	14 " " " × 20 " "
"	4,	12 " " " × 20 " "
"	5,	11 " " " × 20 " "
"	6,	10 " " " × 18 " "

With Wheels of any dimensions, with their Patent Arrangement for Variable Expansion. Castings of all kinds made to order; and they call attention to their Chilled Wheels, for the Trucks of Locomotives, Tenders and Cars.

**NORRIS, BROTHERS.**

#### THE NEWCASTLE MANUFACTURING

Company continue to furnish at the Works, situated in the town of Newcastle, Del., Locomotive and other steam engines, Jack screws, Wrought iron work and Brass and Iron castings, of all kinds connected with Steamboats, Railroads, etc.; Mill Gearing of every description; Cast wheels (chilled) of any pattern and size, with Axles fitted, also with wrought tires, Springs, Boxes and bolts for Cars; Driving and other wheels for Locomotives.

The works being on an extensive scale, all orders will be executed with promptness and despatch. Communications addressed to Mr. William H. Dobbs, Superintendent, will meet with immediate attention.

ANDREW C. GRAY,

245 President of the Newcastle Manuf. Co.

## "Railways at Home and Abroad."

THE EDINBURGH REVIEW, AND ITS ARTICLE ON RAILWAYS. (ART. VII.)

(Continued from page 823.)

The expense of working has, from increased attention to economy, and from exciting, by promotion and rewards, the good conduct and efficiency of engineers and other persons employed, gradually diminished from year to year. In 1844, it amounted to £66, per mile; being fifty-one per cent. of the gross receipts. A net profit of forty-nine per cent. of the receipts remained, which amounted to nearly four per cent. on the capital.

The Belgian railways have been constructed and worked by her government, not with a view to revenue, but solely with reference to the advancement of the general prosperity and well-being of the population. The tariff for passengers and goods has, therefore, been so regulated that the profits shall not exceed the interest of the capital sunk. The present fares for passengers are as follows:

		Tenths of a penny.	
For 1st class pass. ....	14 8-10	per pass.	per mile.
2d do. ....	8		
3d do. ....	6		

By the returns given above, we find that the average receipt per head per annum from passengers was 19½d.; and, since the average fare per head per mile is seven and a half tenths of a penny, it follows, that the average distance travelled by the passengers is twenty-five miles. By comparing this with the result of the traffic on the British lines, the effect of the lower fares is apparent. The second and third class on the latter travel, on an average, distances of twelve miles; on the Belgian lines, they move twice that distance. On the Belgian lines merchandize supplies forty per cent. of the gross revenue; on the British lines it supplies thirty-seven per cent. The chief part of the revenue derived from passengers on the Belgian, as well as on the British lines, arises from short traffic. This, in effect, will be found to prevail generally, wherever railways are brought into operation. It follows from what we have proved above, that the great majority of travellers on the Belgian lines are those whose excursions are under twenty-five miles. The gross annual revenue per mile, on the Belgian railways, is only £1290, being less than half the amount received on the British lines. Yet the net profit on the capital is but little less.

By a system of most judicious and liberal management, these railways have been rendered eminently serviceable to the country in the transport of every description of merchandize.

Admirable arrangements are made for the safe, expeditious, and cheap delivery of every package and parcel at the address of the consignee, who is subject to no additional or arbitrary expenses whatever, beyond the amount of the tariff, which varies, of course, according to the nature of the goods; but in all cases is on the lowest scale. The effect of these measures has been conspicuously apparent in the rapid augmentation of this department of transport. In 1841, before they were matured, the total receipts for merchandize were

£19,000. In 1844 its amount was £177,800! Before the establishment of the eastern branch of the railway, the highest amount of heavy goods sent to the German frontiers, by the old conveyances, was twelve thousand tons; in 1844 the amount transported was sixty-seven thousand five hundred tons! In 1842, before the railway took the traffic, the amount of light goods was one hundred and ninety-four thousand tons: in 1844 it exceeded five hundred thousand tons.

Although this general cheapness of transit necessarily entails on the passenger trains a diminished speed, compared with that which British railway travellers are accustomed to enjoy, considerable expedition is nevertheless effected. The mean speed of the passenger trains, while in full motion, is estimated at twenty miles an hour, and the rate, including stoppages, at seventeen and a half miles an hour.

The progress of this new instrument of social and national advancement in France, has not hitherto been commensurate with the position and pretensions of that great country. How far this backwardness is ascribable to the genius of her institutions; or to the distractions to which her government has been exposed, and the engrossing nature of the political questions which have occupied her chambers since the revolution of July; or, in fine, to a salutary foresight and enlightened caution, which prompted the policy of waiting to profit by the errors, and reap the harvest of the dearly paid for experience of Great Britain, we shall not stop to inquire. Whatever may have been the cause, she has unquestionably before her advantages of no ordinary magnitude and importance, arising from it.

Previous to 1830, a few railways had been constructed and worked in some of the mining districts of France similar to those which had long been used in the northern counties of England. It was not, however, till about the year 1836, that the true character which steam transport on railways was destined to assume, began to reveal itself to her government. The wonders of the Liverpool and Manchester line had been noised abroad. Its expedition and cheapness were the theme of general conversation. It was, however, regarded as in some measure an exceptional case, and few believed in its capability of general application. It was not until the railway from Paris to St. Germain (twelve miles) brought these effects under the very eyes of the Parisians, that a true sense of the importance of this improvement in locomotion was excited. This was soon followed by the opening of several other short lines—such as those from Paris to Versailles, from Montpelier to Cette, and from Alais to La Grande Comte.

At length, the government being fully alive to the importance of this new way of internal communication, it was resolved, in 1842, that a system of railways should be planned and executed. With this view, it was determined that from Paris, as a centre, main branch lines should issue, to be directed to those points of the frontiers, by land and

sea, that should best serve the purposes of foreign commerce; and that the demands of the interior should follow in passing through it, and in the various ramifications which they should throw off. In accordance with this plan, six great lines would issue from the capital. The first, proceeding northwards to the Belgian frontier, would unite with the railways of that state, near Lille and Valenciennes. Branches from Amiens and Lille would communicate with the channel at Bologne, Calais, and Dunkirk: thus opening a rapid and easy communication with England, and affording a means of transit with the fifth commercial port, and the great granary of the northern section of the kingdom.

The object of the second great artery was to open a communication with Spain.—"When," said the minister of public works in 1838, "Spain, restored to tranquillity, shall be able to renew with France those commercial relations which must contribute so largely to the wealth of our southern departments, what great results may we not expect from a railway from Paris to Bayonne, carrying the fruits of our industry at a low price into the frontier provinces of Spain! What beneficial influences, also, may not this new way of communication exert upon the political relations of the two countries—relations which every day proves the necessity of rendering more numerous and more close!" This line was to proceed from Paris southward, through Orleans, Tours, Poitiers, Angoulême, and Bordeaux, to Bayonne, throwing off branches to Nantes and Vierzon.

The eastern line would pass through Champagne and Lorraine, connecting Paris with Strasbourg, and Bale, with a branch to Metz; thus forming a direct communication with the Rhenish frontier, and uniting with the system of German railways. It was expected by this to share that traffic which now flows through the Belgian lines from Antwerp and Ostend to the Rhine.

A line to be carried from Paris to Brest, through Rennes, would afford to the products of the western provinces a passage to the Atlantic; in addition to that afforded by the branch of the great southern line directed on Nantes.

Between the southern and eastern lines just mentioned, is included a tract of country more than one hundred leagues in width, occupied by a dense and industrious population, and covered with a fertile soil. To enrich this tract, easy ways of communication alone are wanting. It was, therefore, decided to carry through it another great central line, which should extend to the base of the Pyrenees, thus opening a way to Saragossa and the central parts of Spain.

Finally, the western line would be directed upon Rouen, with branches to Havre and Dieppe; thus completing the system of communication with the ports of the channel and the Atlantic.

Such were the lines designed to issue from Paris as a centre. It was determined to complete the great communication of the country by two main lines proceeding from Marseilles, one leading to the Atlantic at Bordeaux, and

the other communicating by Lyons with Switzerland, Alsace, and Northern Germany; and running into the eastern line from Paris at Dijon.

By the line from Marseilles to Bordeaux, it is intended to join the Mediterranean with the Atlantic, to put in close connection the two chief ports of France, and to aid in restoring to Bordeaux its former importance. This line will throw out two branches on Tarbes and Perpignan, by which the communications with Spain will be completed.

By the line proceeding from Marseilles to the east, it is intended to supply a means of internal transport for the commerce of the Levant; which has been hitherto supplied to Europe chiefly through the port of Marseilles. The line of railway from Vienne to Trieste, carried, as it will be, through the heart of the German states, and having unbroken communication with the Baltic and the Northern seas, threatens to divert the Levant trade from Marseilles to Trieste. The line to which we now advert is designed to avert this loss.

Such is the system of railway communication which has been projected in France. Let us now see what progress has been made in its realization.

It appears by a statement published by M. Teisserenc, a member of the Superior Railway Commission, and which may be considered as having an official character, that at the end of 1844, the total length of the railways open to the public, in progress of construction, and projected and recognized by the legislature, but not commenced, was as follows:

Open for commerce .....	537
In progress of construction .....	1837
Planned .....	961

Total length of the contemplated system.....3335

The total amount of capital absorbed by the 537 miles then open, was £1,464,000. The average capital per mile was, therefore, £2,134.8. Assuming that the remainder of the system will be constructed at the same rate, which will probably be the case, the total amount of capital invested will be £71,195,580. Since the end of 1844, nearly 300 miles more have been opened for traffic; and it is expected that at the end of the present year, 1846, the total length of French railways open for commerce will be nearly 1000 miles.

To find the general financial averages resulting from the operation of the French railways, we have taken four hundred miles of those which have been used a sufficient time to afford the annual returns; and the results are as follows:

Total cost of construction and material per mile .....	£21,400
Gross annual receipts per mile .....	2,114
Annual expenses per mile .....	1,106
Annual net profit per mile .....	1,008

Taking these amounts in proportion to the capital sunk, and to each other, we find:

Annual receipts .....	10	per cent. of capital sunk.
Annual expenses .....	52	per cent. of receipts.
Annual profits .....	48	per cent. of receipts.
Profits .....	4 7-10	per cent. of capital.

It appears, therefore, that the average net

profit on the capital invested is about 4½ per cent., and that a little more than half the gross receipts go to defray the current expenses of the lines.

In comparing these conclusions with the current returns of particular lines, it is necessary not only to remember that they are average results, but that the final condition of each line fluctuates from year to year.—Generally, the best lines give improving returns.

When the entire system as designed by the state has been completed, the following results must ensue, in order that the capital to be invested may produce a net 5 per cent. annual profit:

Capital invested in 3335 miles at £21,195,580	£71,195,580
348 per mile .....	7,416,203
Gross and annual receipts .....	3,846,427
Gross and annual expense .....	2,550,784
Net annual profits .....	

The population of France being thirty-four millions, this will require an annual expenditure of £218,000 on railway transport, for every million of inhabitants.

The legislature has fixed the major limit of the fares chargeable to passengers as follows:

	Tenths of a penny.
1st Class, per passenger, per mile .....	16
2d " .....	13
3d " .....	8.8

The companies are obliged by law to supply covered carriages, with curtains at the windows, for third class passengers. These carriages are decidedly superior in convenience and comfort to the second class carriages on the British railways. Taking the returns of the traffic of the principal lines now in operation, we find that the average sum received from each passenger is 20d.—Now if we take the average fare per head per mile, at twelve-tenths of a penny, we shall find that the average distance which each passenger travels in twenty-five miles. Short passenger traffic is, therefore, the main source of the railway revenue here, as elsewhere.

The proximity of Belgium and France has necessarily rendered the British public more or less familiar with the extent of the system of railways already in operation in these states. Few, however, have any distinct notion of the advancement of railway transports in the other states of Europe, and still fewer of the vast system which is designed to be executed by the Germanic states; of which a very considerable part is already in a forward state of construction. Although these states are united by community of manners, race, and language, yet, being under different sovereigns, and subject to different administration, they have not proceeded with this great improvement with that unity of design which has marked the proceedings in France.—Each government has acted for itself independently of the others. Nevertheless, partly from the physical character of the countries, and partly from the distribution of the population and seats of industry, and a consequent harmony of interests, these separate and independent measures have of themselves assumed a considerably uniformity of plan; and the Germanic states will, ere long, be

overspread by one of the most magnificent systems of interior communication of which Europe can afford any example.

The Austrian system consists of what may be called four great arteries or lines, which meet at Vienna; and from thence proceed north, south, east, and west. The southern line, passing through Gratz and Laybach, terminates at Trieste. The northern directs its course by Prague, on the frontiers of Saxony, throwing off a branch to form a union by Olmutz with the great line through Prussian Silesia. These two lines, running north and south, are destined to form part of a more extensive medial line, by which the Adriatic will be united with the northern seas.—The two arteries which run east and west will connect Vienna with the confines of Hungary by Pesth and Debreczin, and with Munich, by Lintz. By these a profitable communication will be opened with those rich and hitherto inaccessible tracts of eastern Europe intersected by the valley of the Danube, possessing vast pasturages, regions fertile in wheat, maize, and rice, flourishing plantations of hemp and tobacco, and extensive vineyards.

Nor has Austria neglected to extend similar improvements to her Italian possessions. A line of railway, measuring nearly two hundred miles, will traverse the Lombardo-Venetian territory, connecting Venice with Milan, and communicating by easy steam navigation with the terminus of the great northern and southern line at Trieste. That the Austrian government may have been moved to confer this great benefit on northern Italy by other motives than those of a desire to promote the well-being of its people, is very possible; but, be this as it may, results greatly beneficial to them must ensue.

We here annex a view, taken from recent documents, of the actual state of the railways within the Austrian dominions:

	Total length Miles.	Complete and open for commerce Miles.
Vienna to Trieste (finished to Gratz) .....	335	148
Northern line .....	497	190
Vienna to frontier of Bavaria .....	194	16
Eastern line .....	311	84
Venice to Milan .....	190	19
Vienna to Timan by Presburg .....	51	51
Grunden to Prague by Lintz and Budweis .....	286	156
Budweis to Prague .....	71	
Total .....	1935	664

In the system of railways projected by Prussia is apparent the combined views suggested by the military traditions of its former sovereigns, and the commercial spirit of northern Germany, of which it is the centre. To throw its distant provinces, bordering on the constitutional states of Belgium and France, in more immediate relation with the central government, lines issuing from Berlin will rest upon the Rhine at Cologne and Frankfort-on-the-Maine; the one communicating with the network of Belgian lines, by the railway to Aix-la-Chapelle, and the other with the French lines by the railway of the Taurus. The former is completed, with the exception of the line between

Cologne and Minden. Another main line issues from Berlin eastwards, directed towards Russia and the Polish provinces, by Frankfort-on-the-Order, Posen, Dantzic, and Konigsberg. The line is in a forward state of progress.

There are three other lines partially or totally executed. Two proceed from Berlin to Hamburg and Stettin respectively, and the third will put the capital in immediate communication with Silesia, and unite with the great northern Austrian line already mentioned. It is in this way that the continuous communication between the Mediterranean and the North Sea and the Baltic will be completed.

	Total length. Miles.	Length open for traffic. Miles.
Berlin to Stettin.....	89.....	89
" to frontier of Saxony....	94.....	94
" to Austrian frontier by Frankfort and Breslau.....	323.....	240
Breslau to Saxon frontier.....	66.....	25
" to Fribourg.....	36.....	36
Berlin to Potsdam and Magde- burg.....	80.....	16
" to Hamburg.....	174.....	
Leipzig to frontier of Brunswick	110.....	110
Cologne to Belgian frontier....	54.....	54
" to Bonn.....	20.....	20
Dusseldorf to Elberfeld.....	17.....	17
Total.....	1063.....	701

Besides these, which are already planned and in actual progress, there are several other lines in contemplation by the Prussian government. Among them may be mentioned a more direct line from Berlin to Dresden, by Iuterbogt and Riesa; the line from Cologne to Minden, and the line from Lippstadt to Cassel.

We have lately seen the traffic returns and other accounts, to 31st December, 1845, of eleven principal Prussian lines, which were open throughout that year—the total length of which is 600 miles. The total cost of constructing these has been \$5,640,000, being at the rate of £9400 per mile. The gross receipts for passengers was £306,570, and for merchandize, £179,980. The number of passengers booked was 5,006,814. The amount, therefore, received per passenger was 191. Thus the average distance travelled by each passenger does not exceed twenty miles—showing again that short fares are the main source of railway revenue. The quantity of merchandize transported was 475,000 tons, for which £17,980 were paid; being at the average rate of 7s. 6d. per ton. Taking the average rate of the traffic at 2½d. per ton per mile, this would show that the average distance to which the goods have been transported was thirty-six miles. The expense of working these lines was £285,000, which, deducted from the gross receipts, left a net profit of £201,550, giving a dividend of 5½ per cent. on the capital: a portion of the expense of constructing the lines was defrayed by loans obtained at 4 per cent.

The Bavarian system of railways consists of three great trunk lines, which intersect the kingdom in different directions. The first rests at one extremity on the Lake of Constance, at Lindau; and at the other, unites with the Prusso-Saxon system at Hof—tra-

versing in its course, Augsburg, Donauworth, Nuremberg, and Bamberg. A great portion of this line is open for traffic. The second line crosses the kingdom east and west; joining, on the one side, the railways of Wirtemberg and Baden, and on the other, those of Austria. The third great line issues from Bamberg to Frankfort-on-the-Maine, where it unites with the numerous systems centering there.

Of this system of lines, the total length is 573 miles. Length of the part open for commerce... 159 "

The enlightened zeal of the present monarch of Bavaria for every improvement which tends to advance the arts and civilization, is well known. He appropriates each year, to the construction of this system of railways, a considerable revenue saved from his privy purse, and the public revenues of his kingdom.

The measures adopted by the more considerable of the Germanic states for the establishment of improved means of internal commerce, necessarily gave a corresponding impulse in the same direction to the smaller ones. Saxony and Hesse have undertaken the continuation of the great northern Bavarian railway from Hof to Leipzig by Dresden. Lines are also in progress connecting Dresden, Gorlitz, Chemnitz, Riesa, Bamberg, and Eisenach: also Dresden with Prague, Cassel with Frankfort-on-the-Maine, Lippstadt, and Hanover. These small states have planned above a thousand miles of railway; more than one-fourth of which is completed, and open for commerce.

The smaller northern states—Hanover, Brunswick, Mecklinburg, and the Hanse Towns—have not been backward in contributing their quota to this vast work. By a law passed by the legislative chamber of Hanover in 1842, the construction of a system of railways in that state was decided on. The main line is to run east and west, connecting Hanover with Brunswick, Magdeburg, and Minden. Another is directed northward upon Hamburg by Luebourg and Zell; another northwest on Bremen, and a short line to unite with the Cassel railway. These lines are all in a state of advancement, and considerable parts are already open for commerce.

In the Duchy of Brunswick, with a population not greater than an eighth of that of the British metropolis, there are already seventy-five miles of railway completed, or nearly so. The Duchy of Mecklinburg is traversed by the main line of railway from Berlin to Hamburg, and by a branch connecting Weimar with Berlin by Schwena and Boetzenburg.

The Hanse Towns form a common centre for most of these lines; and in immediate connection with them is the important line from Altona to Keil, with branches on Schleswig and Tonningen.

The total length of railways projected in these smaller states is 700 miles; of which about one-third is open for traffic.

To complete this view of the German railways, it remains to notice those of Baden, Wirtemberg, and the free city of Frankfort.

The great Baden line runs parallel with the Rhine, forming the continuation of the line from Cassel through Frankfort and Darmstadt. This line, which terminates at Bale, passing through all the chief towns traversed by the Berg Strasse, and lying between the Rhine and the Black Forest, is open for traffic throughout nearly its entire extent. Its object is to facilitate the communications of Germany with Switzerland and Italy. Another line, traversing Wirtemberg from south to north, issues from Frederickshofen on the Lake of Constance, meets the Austro-Bavarian line at Ulm, and, passing through Stuttgart, terminates at Heidelberg, where it unites with the great Baden railway. Thus will be united Vienna, Munich, and Stuttgart, the three capitals of southern Germany; while a similar chain of lines unites Berlin, Warsaw, Dresden, Hamburg, and other capitals of the north. The total length of railways projected by Baden, Wirtemberg, and Frankfort is 500 miles, of which above 200 are completed.

According to the work of Baron Von Reden, to which we are indebted for much valuable information concerning the railways of his country, the entire system of Germanic lines, when completed, will consist of 1600 German lines, equal to 7600 British miles of railway. At the close of 1845, the part of this open for traffic was 4760 miles.—When the system shall have been completed one third will have been constructed by the state, and two-thirds by companies under the authority of, and subject to, the control of the state. The total amount of capital absorbed by this great undertaking will be £74,793,600, being very nearly at the rate of £10,000 per running mile. The average cost of the part already constructed has been very little above £8000 per running mile.

The low cost of construction, as compared with the railways of France and England, is due, in a great measure, to the low price of the land, and the inferior rate, generally, of the wages of common labor. On the other hand, however, the German states have to struggle with peculiar disadvantages. The country, in many places, has presented formidable engineering difficulties. The rails and road materials generally, as well as the machinery and the mechanicians, have to be imported from England and Belgium, and even from the United States of America.—And the favorable circumstance of cheap hand labor has been, in some degree, done away by the demand for it, created by the railways themselves. In 1844, eight millions of laborers were employed on the German railways; and their wages had then risen thirty-three per cent. Still the works proceed with speed and activity.

A movement affecting in so many important respects the social condition and commercial relations of states, could not take place among those to which we have adverted, without being shared more or less by the other countries of Europe, Russia, Denmark, Holland, Switzerland, the Italian states, and even the Peninsula, have shown signs of their consciousness of the expediency of some

similar undertakings. Several of them have already taken active measures in the construction of lines through their respective territories; and those which have not gone so far have caused surveys to be made, and other preliminary steps to be taken. Sweden stands alone quiescent among the nations of Europe.

The system of Russian railways projected, and in progress of construction, consists of principal lines. The first will be carried from St. Petersburg to Warsaw, and thence to Cracow, where it will unite with the northern chain of German lines; thus opening a continuous communication with all the chief cities of central Europe. Of this line, a large part of the section between Warsaw and Cracow is completed, and the remainder in a forward state of progress. The second line will connect Petersburg with Moscow; this is nearly completed. The third line will be the continuation of the Austro-Hungarian line to Odessa. The fourth line, intended for goods only, will connect the Volga and the Duna. The total length of this system of railways will be sixteen hundred miles.

The example of Belgium necessarily attracted the attention of Holland to the subject of railway communication, and suggested the policy of at least attempting to share that German traffic which was established between the northern country and the sea, by the Belgian and Prussian chain of railways. The Dutch Chambers were not, however, as keenly sensible of these advantages as the sovereign, and decline to give the desired legislative encouragement, to such enterprises. Under these circumstances, William I. gave his personal guarantee to a company which undertook the line from Amsterdam to Rotterdam; which was opened in successive sections to Harlem in 1839, to Leyden in 1842, to the Hague in 1843, and Rotterdam in 1844. The length of this line is fifty-three miles, and is laid down for a double line of rails; one line, however, being only laid for the present. The cost of the line (with two lines of rails) will be little more than £5000 per mile, exclusive of the stock. This low cost is owing to the easy nature of the ground, which requires no engineering works of any considerable cost.

To be continued.

#### Iron Ore in Maine.

Dr. JACKSON, in a late report of his Geological Surveys in the state of Maine, alludes to an iron mine at *Raymond*, in Cumberland county. At this time, says the Advertiser, when the subject is exciting the attention of the community, his views are worthy attention. The doctor says:

Raymond, on the borders of Sebago Lake, was our first stopping place for the first day's route. Here we proposed examining an iron mine of some note, and to explore the vicinity for other useful minerals.

Specimens of magnetic iron ore, from Davis' Hill, in Raymond, having been sent to me for analysis, I was desirous of examining the locality where it was found, for the purpose of ascertaining whether a sufficient quantity of the ore could be obtained to render it of economical value. At my request,

several gentlemen of Raymond accompanied me to the spot, which is a mountain situated in the northeast part of Raymond, six miles from Sebago Lake and three quarters of a mile northwest from the head of Great Rattle Snake Pond. The hill is an abruptly precipitous mass of rocks, covered with a scanty soil, bearing a few small forest trees, and attains an elevation of 371 feet above the level of Rattle Snake Pond. The rock which contains the iron ore, is a huge bed of green epidote rock, containing also many scattered crystals of black hornblende, and the iron ore occurs in sheets of veins, closely implanted, measuring from one to four inches in thickness. They are closely attached to the rock, and were evidently formed at the same time with it, since they are so intimately blended. Owing to this close attachment, it is difficult to extract the ore without quarrying out large portions of the matrix, which in working should be broken off, so as not to encumber the furnace with useless matter.

There is evidently a sufficient quantity of the iron ore in this mountain to supply a blast furnace, but it will cost much labor to extract it from the rock. I would not, however, abandon the locality, without making a trial of the quantity of picked ore which a laborer can blast out and clean for the furnace in a day; for if it should prove that one man can earn fair wages at the work, as many hands can be employed as might be required—for there is ample room on the face of the cliff for all the laborers that might be necessary, since the bed is nine rods wide, and exposes the iron ore along its whole breadth. By chemical examination, it appears that the ore will yield, when free from the rocky matrix, seventy per cent of iron, and I should think that, picked as clean as might be required, it would give about fifty per cent. of cast iron, if wrought in the blast furnace. Should a less expensive investment be required, a bloom forge might be erected, and I have no doubt but an ample supply of the ore could be obtained to keep it in operation. Compact magnetic iron ore like this, work more easily in the forge than they do in a blast furnace, for they are so heavy as to overload the latter. In case a forge should be erected, it will be necessary to break the ore small before throwing it upon the fire, and if it is first roasted it will crush more readily. It may also be completely picked from its gangue, by means of a rotary wheel, made up of horse shoe magnets, as is done at some of the furnaces in New Hampshire.—Water power may be readily obtained near the hill, by means of a dam thrown across the stream from Dumping Pond; a head of ten or fifteen feet of water being, as I am informed, easily produced by this means.

Wood on the spot is worth seventy-five cents per cord, delivered, or twenty-five cents per cord for standing trees, and fifty cents for cutting and hauling to foundry. Lime-stone abounds in the town of Poland, six miles from this mine, and may be obtained for a flux in smelting the ore.

Transportation to Portland costs four dollars per ton, for ordinary merchandize; but

the iron being less bulky, could be carried for a less price. It may be carried upon the canal by hauling it six miles to Sebago Lake; or in winter, it may be transported upon sleds.

From the above elements, any iron master can readily calculate whether it would be profitable or not for him to work the Raymond iron ore.

#### Railroads in England.

The first railroad which was completed, and opened in Great Britain, for travel and the conveyance of merchandize, was the "Liverpool and Manchester" line—thirty miles long. It was completed in 1830. The extension of the system in Great Britain will be found below—in tabular form—and will be read with interest:

	Miles of railway.	Number of passengers carried.
1830.....	30 .....	.....
1840.....	1300 .....	12,000,000
1841.....	1550 .....	20,000,000
1843.....	1800 .....	26,500,000
1845.....	1900 .....	30,000,000

These roads cost three hundred millions of dollars, and most of them paid a large profit, so that the stock rose in the market to double the cost.

In 1845, 300 miles of new roads were put in operation and 1800 more undertaken.

The average cost of the roads completed has been \$168,000 per mile.

The items of this cost have averaged as follows:

Cost of land .....	\$19,200
Way and work .....	105,600
Office and sundries .....	4,800
Locomotive power and working stock ..	38,400

The cost of the wide gauge was more expensive, the 240 miles in operation having cost \$192,000 per mile.

What has been the service to the public and the revenue to the owners produced by these railroads?

The traffic for the three years ending 30th June, 1845, was as follows:

Year.	Miles of railway opened.	Receipts from passengers.	Receipts from goods.	Total.
1843..	1794..	\$14,929,233.	\$6,839,673..	\$21,768,907
1844..	1912..	16,508,611.	7,848,824..	24,348,435
1845..	2118..	19,086,435.	11,200,190..	30,286,625

From this table is deduced the following:

Year.	Am't passenger fare per mile.	Am't increase per cent.	Am't of goods per mile.	Ann. inc. per cent.	Total per mile.	Annual increase.
1843..	\$4,299..	...	\$3,781..	...	\$12,080..	...
1844..	8,510..	2.55..	4,110..	7.90.	12,620..	5.20
1845..	9,009..	5.87..	5,284.21.	34.	14,254..	10.70

The cost of running these roads averages about 42 per cent. of the gross revenue. The revenue from passengers is 63 per cent. and from freight 37 per cent.

The average distance travelled by each passenger in the year ending 30th June, 1845, was as follows:

	Miles.
1st class .....	26.7
2d class .....	13.4
3d class .....	11
Mixed .....	24.4
Mean distance .....	15

This proves that most of the money comes from the way travel, and from persons who travel but very short distances.

The saving to the public in travel is estimated in the Edinburgh Review, for the year 1844-5 at \$33,253,776. This embraces fare, time and tavern expenses.

#### (Official) Reading Railroad.

A comparative statement of the business on the Philadelphia and Reading railroad for the week ending—

	Dec. 28, 1844.	Dec. 27, 1845.	Dec. 26, 1846.
Travel .....	\$1,551 82	\$2,041 35	\$2,536 14
Freight on goods ..	777 13	1,913 94	2,523 13
"    coal .....	2,402 10	5,908 93	21,849 38
	\$4,431 05	\$9,864 22	\$26,908 64
Coal trans.—tons.	2,139	6,095	15,422

Correspondents will oblige us by sending in their communications by Tuesday morning at latest.

### AMERICAN RAILROAD JOURNAL.

Published by D. K. MINOR, 105 Chestnut St., Philadelphia.

Saturday, January 3, 1847.

**RAILWAY IRON.—THE BEST QUALITY** of English Heavy H Rails—60 lbs. to the yard—now in store, landing from the vessel, and on ship board to arrive, for sale on most favorable terms by  
DAVIS, BROOKS & CO.,  
Jan. 2. [14] 65 Broad St., New York.

### The Railroad System and the Railroad Journal.

As the one prospers, so prospers the other. Few of those now interested in the success of the railroad system, appreciate fully its influences, and its probable extension. Nor, indeed, are there many, who have witnessed its progress from its first introduction, who can refer to their "Journal" of passing events and trace its astonishing extension within the last eighteen years.

On the first day of January, 1829, there was not a railroad in operation upon which locomotive engines were successfully used as the propelling power—and it was not until October, 1829, that this power was brought to anything like a successful application; and even then *twenty tons on a level road*, at *ten miles an hour*, was the extent of the requirements of those who were in advance of the age in such matters! And even this degree of confidence in their power was confined to a very few persons in England; while in all Europe beside, and, with here and there an exception, in this country, they were as little thought of as the *Magnetic Telegraph* in 1840!! and yet, at this date, a locomotive, even of American manufacture, which will haul from a *thousand to twelve hundred tons* on a level road, at the same speed, is no uncommon machine!!! Such, indeed, have been the improvements in the construction of railroads and railroad machinery, that they are becoming the principal and most economical means of travel and transportation in this country, as well as in Europe; and it is therefore of the utmost importance that, in the construction of our long, and connecting, lines between the Atlantic and the western waters, we avail ourselves of the improvements of the present day in all Europe, as we did of those in England of 1829.

When we take a glance at the vast extent of our country—even as it was before the commencement of the present extension of its limits—and of the present condition and prospects of its numerous railroads, we cannot but view the introduction of the system as the means—greater than any, we may say than all other—of perpetuating our glorious union. It will prove literally, we doubt not—if properly carried out—as bands of iron binding us together, a family of states—thus ensuring our greatness and permanence as a nation.

If the construction of a single line of road from

tide water on the east, to the waters of the great lakes, or mighty rivers on the west, commands the admiration of all intelligent men—how much more will the completion of the numerous lines now in progress, and in contemplation, excite the wonder of the age in which we live.

When the line from Portland to Montreal, and from Boston to the same point, as well as to Burlington, Vt., and Ogdensburg, N. York, are completed; and when the New York and Erie to Dunkirk, and the Central Pennsylvania road to Pittsburg, and thence to Cleveland, and thence to Cincinnati, Ohio, are in use; and when the Baltimore and Ohio road, and the Richmond, Va., and Ohio road shall reach the Ohio river; and when the Carolina road from Charleston, through Georgia and the Central road, from Savannah, shall reach the Mississippi and the Gulf of Mexico—we say when these lines are completed, together with their numerous lateral and connecting roads—as they surely will be within the next twenty years—then we shall be able to appreciate with some degree of accuracy the utility and importance of the railroad system in this country. These lines, when completed, will be, it is evident, only the commencement of the system on this continent; and that, unless some other mode of travel and transportation be discovered as superior to it, as it is to its predecessors, the construction of railroads will be continued "until every town of any considerable importance in the country will have its railway facilities," and until the distance between the two oceans is traversed by more than one line of "iron horses." Indeed, when we look back upon the success of its infancy, we are disposed to think him a bold man who dares to predict from the past, the results even of its manhood to say nothing of its maturer years.

Enterprising these views in relation to the system, and its extension, we shall endeavor to make the Journal, in some measure, instrumental to its improvement and advancement—and we shall be much more able to do so if the profession and others connected with the management of railroads and their machinery, will make it the medium of their communications with the public. Let each one who has the volume of experience open before him, contribute a page, or even a column of facts annually, and thus the Journal will be what it should be—useful to all who may read it.

It may not be improper to say here, that we shall have the aid of able assistants in the editorial department, and that we hope to make it quite acceptable to its patrons during this, its *sixteenth* year of publication. And, while we desire gratefully to acknowledge the many obligations we are under to the profession and the friends of the Journal, may we not still look to them for a continuation of their efforts to extend its circulation and usefulness? All communications for the Journal should be hereafter addressed to the Franklin House Philadelphia, where we shall at all times be pleased to meet our friends.

### The Magnetic Telegraph.

W. B. LLOYD, Esq., the agent of the new company for the establishment of the magnetic telegraph from Washington to New Orleans, was recently in this city upon business connected with this matter. We are informed that a contract has been entered into by the patentees of Morse's Telegraph, to establish this line by way of Charleston, Mobile, and numerous other intermediate points of commercial interest. Books of subscription to this stock, the whole amount of which is estimated at less than \$200,000, will soon be opened in this city, and the great importance of the line, will, we feel

confident, commend it to favorable consideration.

It is thought probable says the North American, that Congress may take some action on the subject and aid its speedy construction as a war measure, in the way of loan, for it would place the cabinet at Washington in almost immediate communication with the army and navy in the Gulf, and incalculably facilitate all operations.

The telegraph is destined to wield a mighty influence in the commercial world; and it seems to us that merchants should be the most anxious to further its extension. Its days of experiment and the thousand difficulties attendant on all new discoveries, have been overcome, and hereafter, it will be looked to, not only as a useful but a profitable investment. In point of importance, no terminus will be more valuable than New Orleans, and if the different companies, now rapidly forming, keep their charges down to the lowest rates, they will have as much business as they can desire.

It is hoped and believed that a sufficient amount of this stock will be taken up at once, say \$25,000, to enable the contractors to commence the line from Petersburg, Va., towards New Orleans, by the middle of March next. If Congress gives a loan to the company, as is expected, the whole line, from Washington to N. Orleans, can be finished in six months. There can now be no question that the stock of the Magnetic Telegraph is one of the most profitable of all the profitable investments which can be made; and as the invention is perfected, and all the difficulties attendant upon the early experiments are overcome, it is no longer a matter of doubt whether the thing will pay. There certainly can be no route which may be rendered more advantageous to those interested, in a pecuniary point of view, than that which connects the "Crescent City" with New York and the East! We learn from reliable authority, that the New York and Baltimore line of Telegraph, has earned its stockholders *ten per cent.* on their investment, for the last six months—equal to at least twenty per cent. per annum, though the line has been interrupted by breaks much of the time. The Albany and Buffalo line, we understand, is now paying 28 per cent. on the cost, or 14 per cent. to stockholders, and this, too, in its first year!

On the 29th ult., upon the opening of the branch line from Harrisburg to the Ohio river, a message in reference to the U. S. volunteers, was transmitted from Pittsburg to Harrisburg, thence to Philadelphia, thence to Baltimore, and thence to Washington, in *eight minutes*. During the existing war with Mexico, what estimate can be placed upon the value of this powerful agent, for the transmission of important news from New Orleans to Washington! Or what price may be set upon the utility of this invention in communicating intelligence from one extreme of the union to the other, so far as the interests of the mercantile community is, at all times, concerned! Its value must increase, and those who embark in it, cannot fail, we think, to reap a satisfactory profit.

The books of subscription have been opened at the Exchange in this city, and also at the Franklin House—and we have no doubt that Philadelphia will do her share in this great enterprise.

### A Chapter on Our Railroads.

Our exchanges teem with paragraphs and notices of the progress of the railroad interest, and we have never known a period when a more lively feeling has been exhibited in relation to this important subject, than the present. Below we give, in brief, such statements as have reached us through the press, from different points, during the past week.

The Burlington Free Press states that it is now the intention of the contractor of the Vermont Central railroad company, to push forward the work at that end of the line, without delay. Mr. Palmer, the agent of Mr. Belknap, is already on the ground with a gang of hands, making preparation for the steam excavator, which he informs us will be placed in the embankment north of our village, as soon as the necessary arrangements for its reception can be completed.

The stock of the Cape Cod branch railroad has nearly all been taken. A portion of it is under contract, and the whole line will be completed within the time named in the charter, thereby greatly facilitating the communication between the Cape and Boston, New Bedford, Providence and New York. The Yarmouth Register says its termination will not be long at Sandwich. The proposition to extend it to Yarmouth is already talked of. The editor is confident the road would pay ten per cent. on the estimated cost of \$225,000, and is willing to back his opinion by a liberal subscription to the stock.

It is understood from gentlemen who have just traversed the line of the Lewiston and Waterville railroad, that the movement is vigorously resumed, and the subscriptions will now be continued with all practicable dispatch. Certain questions, which caused a suspense for some days, have been adjusted by satisfactory explanations and assurances.—The most favorable feeling now exists in every town along the line, and entire confidence is felt, that the connections of the road will be adjusted with harmony and with a profitable regard to the general welfare.

A meeting of the board of directors of the Souhegan railroad, says the Amherst Cabinet, was held at Hardy's hotel on the 14th ult. James U. Parker, Esq. resigned the office of president and director of the corporation. Israel Fuller, Jr., was elected to fill the vacancy as director, and Barnabas B. David was chosen president. The surveyor stated that he should be able to make a full report of the survey in a few days. There is the utmost confidence in the success of this enterprise.

The Cleveland Herald is informed that one of the directors of the Cleveland and Columbus railroad company had an interview with the commissioners of Knox county, and some of the citizens of Mount Vernon a few days since, and after a free consultation with them, and an exhibit of the prospects and intentions of the company, the commissioners determined to appropriate the \$100,000 county subscription to the Cleveland line, if at an early day it was shown the road could be made to Mount Vernon by the aid of the Knox county subscription. The citizens of Mount Vernon will also add probably \$50,000 to the county subscription.

The Connecticut river railroad is now completed, and has been run over the entire length about a month. The business on it, so far, has exceeded the most sanguine expectations of its friends. It is thoroughly built, and bids fair to become one of the best stocks in the state. Its cost of construction, including the Chicopee branch, engines, cars, depots, and furniture, we understand, is about one million of dollars—\$650,000 of which have been subscribed and paid in. About one-half of the balance of the money has been borrowed, and it is proposed to provide for the other half by issuing new stock, for which a special meeting of the stockholders has been called.

We understand that Mr. Josiah Hunt has been selected as superintendent of the Connecticut river railroad. This appears to us to be a good selection

—we think Mr. Hunt will prove an efficient, faithful and popular officer. The duties of the office have heretofore, during the progress of the construction of the road, been discharged by the engineer.

The Fall river railroad will open on Monday next, when passenger trains will commence running through Middleborough, Bridgewater, East Bridgewater, North Bridgewater and Randolph, to connect with the Old Colony road at South Braintree.

Since the freezing of the North river, a considerable amount of merchandise and a large number of passengers have been transmitted to New York by the Housatonic railroad. The freight agent at Albany writes that he is daily receiving two thousand dollars worth of freight for the east, and it is accumulating very fast at Greenbush, so that his depot is overflowing with produce—pork, flour, wool, butter, cheese, etc. The cars and engines of the company will have full employment this winter.

The railroad commissioners upon the Montreal and Atlantic railroad have closed their labors, in laying out and appraising the land damages of this road as far as Sanbornston bridge. The Montreal road will enter the Concord road near the south end of the passenger depot. The right of way from Concord to Sanbornston bridge, most of which had been previously purchased, costs the corporation only about \$7,500—distance, 18 miles. The Concord railroad has tendered to the Montreal road the free use of their passenger depot in Concord for all purposes connected with that part of the business of the road.

The Keene, N. H., Sentinel remarks that, in view of the roads to be immediately put under contract above us, and to connect with ours, even to Ogdensburg, no one can estimate the vast amount of freight and passengers destined to go over it. We doubt there being a road in New England, even the Western that can compete with it. The key stones of the great bridge (a magnificent structure) over the east branch, in this town, were put in place last week, and the filling is now going on vigorously, as is the work on the whole line. The remaining sections to the Falls, we learn, are soon to be put under contract.

Upon the subject of the Oregon railroad, we find in the Rochester Democrat a statement that Dr. H. Carver, of Pittsford, an old resident there, has gone to Washington to procure a charter to build the Oregon railroad, by individual enterprise. Dr. Carver has long manifested a great interest in this important work, and claims that he is the original projector of the enterprise. This claim is supported by a mass of testimony that is quite convincing to those who have examined it. It appears that he wrote and published articles concerning the project long before it was bronched by Mr. Whitney, or any other person. He is confident that the road can be built by individual enterprise.

The Springfield Gazette says that "the anticipated construction, within little more than a year, of the New York and New Haven railroad, which will complete the chain of railroad communication between the two great commercial capitals, Boston and New York, is a matter, the importance of which to the travelling community, is not likely to be overestimated. The advantages of an inland route, especially in the winter season, are apparent to every one; and in summer, the trip through the heart of Massachusetts, down the valley of the Connecticut, and along the shore of the Sound, will present attractions for the traveller, such as no other route of travel in the country can afford.

"Notwithstanding other schemes that have been

or may be started, based upon the increasing preference for land over sea routes, the rapidity of communication upon this line when finished, will doubtless be adequate to any reasonable demand of the public. If deemed desirable, we understand the entire trip can be made in seven or eight hours by trains provided for the purpose, running at a speed of 30 or 35 miles per hour.

This, then, must be one of the favorite routes of travel and of business, both in summer and in winter, and while the subject is one of deep interest to the public, it is peculiarly so to the large towns and cities through which it passes, and to none more than to Springfield.

On the subject of "New England Railroads," the Boston Courier, of a late date, says that "the railroads diverging from Boston are all doing grandly. The Fitchburg's receipts last week increased \$1400 over last year's business, which yielded 14 per cent. dividends. The increase on the Western was \$5700. The annual railroad reports will soon be published, and distributed among the stockholders. The aggregates and details cannot fail to show satisfactory results for the past year, and encouragement for the future.

"The railway share market closed on Saturday at the following quotations, viz:

	Official	Asked.
Lowell railroad.... par \$500....	592½	600
Nashua ".....	100....123	125
Concord ".....	50.... 65½	66
Fitchburg ".....	100....120½	121½
Worcester ".....	100....116	116½
Western ".....	100....103	102½
Maine ".....	100....113	112½
Providence ".....	100....107½	108
Eastern ".....	100....106½	108½
Old Colony ".....	100....102	102½

The items here furnished, show a healthy and rapidly increasing traffic upon our railways, in all directions, and we are gratified to notice the good feeling exhibited by the press in every part of the country, upon this important subject—in which the whole community are directly, or indirectly, interested.

#### New York Railroad Legislation.

In "Hunt's Merchants' Magazine," for December, appears an ably written production from the pen of Vice-chancellor WHITTLESY, upon the subject of "New York Railroads." It is well worthy of perusal, and as it embraces many important suggestions and statistics which we consider valuable, we transfer, below, to our columns, such extracts as we deem of general interest. In alluding to this article, a contemporary remarks that it is now about twenty years since the construction of railways, on an extensive plan, was commenced in England; and the fact no sooner became known, than the enterprise, so congenial to the American character, became a leading one in this country. The work of constructing a railway was too great for individual enterprise; and as the state of New York had already incurred a large debt in a system of internal improvements, by canals, the work fell into the hands of corporations. This created the necessity for some kind of legislation. The magnitude and importance of railways were not at first understood. There were dim, misty, and indefinite views of the consequences of such structures; and not being able to foresee the utility of these works, legislators, as well as corporations, acted, to a great degree, in the dark.

The great central lines of railroads, from the Hudson to Lake Erie, are about the only dividend-paying roads in the state of New York. The course of legislation in reference to these roads, is the subject of discussion in the article referred to.

The distance, about 350 miles, is filled by eight corporations, viz:—Mohawk and Hudson, from Albany to Schenectady; chartered April 17, 1826.—Schenectady and Troy, from Troy to Schenectady. Utica and Schenectady, from Schenectady to Utica; chartered April 29, 1833. Syracuse and Utica, from Utica to Syracuse. Auburn and Syracuse, from Syracuse to Auburn. Auburn and Rochester, from Auburn to Rochester. Tonawanda, from Rochester to Attica; chartered April 29, 1833. Attica and Buffalo, from Attica to Buffalo.

The duration of all these charters is fifty years from the period of their enactment. All the companies except the three to which the dates of the charters are affixed, were chartered in 1834 and 1836. The restrictions as to carrying freight and passengers are as follows:

As to charges for the transportation of passengers, the Mohawk and Hudson is unrestricted: the Schenectady and Troy is restricted to six cents per mile per passenger; and all others but one, to four cents per mile per passenger, and the Attica and Buffalo to three cents per mile per passenger. Such are the provisions for guarding the public against exorbitant fares.

As to restrictions upon carrying freight, the Attica and Buffalo, the Tonawanda, and the Schenectady and Troy, were unrestricted; the Mohawk and Hudson cannot receive greater tolls than the charges for transportation on the Erie canal; the Auburn and Rochester cannot transport property when the Erie canal is navigable, so as to lessen the income on that canal; the Syracuse and Utica, and Auburn and Syracuse, are to pay tolls to the canal fund on property carried by them when the Erie canal is navigable; and the Utica and Schenectady cannot carry freight at all. These are the provisions for guarding the Erie canal against injurious competition with the railroads in the transportation of property. The Utica and Schenectady being wholly forbidden the carriage of property, and some of the other roads being restricted, by provisions more or less stringent, the consequence is, that none of the railroads carry much freight, and generally only that which moves between the interior and points on the canal, and which is of no injury to canal freights. This feature of railroad legislation was modified by an act passed in 1844, authorizing the Utica and Schenectady railroad to transport property in the winter, when the canals are closed. But this company pays tolls to the state equal in amount to canal tolls on all property it carries, and all the other roads pay such tolls upon all property which passes their respective roads, by reason of opening the Utica and Schenectady road to the carriage of freight.

The consequence of this legislation has been a considerable movement of property on the railroads during the winter months; but still, the whole freight upon all these railroads is quite trifling in amount.

The state claims the right of assuming some of the railroads, upon the following conditions:

In the case of the Mohawk and Hudson, and the Tonawanda, the state has the power of assuming the works, after ten, and within fifteen years, upon payment of the cost and

14 per cent interest, deducting income received; and as to all the other roads upon the line, on payment, in like manner, of cost and ten per cent interest. This provision insures the control to the state, in case it should find that the railroad corporations realized greater profits than it was for the interest of the public they should enjoy.

The following is suggested as the true policy of the state in reference to railroads:

The true legislative policy in regard to railroads, for the state of New York, is to inspire capitalists with confidence, by giving them an assurance, in some shape, that the rate of fares authorized by their charters shall not be reduced by legislation, and trust to the competition afforded by rival routes to insure that character of road, speed, and cheapness, which will be satisfactory to the public. Investments in the different routes will thus be secured and their natural competition will effect the desired results.

The following remarks on the subject of fares, are interesting:

The true medium, or just rate of fare, can only be satisfactorily ascertained by experiment. The managers of these different railroads are the proper persons to make the experiments. They are the persons equally interested in the result with the public.—They understand all the circumstances under which their business is transacted; and they know many things affecting the question which the public will not take the pains to know or to weigh. Common prudence would dictate that such experiments be made cautiously.

The experiment of reduction of fare upon all the roads of this line, was made in 1843. It did not succeed. The receipts did not afford a remunerating profit, and the season subsequent, the former rates of fare were restored. It has been supposed that a reduction to a sufficient extent would transfer all the passengers from the canal boats to the railroads. This we believe to be an error. The canal boats can carry passengers at lower rates than railroads, and the latter cannot reduce so that the former will not still be below them.—There is but little capital vested in a line of canal boats, but a very large sum in railroads. Competition would ruin the latter, without seriously affecting the former. Re-

ference has been frequently made to the Massachusetts railroads, to show the beneficial effect of low fares. The comparison is hardly a fair one. The Massachusetts railroads receive a large income from freight—the railroads under consideration comparatively nothing. These railroads must look to passenger fare for their whole income. Take from the Massachusetts railroads their freight, and they would scarcely be able to make dividends from their passenger receipts. The preceding table will show the comparative business of a number of companies in Massachusetts, with these railroads in New York.

We have not the least doubt, however, that as soon as the central line of road is reconstructed, with a heavy rail, it will be enabled to realize a profit at reduced rates. The increased speed and reduced rates together, will command an additional number of passengers, sufficient to compensate for the reduction. Nay, we are inclined to the opinion that even now, the fare may be somewhat reduced on the line, without injury to the income. Though the experiment of reduced rates was not successful in 1843, we believe it might be in 1847. The completion of railroads, through Ohio, and some other western improvements are calculated to throw a greater amount of travel upon this line; and a reduction might now be made, not with the idea of taking travellers from the canal, but to increase the amount of local travel and long travel. In our judgment, it would be both good policy and for the interest of this central line, before the close of the present season, to make arrangements to carry at some reduced rates for the ensuing season. This would show the public that they are really seeking to find the true medium rate of fare. The business of 1846 will show, probably, an advance upon the receipts of the previous year of more than 20 per cent. The prospect of the business for the year 1847, is still better.

The great obstacle to the reduction of fares, is the number of corporations on the line.—An amalgamation of the various companies, would produce unity of action and prevent many vexations, irregularities and failures. The following remarks in reference to the canals, will meet, we presume, with the cordial approbation of all:

There is an opinion entertained somewhat extensively that these railroads should be permitted freely to carry freight at all seasons of the year, without the payment of any tolls to the state. We cannot concur in such opinion. As long as the state of New York is heavily in debt for the construction of her canals, and as long as a direct tax is necessary to pay the interest of such debt, it seems quite right that the canal revenue should be guarded from any inroads by any competing lines. If under such exemption from tolls, the railroads should carry large amounts of freight, it would by just so much, impair the canal revenue, and render a tax to meet the canal debt just so much more the necessary. The carriage of property by railroads in the winter, when the canals are closed may, however, with great propriety be made free from the payment of tolls to the state. The amount so

transported will be comparatively small. It will consist, to a considerable extent of fresh provisions, poultry and articles of that character, which would otherwise not be transported at all. It is of great benefit to the public to have this transportation open. The collection of the tolls to the state is attended with some trouble and embarrassment.—These tolls are small in amount—the whole tolls of a winter not exceeding two days' toll upon the canal in the active part of the season—and are comparatively, not worth looking after, and might with great propriety, be relinquished.

The business transacted upon the railroads in New York, as well as upon the railroads in Massachusetts, in 1846, affords every encouragement to railroad enterprise. There have been an increased number of passengers, increased traffic, and increased earnings. This would naturally stimulate the construction of new road; and under the fostering care of a judicious legislation, the state of New York might be covered with an iron net work of permanently constructed railroads, developing its resources, facilitating its traffic and ministering to its wealth. The completion of these various works would be the effective coercion to accommodation, speed and cheapness. Under a legislative policy which should deter capitalists from railroad investments, the state of New York would fall quite behind her New England neighbors in the means of transacting business afforded by permanently constructed railroads. She would be arrested in the noble career open to her ere she had well entered upon it, and would be unable to reconstruct the present work, or enter upon any new enterprise. The whole state has a deep interest in the legislative policy which the state of New York shall adopt, and every one should throw in the weight of his influence to give it a wise and judicious direction.

#### Broad Gauge from Boston.

In the Boston Post a few days since, occurred the following editorial reference to railroad achievements in England—to which is subjoined, it will be seen, a suggestion of the adoption of the broad gauge for the projected air line road from Boston to New York.

The locomotives now in progress for, or already launched upon the Great Western or Exeter, Bristol and London railway, which is of the *cheval de bataille* of the broad gauge, seem to attract great attention from scientific and practical mechanics in England, France, etc. One is especially commended which performed the 193 3/4 miles between Exeter and Paddington in 211 minutes in one instance, and 214 in another, with a train of 140 tons beside the weight of engine and tender, which added 56 tons more with a full supply of coal and water. This engine has 8 feet driving wheels, 24 inch stroke, 8 inch cylinders, 15 1/2 feet length of tubular boilers, and weighs 36 tons without water; the tender 10 tons more—and when loaded, the whole gives an adhesive power of 56 tons. If the air line from this city to New York, is ever constructed as it should be, with a wide gauge, our Boston machinists, Hinckley &

Drury, will not flinch from a trial of speed with the above, with engines they could turn out.

This air line railroad to New York—adds an exchange paper—is now attracting a new attention, induced in part by the approaching session of the Massachusetts Legislature, and partly by the distrust of steamboat navigation on the Sound. A public meeting is called in Boston on the subject. The road is spoken of as one that is to be a straight and independent road.

The portions within the states of New York, Connecticut and Rhode Island, we believe are already chartered. The application for a charter within the limits of Massachusetts, will be renewed at the session commencing next month. The published petition prays for a charter, "with all the powers and facilities for constructing and opening a railroad upon improvements combining the greatest speed, safety and public convenience."

#### Bridge Across the Ohio.

In the last number of the Journal we alluded to this enterprise, and we are happy to see that the citizens of Cincinnati are alive to its importance.—We find in a late number of the "News," the following allusions to the plan, and to its projector, MR. ROEBLING:

This plan—as developed by a civil engineer, whose capacity and competence no one has denied or attempted to question—has likewise been described in most of the public journals in this region, and a large edition has been published and circulated in pamphlet form. It is evident, therefore, that the popular mind is properly informed upon the subject, and that if any well founded and substantial objections to the feasibility of the project, has been discovered, those most interested would not have remained uninformed of their character.

The only evidence submitted to the public calculated to destroy faith in the plan of Mr. Roebling, has been circulated in a memorial to the Legislature now seeking for signatures. This memorial has most likely been gotten up by speculators and property holders, who oppose the bridge from motives purely mercenary, and who would be sure to scrape together all facts or fictions calculated to aid their cause.

But—adds the News—there is another aspect, higher than all the rest, in which this question is to be viewed. All that is involved in the subject is not embraced in the inquiry whether the vacant lots of Smith above the city—the subdivision of Brown below the city—the commons of Thompson in the rear of the city, or the real estate of Green in the city proper—is to be diminished in value; whether the ferry of Jones, or the wharf of Gray, is to lose a share of the profits it has enjoyed; whether Simpkins & Co., on the opposite side of the river, are likely to reap the benefits of the change in the increased value of the soil that happens to be in their possession. The people at large are interested, most deeply interested, in the settlement of the question; the universal good must be consulted, whatever partial evil may be inflicted. We believe it is not denied in

any quarter, where pretensions to common sense are preferred, that the construction of a bridge across the Ohio river at this place, which shall not interfere with the free navigation, and which will become a safe passage at all times, day and night, to all who have occasion to cross, will be a work of such magnificence in its utility that it will reflect honor on the head that conceived the plan, and the hand that carried it into execution.

The cities of Covington and Newport are natural suburbs of Cincinnati—they are a part and portion of us—their citizens are our citizens. Shame on the narrow minded shallow policy that would attempt to keep us forever asunder, when nature has said that we should be members of the same common family!

Let the action of our Legislature, then, be governed by a keen anxiety to consult the just interests of all classes and by the purest principles of practical republicanism. Go for the good of the whole—of the mass—not to perpetuate the lucky and crafty few in their privileges. And if our Legislature will look at the subject with open eyes and not through the spectacles which have been placed on their noses by some of their very disinterested friends, we entertain no doubt that a bridge not at all interfering with the interests of commerce, will be finished across the Ohio, in less than five years. If the work can be thus accomplished, the benefits are incalculable—the evil effects so trifling, as not to be worth taking into consideration.

#### Railroad to Albany.

The feeling of the community is at length beginning to be aroused in regard to this important work and it is high time that it should be so; it has been suffered to remain dormant too long.

Several articles have recently appeared in the public prints, setting forth the various pretensions of the two rival roads: the contemplated 'Hudson River' and the 'Harlem.' To any one of a sound reflecting mind, who has taken the trouble of investigating the matter at all, there is probably no longer any doubt which of these lines ought to have the countenance and support of the community; but it is to be feared that there are comparatively few of those, and too many who are entirely ignorant of the relative advantages which one of these routes presents over the other. Why will such persons suffer themselves to be imposed upon by misrepresentations of interested parties, rather than listen to facts, and look into the merits of the undertakings for themselves? That a railroad is needed between New York and Albany, no one disputes, but is it not also essential that it is built in the most approved and substantial manner, and on the line best calculated for the business to be done on such a road, with economy and speed?

It is admitted that the highest grade on the proposed Hudson river road is 17 feet per mile only, against 35 feet on the Harlem, or interior route; and sufficient importance cannot be attached to this fact, for as competent engineers have shown, a locomotive of 15 tons weight will draw a load of 225 tons on

the river route, while the same locomotive could draw 146 tons only on the Harlem—thus proving that it will cost about fifty-three per cent. more to transport goods and passengers over the Harlem than over the river route. This argument in itself seems so important and conclusive that it certainly deserves a great deal more consideration than appears to be bestowed upon it.

Why meddle with a project exhibiting such disadvantages as the Harlem concern does, (independent of their otherwise embarrassed condition,) when one infinitely superior is offered? The names of the gentlemen connected with the proposed river route are a sufficient guarantee that they will carry out what they undertake—only give them the opportunity to do so, and that now rests with the community.

The navigation of the Hudson is closed for the season, and usually remains so for nearly four months. Now is the time when the want of a good railroad to Albany is more apparent than at any other. Citizens of New York, do not suffer this all-important work to the prosperity of this great city to slumber any longer, but come forward and subscribe, and liberally too, to the stock of the proposed Hudson river railroad, and rest assured that none of you will ever regret having lent a hand to so noble and important an undertaking.

These remarks are penned by one who has no other interest in the matter than the welfare of the city, and that in common with many others, as a merchant.—*N. Y. Com.*

#### New York and New Haven Road.

A late number of the New York Express, in an article upon the Erie railroad and other enterprises of this character, alludes as follows to the New York and New Haven road:

The next work in point of magnitude is the New York and New Haven railroad.—This road when completed, will connect the city with the Housatonic road at Bridgeport, thus giving us a line to Albany and the great west. It will strike at New Haven, the road to Hartford and Springfield, and from that point connect us again with Albany, and with the road to Boston, as well as with the road stretching up the valley of the Connecticut river to Vermont and New Hampshire. The importance of this link in the chain of communication has never until now been properly estimated. The distance is less than seventy miles, and a great part of the way on a dead level. It will pass through one of the most densely populated portions of the country. Some of the towns, particularly Stamford, Newark, Bridgeport, Fairfield, Stratford, are larger than some of our cities. This work is now begun in good earnest. A number of wealthy individuals, instead of throwing the work on the public to become a football, to be kicked about by stock jobbers in Wall street, have taken hold of it in a proper manner. They have taken most of the stock themselves, with the intention of keeping it and carrying it above par. The road is now under contract, and in about a year will be completed. Its cost will be about two and a half millions of dollars. The stock is so far

held by rich men, and instead of going a begging is sought after.

The disaster which has recently befallen the Atlantic, will contribute greatly to the completion of the work. The public now see in a new light its importance. If this road were finished at this time, the travel would be immense. One year, or at most two will see this important work completed, and then we shall have a continued line from the extreme points of Portland, in Maine, with all the varied lines in Boston, and to Buffalo, through Albany, Bridgeport, &c.—This will truly be an important link in the connecting chain of railroads.

#### Miscellaneous Items.

*The Chesapeake and Ohio Canal.*—Some of the papers on or near the line of the canal have expressed strong hopes of the completion of the canal under the present contract. We believe that we are correctly informed as to all that has been done and is now doing in relation to this great improvement, and, without wishing to excite any false expectations, we would remark that the prospect of completing the canal at an early day is certainly more flattering at present than at any time since the suspension of the work.—*Cumberland Civilian.*

H. Downing, Esq., president of the Atlantic and Ohio telegraph company, was at Cincinnati last week, and informed the Gazette that arrangements were in progress for extending the line from Pittsburg via Wheeling, Zanesville, Columbus and Dayton, to that city, and thence to Louisville and St. Louis. It is designed to have the line to Cincinnati in operation in May and June next. If Professor Morse invented the means to annihilate space and time, it is very evident that the indefatigable Henry O'Reilly has been equally fortunate in furnishing the means to make the discovery available to practical purposes.

*The Broad Gauge.*—The editor of the Bangor Courier gives his opinion with regard to the construction of railroads upon the broad gauge principle, so that freight and passengers cannot connect with the roads from the west without transshipment; that the people in that portion of the state are almost wholly in favor of the ordinary gauge, and not the broad gauge. No delay or interruption at Portland or elsewhere, "seems to be the prevailing opinion."

*Steam Communication with the West Indies.*—The Royal Gazette of Bermuda contains a prospectus of the West India and United States steamers. The company proposes that every two weeks one of the steamers will leave Demerara for St. Thomas, touching at Trinidad, Tobago, Granada, Barbadoes, St. Vincent, Antigua, etc. On the other hand, a steamer will leave Vera Cruz every two weeks for St. Thomas, touching at one or two ports of Cuba, at one port of Jamaica, at Cape Haytien and Puerto Rico. Upon the arrival of the two steamers from Demerara and Vera Cruz at St. Thomas, their passengers and merchandise will be transferred to steamers of a larger class, to sail thence for

New York, touching at Bermuda. It is the intention of the company to have the boats reach New York in season to connect with the steamers which will leave there for Liverpool. Upon the arrival at New York of the mails from England, the West India boat will depart for St. Thomas, touching at Bermuda.

*Machine for Pressing Brick.*—The Ledger states that a model of a machine for pressing brick is at present exhibited at the Exchange by the inventors, Messrs. Culbertson, McMiller & Co., of Cincinnati, who have it in practical operation at that city. It consists of a frame containing 14 moulds, which are filled with dry clay from hoppers on either side of two rollers, the upper one giving a pressure of 100 tons to each brick, as the frame work is worked backwards and forwards beneath it, by the application of steam or any other power equal to the task of moving the machine. Each brick passes twice beneath the roller, rendering the pressure equal on all sides, and is then raised above the upper surface by the action of parallel levers on the movable bottom of the mould, and are pushed over to a side table by self-acting machinery, which flies back to its former position; the reverse action of the wheel then commences, the bottoms of the moulds sink down, and are again filled as they pass beneath the hopper. If more material is pressed into the mould than is sufficient, a knife ranging with the surface shares off the surplus. When driven by steam, and with two men shovelling the clay into the hoppers, two more taking the pressed bricks from the table, and another wheeling them off into the kiln, from 30 to 35,000 can be made in a day of 10 working hours. In the long days of summer as much as 40,000 can be produced ready for the kiln. This machine offers many advantages, and not the least is that the brick it produces must be very firm from the enormous pressure employed in its manufacture. This method of making brick affords great economy of time, owing to its operations not being circumscribed by frosty or rainy weather; and as the bricks go immediately from the machine to the kiln, there is no extensive yard room needed for spreading them out to dry.

*Wabash and Erie Canal.*—The Cincinnati Gazette of Thursday says: Mr. Charles Butler passed through the city yesterday, on his way to Indianapolis. We are well pleased to learn that the subscription required for the completion of the Wabash and Erie canal has been filled up by the holders of Indiana bonds. We cannot see any room to doubt now that the arrangement for the state debt of Indiana, proposed in the act of last winter, will be fully carried out. Some light modification of the law of last session is necessary, but we have full confidence that all well wishers of the good name of Indiana, be they Whig or Democrat, will unite in all proper measures to bring this business to a speedy termination. It can now be done with honor; but if this arrangement is defeated, it will be long before the credit of the state is restored, if it ever is. Let the credit of this noble state be preserved.

**The Miami and Erie Canal.**—We are informed by Mr. Lapham, the collector of tolls in this city, that the acting commissioner has given directions to the superintendents on this canal, south of Dayton, to provide ice boats, and to keep the navigation open as long as possible by breaking the ice as fast as it accumulates.

The business on this canal the past season has been considerably greater than that of the year previous, notwithstanding the disadvantages to which it was subjected by breaches, and the competition of several routes.—We likewise understand, and are much pleased to hear, that the board of public works have it in contemplation to make a further reduction of tolls for the next season's operations, and to make some improvements to the canal for facilitating the business, with a view to increasing still further the amount of transportation on this great thoroughfare of the commerce of the west.

The magnetic telegraph is now in complete order between Toronto and Hamilton. On Saturday afternoon communications were made between the sister cities, when the mayor of Toronto sent his compliments to the president of the board of police here, congratulating him on the intimate connection now existing between them, consequent on the erection of the magnetic telegraph, which courtesy was promptly reciprocated, and compliments interchanged. A number of communications were then made between the parties in the different offices. The instruments, we understand, worked remarkably well. It is expected that in the first week in January, the whole line between Toronto and Buffalo will be finished and in operation. The wire is to cross the Niagara river at Queenston. A single wire only is used, being all that is necessary, but which is stronger than has been heretofore in use.—*Hamilton Gazette.*

**Submarine Explosions.**—The London Globe states that the Harbor Master of the Thames, Capt. Fisher, has, within the last few days, completed the removal of three sunken wrecks, which have for some considerable time greatly impeded the navigation of the river in the Lower Hope. Their removal was effected by submarine explosions, of various charges, averaging from 50 to 500 lbs., fired by means of galvanic battery. In the case of the larger explosion, a remarkable incident occurred at the moment of firing. An immense shoal of fish was passing the spot, and nearly the whole of them were blown out of the water to the extent of near 80 feet, the circumstances being followed by the raising of a huge column of water to about as great an altitude, which emitted a large portion of the destroyed wreck as it from the force of a volcano. The river from London bridge to the Nore is now perfectly free from all obstruction. The dangerous shoal of hard shingle off Lime house reach, which stopped the navigation of vessels of a large draught at low water, has recently been removed by the same means. The depth of water has been increased from 4 to 17 feet at low water.

**SPRING STEEL FOR LOCOMOTIVES.**—Tenders and Cars. The Subscriber is engaged in manufacturing Spring Steel from 1½ to 6 inches in width, and of any thickness required: large quantities are yearly furnished for railroad purposes, and wherever used, its quality has been approved of. The establishment being large, can execute orders with great promptitude, at reasonable prices, and the quality warranted. Address

JOAN F. WINSLOW, Agent,  
Albany Iron and Nail Works,

**RAILROAD IRON.—THE NEW JERSEY** Iron Company, Boonton, N. J., are now preparing to make Railroad Bars, and are ready to take orders or make contracts for Rails, deliverable after the first of December next. Apply to  
FULLER & BROWN, Agent,  
No. 139 Greenwich, corner of Cedar street.  
September 18, 1846. 1039

**NICOLL'S PATENT SAFETY SWITCH** for Railroad Turnouts. This invention, for some time in successful operation on one of the principal railroads in the country, effectually prevents engines and their trains from running off the track at a switch, left wrong by accident or design.

It acts independently of the main track rails, being laid down, or removed, without cutting or displacing them.

It is never touched by passing trains, except when in use, preventing their running off the track. It is simple in its construction and operation, requiring only two Castings and two Rails; the latter, even if much worn or used, not objectionable.

Working Models of the Safety Switch may be seen at Messrs. Davenport and Bridges, Cambridgeport, Mass., and at the office of the Railroad Journal, New York.

Plans, Specifications, and all information obtained on application to the Subscriber, Inventor, and Patentee  
G. A. NICOLLS,  
Reading, Pa.

**RAILROAD IRON.—THE SUBSCRIBER'S** New Rail Iron Mill at Phoenixville, Pa., is expected to be ready to go into operation by the 1st of September, and will be capable of turning out 30 to 40 tons of finished Rails per day. They are now prepared to receive orders to that extent, deliverable after the 1st of October next, for heavy rails of any pattern now in use, equal in quality and finish to best imported.

**PIG IRON.**—They are also receiving weekly 150 to 200 tons of No. 1 Phoenix Foundry Iron, well adapted for light castings.

REEVES, BUCK & CO,  
45 North Water St., Philadelphia,  
or by their Agent, ROBT. NICHOLS,  
79 Water St., New York

**THE SUBSCRIBERS, AGENTS FOR**

the sale of  
Codorus,  
Glendon,  
Spring Mill and  
Valley,  
Pig Iron.

Have now a supply, and respectfully solicit the patronage of persons engaged in the making of Machinery, for which purpose the above makes of Pig Iron are particularly adapted.

They are also sole Agents for Watson's celebrated Fire Bricks and prepared Kaolin or Fire Clay orders for which are promptly supplied.

SAM'L KIMBER & CO.,  
60 North Wharves,  
Philadelphia, Pa.

Jan. 14, 1846. [174]

**RAY'S EQUALIZING RAILWAY TRUCK.—THE SUBSCRIBER** having recently formed a business connection in the City of New

York, expressly for the manufacture of the newly patented and highly approved Railroad Truck of Mr. Fowler M. Ray, is ready to receive orders for building the same, from Railroad Companies and Car Builders in the United States, and elsewhere.

The above Truck has now been in use from one to two years on several roads a sufficient length of time to test its durability, and other good qualities, and to satisfy those who have used it, as may be seen by reference to the certificates which follow this notice.

There have been several improvements lately introduced upon the Truck, such as additional springs in the bolster of passenger cars, making them delightful riding cars—adapting it to tenders, trucks forward of the locomotive, and freight cars, which, with its original good qualities, make it in all respects the most desirable truck now offered to the public.

Orders for the above, will, for the present, be executed at the New York Screw Mill, corner 33d street and 3d avenue, (late P. Cooper's rolling mills) and at the Steam Engine Shop of T. F. Secor & Co., foot of 9th street, East

river, (of which firm the subscriber was late a partner) under the immediate supervision of Mr. Ray himself.

Several sets of trucks containing the latest improvements have recently been turned out for the New York and Erie railroad, and the New Jersey Transportation company, which may be seen upon said roads.

The patronage of Railroad Companies and Car Builders is respectfully solicited.

New York, May 4, 1846.

W. H. CALKINS, and Others.

To all whom it may concern:—This is to certify that the New Haven, Hartford and Springfield railroad co., have had in use six sets of F. M. Ray's patent trucks for the last 30 months, during which time it appears to me, they have proved to be the best and most economical truck now in use.

[Signed,]

WILLIAM ROE, Supt of Power.

I certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Philadelphia and Reading railroad for some time past, under a passenger car.

For simplicity of construction, economy in cost, lightness of material, and extreme ease of motion, I consider it the best truck we have ever used. Its peculiar make also renders it less liable to be thrown off the track, when passing over any obstruction. We intend using it extensively under the passenger and freight cars of the above road.

Reading, Pa., October 6, 1845.

[Signed,] G. A. NICOLL,

Supt Transportation, etc., Philadelphia and Reading Railroad.

To all whom it may concern:—This is to certify that the N. Jersey Railroad and Transportation company have used Fowler M. Ray's Truck for the last seven months, during which time it has operated to our entire satisfaction. I have no hesitation in saying that it is the simplest and most economical truck now in use.

[Signed,] T. L. SMITH,

Jersey City, November 4, 1845.

N. Jersey Railroad and Transp. Co.

This is to certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Long Island railroad for the last year, under a freight car.

For simplicity of construction, economy in cost, lightness of material and ease of motion, I consider it equal to any truck we have in use.

Long Island Railroad Depot,

[Signed,] JOHN LEACH,

Jamaica November 12, 1845.

Supt Motive Power.

### RICH & CO'S IMPROVED PATENT SALAMANDER SAFES.

Warranted free from dampness, as well as fire and thief proof.

Particular attention is invited to the following certificates, which speak for themselves:

#### TEST No. 10.

*Certificate from Mr. Silas C. Field, of Vicksburgh, Mississippi.*

On the morning of the 14th ult., the store owned and occupied by me in this city, was, with its contents, entirely consumed by fire. My stock of goods consisted of oil, rosin, lard, pork, sugar, molasses, liquors, and other articles of a combustible nature, in the midst of which was one of Rich's Improved Patent Salamander Safes, which I purchased last October of Mr. Isaac Bridge, New Orleans, and which contained my books and papers. This safe was red hot, and did not cool sufficiently to be opened until 16 hours after it was taken from the ruins. At the expiration of that time it was unlocked, and its contents proved to be entirely uninjured, and not even discolored. I deem this test sufficient to show that the high reputation enjoyed by Rich's Safes is well merited.

S. C. FIELD.

#### TEST No. 11.—Certificate.

By the fire which occurred in this village on the 27th July last, our Law Office, together with many other buildings, was destroyed—we had in our office one of Rich's Improved Patent Salamander Safes, which, though heated red hot, preserved, without being the least damaged, many papers valuable to our clients—the envelopes of a few papers being slightly scorched. Some twenty-four hours after the fire, the Safe was removed, and so hot was it, that several hours were required for it to cool off. Our office was in the second story of a large brick building, all the wood used in construction of said house being pitch pine. While the Safe was red hot, one of the walls tumbled in, and so injured the lock that it was necessary to break the door open. From this test, we feel no hesitancy in recommending "Rich's Patent Salamander Safe" as *entirely fire proof*.

GOREE & KING.

Marion, Ala., Sept. 15th, 1846.

*Still other Tests in the Great Fire of July 19, 1845.*

The undersigned purchased of A. S. Martin, No. 138½ Water street, one of Rich's Improved Patent Salamander Safes, which was in our store, No. 54 Exchange place. The store was entirely consumed in the great conflagration on the morning of the 19th inst. The safe was taken from the ruins 52 hours after, and on opening it, the books and papers were found entirely uninjured by fire, and only slightly wet—the leather on some of the books was perched by the extreme heat.

RICHARDS & CRONKHITE.

Benton, Miss., December 27, 1845.

One of Rich's Improved Salamander Safes, which I purchased on the 2d of June last of A. S. Marvin, 138½ Water street, agent for the manufacturer, was exposed to the most intense heat during the late dreadful conflagration. The store which I occupied, No. 46 Broad street, was entirely consumed; the safe fell from the 2d story, about 15 feet, into the cellar, and remained there 14 hours, and when found, I am told, and from its appearance afterwards, should judge that it had been heated to a red heat. On opening it, the books and papers were found not to have been touched by fire. I deem this ordeal sufficient to confirm fully the reputation that Rich's safe has already obtained for preserving its contents against all hazards.

(Signed,)

WM. BLOODGOOD.

New York, 21st July, 1845.

Reference made to upwards of nine hundred and fifty merchants, cashiers, brokers, and officers of courts and counties, who have Rich's Safe's in use.

The above safes are finished in the neatest manner, and can be made to order at short notice, of any size and pattern, and fitted to contain plate, jewelry, etc. Prices from \$50 to \$500 each. For sale by

A. S. MARVIN, General Agent,

138½ Water st., N. Y.

Also by Isaac Bridge 76 Magazine street, New Orleans.

Also by Lewis M Hatch, 120 Meeting street Charleston, S. C.

### FRENCH AND BAIRD'S PATENT SPARK ARRESTER.

TO THOSE INTERESTED IN Railroads, Railroad Directors and Managers are respectfully invited to examine an improved SPARK ARRESTER, recently patented by the undersigned.

Our improved Spark Arresters have been extensively used during the last year on both passenger and freight engines, and have been brought to such a state of perfection that no annoyance from sparks or dust from the chimney of engines on which they are used is experienced.

These Arresters are constructed on an entirely different principle from any heretofore offered to the public. The form is such that a rotary motion is imparted to the heated air, smoke and sparks passing through the chimney, and by the centrifugal force thus acquired by the sparks and dust they are separated from the smoke and steam, and thrown into an outer chamber of the chimney through openings near its top, from whence they fall by their own gravity to the bottom of this chamber; the smoke and steam passing off at the top of the chimney, through a capacious and unobstructed passage, thus arresting the sparks without impairing the power of the engine by diminishing the draught or activity of the fire in the furnace.

These chimneys and arresters are simple, durable and neat in appearance. They are now in use on the following roads, to the managers and other officers of which we are at liberty to refer those who may desire to purchase or obtain further information in regard to their merits:

R. L. Stevens, President Camden and Amboy Railroad Company; Richard Peters, Superintendent Georgia Railroad, Augusta, Ga.; G. A. Nicolls, Superintendent Philadelphia, Reading and Pottsville Railroad, Reading, Pa.; W. E. Morris, President Philadelphia, Germantown and Norristown Railroad Company, Philadelphia; E. B. Dudley, President W. and R. Railroad Company, Wilmington, N. C.; Col. James Gadsden, President S. C. and C. Railroad Company, Charleston, S. C.; W. C. Walker, Agent Vicksburgh and Jackson Railroad, Vicksburgh, Miss.; R. S. Van Rensselaer, Engineer and Sup't Hartford and New Haven Railroad; W. R. M'Kee, Sup't Lexington and Ohio Railroad, Lexington, Ky.; T. L. Smith, Sup't New Jersey Railroad Trans. Co.; J. Elliott, Sup't Motive Power Philadelphia and Wilmington Railroad, Wilmington, Del.; J. O. Sterns, Sup't Elizabethtown and Somerville Railroad; R. R. Cuyler, President Central Railroad Company, Savannah, Ga.; J. D. Gray, Sup't Macon Railroad, Macon, Ga.; J. H. Cleveland, Sup't Southern Railroad, Monroe, Mich.; M. F. Chittenden, Sup't M. P. Central Railroad, Detroit, Mich.; G. B. Fisk, President Long Island Railroad, Brooklyn.

Orders for these Chimneys and Arresters, addressed to the subscribers, care Messrs. Baldwin & Whitney, of this city or to Hinckly & Drury, Boston, will be promptly executed. FRENCH & BAIRD.

N. B.—The subscribers will dispose of single rights, or rights for one or more States, on reasonable terms.

Philadelphia, Pa., April 6, 1844.

•• The letters in the figures refer to the article given in the Journal of June, 1844.

ja45

**PATENT HAMMERED RAILROAD, SHIP and Boat Spikes.** The Albany Iron and Nail Works have always on hand, of their own manufacture, a large assortment of Railroad, Ship and Boat Spikes, from 2 to 12 inches in length, and of any form of head. From the excellence of the material always used in their manufacture, and their very general use for railroads and other purposes in this country, the manufacturers have no hesitation in warranting them fully equal to the best spikes in market, both as to quality and appearance. All orders addressed to the subscriber at the works, will be promptly executed. JOHN F. WINSLOW, Agent.

Albany Iron and Nail Works, Troy, N. Y. The above spikes may be had at factory prices, of Erastus Corning & Co., Albany; Hart & Merritt, New York; J. H. Whitney, do.; E. J. Etting, Philadelphia; Wm. E. Coffin & Co., Boston. ja45

**MACHINE WORKS OF ROGERS, Ketchum & Grosvenor, Patterson, N. J.** The undersigned receive orders for the following articles, manufactured by them of the most superior description in every particular. Their works being extensive and the number of hands employed being large, they are enabled to execute both large and small orders with promptness and despatch.

#### Railroad Work.

Locomotive steam engines and tenders; Driving and other locomotive wheels, axles, springs & flange tires; car wheels of cast iron, from a variety of patterns, and chills; car wheels of cast iron with wrought tires; axles of best American refined iron; springs; boxes and bolts for cars.

Cotton, Wool and Flax Machinery of all descriptions and of the most improved patterns, style and workmanship.

Mill gearing and Millwright work generally; hydraulic and other presses; press screws; callenders; lathes and tools of all kinds; iron and brass castings of all descriptions.

ROGERS, KETCHUM & GROSVENOR, ja45 Paterson, N. J., or 60 Wall street, N. York.

**PATENT RAILROAD, SHIP AND BOAT Spikes.** The Troy Iron and Nail Factory keeps constantly for sale a very extensive assortment of Wrought Spikes and Nails, from 3 to 10 inches, manufactured by the subscriber's Patent Machinery, which after five years' successful operation, and now almost universal use in the United States (as well as England, where the subscriber obtained a patent) are found superior to any ever offered in market.

Railroad companies may be supplied with Spikes having countersink heads suitable to holes in iron rails, to any amount and on short notice. Almost all the railroads now in progress in the United States are fastened with Spikes made at the above named factory—for which purpose they are found invaluable, as their adhesion is more than double any common spikes made by the hammer.

All orders directed to the Agent, Troy, N. York will be punctually attended to.

HENRY BURDEN, Agent.

Spikes are kept for sale, at Factory Prices, by I. & J. Townsend, Albany, and the principal iron merchants in Albany and Troy; J. I. Brower, 222 Water St., New York; A. M. Jones, Philadelphia; T. Janviers, Baltimore; Degrand & Smith, Boston.

•• Railroad Companies would do well to forward their orders as early as practicable, as the subscriber is desirous of extending the manufacturing so as to keep pace with the daily increasing demand.

ja45

**DAVENTPORT & BRIDGES CONTINUE** to Manufacture to Order, at their Works, in Cambridgeport, Mass., Passenger and Freight Cars of every description, and of the most improved pattern. They also furnish Snow Ploughs and Chilled Wheels of any pattern and size. Forged Axles, Springs, Boxes and Bolts for Cars at the lowest prices. All orders punctually executed and forwarded to any part of the country.

Our Works are within fifteen minutes ride from State street, Boston—coaches pass every fifteen minutes.

1y1

## THE HERRON RAILWAY TRACK,

As seen stripped of the top ballasting

A GOLD MEDAL AWARDED THE INVENTOR BY THE AMERICAN INSTITUTE.

**THE UNDERSIGNED RESPECTFULLY** invites the attention of Engineers, and Railroad Companies, to some highly important improvements he has recently made in the Herron system of Railway structure. These improvements enable him to effect a very large reduction in the quantity of Timber, and cost of construction, without impairing the strength of the Track, or its powers of resisting frost, while they secure additional features of excellence in the Drainage and facility of making Repairs.

The above cut represents the "Herron Track" as it is laid on the Philadelphia and Reading, and on the Baltimore and Susquehanna Railroads. The intersection of the sills of the trellis are 5 feet from centre to centre, while in the new construction they are only 2½ feet. This renders the string piece unnecessary, thus removing the only objectionable feature found in the Track.

The result of experience has proved that all Tracks constructed with longitudinal timbers, such as mud sills, and more especially, the continuous bearing string pieces retain the rain water that falls between the Rails, which, being thus confined, settles along those timbers, and accumulating in quantity flows rapidly along them on the descending grades, washing out the earth from under the timber, and frequently causing large breaches in the embankments of the road. Whereas all water intercepted by the oblique sills of the trellis, is discharged immediately into the side ditches.

In the 5 foot plan, the Track occupies a Road bed nearly 11 feet wide, while the new construction takes

but 8 feet; the timber being more concentrated under the Rails. A block of hard wood, about 2 feet long and 15 inches wide, is introduced into a square of the trellis for the purpose of giving an additional, and effectual support to the joints of the Rails, which rest upon it. Should these joint blocks become chafed and worn by the working, and imbedding of the chairs, as is now the case on all Railroads, they can be readily replaced without any derangement of the timbers less liable to wear.

The following is a general estimate of its cost near the seaboard. In the interior it will be considerably less.

ESTIMATE OF THE PROBABLE COST OF ONE MILE.		
4,224 Timbers, 11 ft. long, 3 x 6 inches =	68,696 ft. b.m., at \$10 =	\$686 96
587 Oak joint blocks 2 ft. x 3 x 15 in. =	4,403 ft. b.m., at \$13 =	57 24
13,000 Spikes = 2,250 lbs. at 4½ cts =		101 25
Workmanship free of patent charge =		600 00

Cost of one mile including the laying of the Rail.....\$1,445 45

He has made other important improvements, which will be shown in properly proportioned models, that give a much better idea of the great strength of the Track than a drawing will do.

Sales of the Patent right to all the distant States will be made on liberal terms.

JAMES HERRON.

Civil Engineer and Patentee.

No. 277 South Tenth St., Philadelphia. 33tf

**ENGLISH PATENT WIRE ROPES—FOR THE USE OF MINES, RAILWAYS, ETC.**—for sale or imported to order by the subscriber.

These Ropes are manufactured on an entirely different principle from any other, and are now almost exclusively used in the collieries and on the railways in Great Britain, where they are considered to be greatly superior to hempen ones, or iron chains, as regards safety, durability and economy. The plan upon which they are made effectually secures them from corrosion in the interior, as well as the exterior of the rope, and gives a greater compactness and elasticity than is found in any other manufacture.

Many of these ropes have been in constant operation in the different mines in England, and on the Blackwall and other inclined planes, for three and four years, and are still in good condition.

They have been applied to almost every purpose for which hempen ropes have been used—mines, heavy cranes, standing rigging, window cords, lightning conductors, signal halyards, tiller ropes, etc. Reference is made to the annexed statement for the relative strength and size. Testimonials from the most eminent engineers in England can be shown as to their efficiency, and any additional information required respecting the different descriptions and application will be given by

ALFRED L. KEMP,

75 Broad street, New York, sole agent in the United States.

*Statement of Trial made at the Woolwich Royal Dock Yard, of the Patent Wire Ropes, as compared with Hempen Ropes and Iron Chains of the same strength.—October, 1841.*

WIRE ROPES.			HEMPEN ROPES.			CHAINS.		STRENGTH
Wire gauge number.	Circumference of rope.	Weight per fathom.	Circumference of rope.	Weight per fathom.		Weight per fathom.	Diameter of iron.	
	INCH.	LBS. OZ.	INCH.	LBS. OZ.		LBS.	INCH.	Tons.
11	4½	13 5	10	24 -		50	15-16	20
13	3½	8 3	8½	16 -		27	11-16	13½
14	3½	6 11	7½	12 8		17	9-16	10½
15	2½	5 2	6½	9 4		13½	1-2	7½
16	2½	4 3	6	8 8		10½	7-16	7

N.B. The working load, with a perpendicular lift, may be taken at 6 cwt. for every lb. weight per fathom, so that a rope weighing 5 lbs. per fathom would safely lift 360 lbs., and so on in proportion. 1y24

**BOSTON AND PROVIDENCE RAILROAD.** Passenger Notice. Summer Arrangement. On and after Monday, Sept. 28, 1846, the Passenger Trains will run as follows:

For New York—Night Line, via Stonington. Leaves Boston every day, but Sunday, at 5 p.m. Accommodation Trains, leave Boston at 7½ a.m. and 3½ p.m., and Providence at 8 a.m. and 3½ p.m. Dedham trains, leave Boston at 9 a.m.; 3 p.m., 5½ p.m., and 10½ p.m. Leave Dedham at 8 a.m. and 4½ and 9 p.m.

Stoughton trains, leave Boston at 11½ a.m. and 4-10 p.m. Leave Stoughton at 8 a.m. and 2½ p.m. All baggage at the risk of the owners thereof.

31 ly W. RAYMOND LEE, Sup't.

**BRANCH RAILROAD AND STAGES CONNECTING** with the Boston and Providence Railroad. Stages connect with the Accommodation trains at the Foxboro' Station, to and from Woonsocket. At the Seekonk Station, to and from Lonsdale, R. I. via Pawtucket. At the Sharon Station, to and from Walpole, Mass. And at Dedham Village Station, to and from Medford, via Medway, Mass. At Providence, to and from Bristol, via Warren, R. I.—Taunton, New Bedford and Fall River cars run in connection with the accommodation trains.

## BOSTON AND MAINE RAILROAD.

Upper Route, Boston to Portland via, Reading, Andover, Haverhill, Exeter, Dover, Great Falls, South & North Berwick, Wells, Kennebunk and Saco.

Winter Arrangement, 1846-7.

On and after October 5th, 1846, Passenger Trains will leave daily, (Sundays excepted,) as follows:

Boston for Portland at 7½ a.m. and 2½ p.m.  
Boston for Great Falls at 7½ a.m., 2½ and 3-25 p.m.

Boston for Haverhill at 7½ and 11½ a.m., 2½, 3-25 and 5 p.m.

Boston for Reading at 7½, and 11½ a.m., 2½, 3-25 and 6½ p.m.

Portland for Boston at 7½ a.m., and 3 p.m.

Great Falls for Boston at 6½ and 9½ a.m., and 4½ p.m.

Haverhill for Boston at 7½, 8½, and 11 a.m. and 3 and 6½ p.m.

Reading for Boston at 7, 8½ and 9½ a.m., 12 m., 1½, 4 and 7½ p.m.

The Depot in Boston is on Haymarket Square.

Passengers are not allowed to carry Baggage above \$50 in value, and that personal Baggage, unless notice is given, and an extra amount paid, at the rate of the price of a Ticket for every \$500 additional value.

1y31 CHAS. MINOT, Super't.

## THE BEST RAILROAD ROUTE TO THE

Lake and Buffalo, from Cincinnati.

Take Cars to Xenia, 65

miles; take Stage to Mans-

field, 68 miles; thence by Cars to Sandusky, 56 miles to the Lake; thence Steamboat to Buffalo, 230 miles.

Fare from Cincinnati to Sandusky.....\$3 00

" " Sandusky to Buffalo, Cabin..... 6 00

" " " " Steerage..... 4 50

Fare by this route, although the cheapest across the state, will be reduced in a short time, railroad lengthened, and speed increased.

Leave Cincinnati in the morning, arrive at Columbus at night.

Leave Columbus in the morning, arrive at Sandusky same day.

Leave Sandusky, by Boat, in the morning, arrive at Buffalo next morning in time for the Cars north and east for Niagara Falls, Canada, Saratoga Springs, Troy, Albany, Boston, New York, Washington, or Philadelphia.

Passengers should not omit to pay their fare through from Cincinnati to Sandusky, or from Columbus to Sandusky via Mansfield; as this route is the only one that secures 56 miles [this road is run over in 2h. 50m.] most railroad which is new, and is the shortest, cheapest and most expeditious across the state.

Fares on the New York railroads are about to be reduced.

Sandusky, Ohio. B. HIGGINS, Sup't, etc. M. & S. C. R. R. Co.

## SUMMER ARRANGEMENT.—NEW YORK

AND ERIE RAILROAD LINE, from April 1st until further notice, will

run daily (Sundays excepted) between the city of New York and Middletown, Goshen, and intermediate places, as follows:

FOR PASSENGERS—

Leave New York at 7 A. M. and 4 P. M.

" Middletown at 6½ A. M. and 5½ P. M.

FARE REDUCED TO \$1 25 to Middletown—way in proportion. Breakfast, supper and berths can be had on the steamboat.

FOR FREIGHT—

Leave New York at 5 P. M.

" Middletown at 12 M.

The names of the consignee and of the station where to be left, must be distinctly marked upon each article shipped. Freight not received after 5 P. M. in New York.

Apply to J. F. Clarkson, agent, at office corner of Duane and West sts. H. C. SEYMOUR, Sup't. March 25th, 1846.

Stages run daily from Middletown, on the arrival of the afternoon train, to Milford, Carbondale, Honesdale, Montrose, Towanda, Owego, and West; also to Monticello, Windsor, Binghamton, Ithaca, etc., etc. Agent on board. 13 tr

## NORWICH AND WORCESTER RAIL-

Road. Summer Arrangement, commencing

Monday, April 6, 1846.

Accommodation Trains, daily,

except Sunday. Leave Norwich, at 6 a.m., and 4½ p.m. Leave Worcester, at 10 a.m., and 4½ p.m.

The morning Accommodation Trains from Norwich, and from Worcester, connect with the trains of the Boston, and Worcester and Western railroads each way.

The Evening Accommodation Train from Worcester connects with the 1½ p.m. train from Boston.

New York Train via Long Island Railroad:

Leave Allyn's Point for Boston, about 1 p.m., daily, except Sunday.

Leave Worcester for New York, about 10 a.m., stopping at Webster, Danielsonville, and Norwich.

New York Train via Steamboat—Leave Norwich for Boston, every morning, except Monday, on the arrival of the steamboat from New York, stopping at Norwich and Danielsonville.

Leave Worcester for New York, upon the arrival of the train from Boston, at about 4½ p.m., daily, except Sunday, stopping at Webster, Danielsonville and Norwich.

Freight Trains daily each way, except Sunday.—Special contracts will be made for cargoes, or large quantities of freight, on application to the superintendent.

Fares are Less when paid for Tickets than when paid in the Cars. 32 ly

J. W. STOWELL, Sup't.

# TROY RAILROADS.—IMPORTANT NOTICE.—Troy and Greenbush Railroad, forming a continuous track from Boston

to Buffalo and Saratoga Springs. This road is new, and laid with the heaviest iron H rail. Trains will always be run on this road connecting at Greenbush each way with the trains to and from Boston and intermediate places, leaving Greenbush daily at 1 1/2 p.m. and 6 p.m., or on arrival of the trains from Boston; leave Troy at 7 1/2 a.m. and 4 1/2 p.m., or to connect with trains to Boston.

Trains also run hourly on this road between Troy and Albany. Running time between Greenbush and Troy, 15 minutes.

## TROY AND SCHENECTADY RAILROAD.

This road is laid its entire length with the heaviest H rail, which is not the fact with the road from Albany. Trains will always be run on this road connecting each way, to and from Buffalo and intermediate places. Leave Troy for Buffalo at 7 1/2 a.m. and 1 p.m. and 6 1/2 p.m., or to connect with the trains for the west; leave Schenectady at 2 1/2 a.m., 8 1/2 a.m., 1 p.m. and 3 1/2 p.m., or on arrival of the trains from Buffalo and intermediate places.

## TROY AND SARATOGA RAILROAD.

### THE ONLY DIRECT ROUTE.

No change of passenger, baggage or other cars on this route. Cars leave Troy for Ballston, Saratoga Springs, Lake George and White Hall at 7 1/2 a.m., (arriving one hour in advance of the train from Albany,) and at 3 1/2 p.m. Returning, leave Saratoga at 9 a.m. and 3 1/2 p.m., (reaching Troy in time for the evening boats to New York.) Cars also leave Troy for the Burrough at 3 1/2 p.m. and 7 p.m., connecting with packet boats for the north. This takes passengers from New York and Boston to Montreal in 44 hours.

N.B. Travellers will find the routes through Troy most convenient and economical, and as expeditious as any other. The steamboats to and from New York land within a few steps of the railroad office, and passengers are taken up and landed by the different railroad lines at the doors of principal hotels, thus saving all necessity for, and annoyance from, hack drivers, cabmen, runners, etc.

Aug 3, 1846.

1y 32

## BALTIMORE AND OHIO RAILROAD.

**MAIN STEM.** The Train carrying the Great Western Mail leaves Baltimore every morning at 7 1/2 and Cumberland at 8 o'clock, passing Ellicott's Mills, Frederick, Harpers Ferry, Martinsburgh and Hancock, connecting daily each way with the Washington Trains at the Relay House seven miles from Baltimore, with the Winchester Trains at Harpers Ferry—with the various railroad and steamboat lines between Baltimore and Philadelphia and with the lines of Post Coaches between Cumberland and Wheeling and the fine Steamboats on the Monongahela Slack Water between Brownsville and Pittsburgh. Time of arrival at both Cumberland and Baltimore 5 1/2 P. M. Fare between those points \$7, and 4 cents per mile for less distances. Fare through to Wheeling \$11 and time about 36 hours, to Pittsburgh \$10, and time about 32 hours. Through tickets from Philadelphia to Wheeling \$13, to Pittsburgh \$12. Extra train daily except Sundays from Baltimore to Frederick at 4 P. M., and from Frederick to Baltimore at 8 A. M.

### WASHINGTON BRANCH.

Daily trains at 9 A. M. and 5 P. M. and 12 at night from Baltimore and at 6 A. M. and 5 P. M. from Washington, connecting daily with the lines North, South and West, at Baltimore, Washington and the Relay house. Fare \$1.60 through between Baltimore and Washington, in either direction, 4 cents per mile for intermediate distances.

**THE SUBSCRIBER IS PREPARED TO** execute at the Trenton Iron Works, orders for Railroad Iron of any required pattern, and warranted equal in every respect in point of quality to the best American or imported Rails. Also on hand and made to order, Bar Iron, Braziers' and Wire Rods, etc., etc.

PETER COOPER 17 Burling Slip.

New York.

## NEW RAILROAD ROUTE FROM BUFFALO TO CINCINNATI.

Passengers destined for Columbus and Cincinnati, Louisville, Ky., St. Louis, Mo., Memphis, Tenn., Vicksburg, Natchez, New Orleans, and all intermediate ports, will find a new, and the most expeditious and comfortable Route, by taking Steamboats at Buffalo, landing at Sandusky City, Ohio, distance 230 miles.

From thence by Cars, over the Mansfield Railroad which is new and just opened [laid with heavy iron,] to Mansfield, distance 56 " Thence by Stage via Columbus to Xenia over gravel and Macadamized Road, (the best in the state,) in new coaches, distance 88 " Thence, over the Little Miami Railroad, from Xenia to Cincinnati, distance 65 "

### TIME.

From Buffalo to Sandusky 24 hours. Leave Sandusky 5 a.m. to Columbus 14 " From Columbus to Cincinnati 15 " Or say 30 hours from Sandusky to Cincinnati over this route, including delays.

### FARE.

From Buffalo to Sandusky, Cabin 96 00 " " " Steerage 3 00 " Sandusky to Columbus 4 50 " " through to Cincinnati 8 00

Passengers should not omit to pay their fare through from Sandusky City to Cincinnati and take receipts availing themselves of the benefit of a contract existing between the said Railroad and Stage Co's, securing 121 miles travel by good Railroad and 88 miles by Stage, in crossing from Lake Erie to the Ohio river, in the space of 30 hours.

Passengers destined for St. Louis, or any point below on the Mississippi, will save by taking this route, from 4 to 6 days time and travel, and nearly half the expense, over the Chicago and Peoria route to the above places.

Fare by this route, although the cheapest, will in a short time be reduced, Railroad lengthened, and speed increased.

B. HIGGINS, Sup't, etc.

M. & S. C. R. R. Co.

Sandusky City, Ohio.

## NEW YORK & HARLEM RAILROAD CO.—Winter Arrangement.

On and after Monday, November 23, 1846, the cars will run as follows:

Leave 27th street for 42d street, Deaf and Dumb Institute, Yorkville, Harlem Morrisania, and Williams' Bridge, at 7 o'clock a.m. From City Hall for above named places, 2 p.m. [freight train,] 2 30 p.m. 5 p.m. to Morrisania only.

Leave City Hall for Harlem, Morrisania, Fordham and Williams' Bridge, at 7 45 a.m., and 10 45 a.m.; 1 15 p.m., 2 p.m. [freight train,] 2 30 p.m. and 3 45 p.m.

Leave City Hall for Hunt's Bridge, Bronx, Tuckahoe, Hart's Corners White Plains, Davis' Brook, Unionville and Pleasantville, [Pleasantville 4 miles from Sing Sing,] 7 45 and 10 45 a.m.; 1 15 p.m., 2 p.m. [freight train,] and 3 45 p.m.

### RETURNING.

Leave Pleasantville, at 8, 10, [freight train,] and 11 a.m.; 1 30, and 4 p.m.

Leave White Plains, at 8 12, 10 30, [freight train] and 11 20 a.m.; 1 50, and 4 20 p.m.

Leave Tuckahoe, 8 35, 10 55, [freight train,] and 11 35 a.m.; 2 05, and 4 35 p.m.

Leave Williams' Bridge at 7 45, 8 50 and 11 50 a.m.; 2 10, 4, and 4 50 p.m.

Leave Morrisania 8 and 9 05 a.m.; 12 05, 2 35, 4 20, 5 05 and 6 p.m.

Leave Yorkville, at 8 12 a.m.; 4 35 and 6 15 p.m.

### SUNDAY ARRANGEMENTS.

Leave City Hall for Pleasantville and intermediate places, at 7 45 a.m.; 1 15 and 3 p.m.

Leave Pleasantville for City Hall, at 8 a.m.; 11, and 3 15 p.m.

Leave City Hall for Williams' Bridge and intermediate places, 10 45 a.m.; 2 30 p.m.

Leave Williams' Bridge for City Hall, at 8 50 and 11 50 a.m.; 1, 3 45 and 4 05 p.m.

## BALTIMORE AND SUSQUEHANNA RAILROAD.—Reduction of Fare. Morning and Afternoon Trains between Baltimore and York.—The Passenger

trains run daily, except Sunday, as follows: Leaves Baltimore at 9 a.m. and 3 1/2 p.m. Arrives at 5 a.m. and 6 1/2 p.m. Leaves York at 5 a.m. and 3 p.m. Arrives at 12 1/2 p.m. and 8 p.m. Leaves York for Columbia at 1 1/2 p.m. and 8 a.m. Leaves Columbia for York at 6 a.m. and 2 p.m.

### FARE.

Fare to York 1 50 " Wrightsville 2 00 " Columbia 3 12 1/2

Way points in proportion.

## PITTSBURG, GETTYSBURG AND HARRISBURG.

Through tickets to Pittsburg via stage to Harrisburg 39 Or via Lancaster by railroad 10 Through tickets to Harrisburg or Gettysburg 3 In connection with the afternoon train at 3 o'clock, a horse car is run to Green Spring and Owings' Mill, arriving at the Mills at 5 1/2 p.m. Returning, leaves Owings' Mills at 7 a.m.

D. C. H. BORDLEY, Sup't.

31 ly Ticket Office, 63 North st.

## LEXINGTON AND OHIO RAILROAD.

Trains leave Lexington for Frankfort daily, at 5 o'clock a.m., and 2 p.m. Trains leave Frankfort for Lexington daily, at 8 o'clock a.m. and 2 p.m. Distance, 28 miles. Fare \$1-25.

On Sunday but one train, 5 o'clock a.m. from Lexington, and 2 o'clock p.m. from Frankfort.

The winter arrangement (after 15th September to 15th March) is 6 o'clock a.m. from Lexington, and ma. 9. from Frankfort, other hours as above.

351y

## SOUTH CAROLINA RAILROAD.—A Passenger Train runs daily from Charleston,

on the arrival of the boats from Wilmington, N. C., in connection with trains on the Georgia, and Western and Atlantic Railroads—and by stage lines and steamers connects with the Montgomery and West Point, and the Tusculum Railroad in N. Alabama. Fare through from Charleston to Montgomery daily 26 50 Fare through from Charleston to Huntsville, Decatur and Tusculum 22 00

The South Carolina Railroad Co. engage to receive merchandise consigned to their order, and to forward the same to any point on their road; and to the different stations on the Georgia and Western and Atlantic railroad; and to Montgomery, Ala., by the West Point and Montgomery Railroad.

1y25 JOHN KING, Jr, Agent.

## CENTRAL RAILROAD—FROM SAVANNAH TO MACON. Distance 190 miles.

This Road is open for the transportation of Passengers and Freight. Rates of Passage, \$8 00. Freight—On weight goods generally... 50 cts. per hundred. On measurement goods... 13 cts. per cubic ft. On brls. wet (except molasses and oil)... \$1 50 per barrel. On brls. dry (except lime)... 80 cts. per barrel. On iron in pigs or bars, castings for mills, and unboxed machinery... 40 cts. per hundred. On hhds. and pipes of liquor, not over 120 gallons... \$5 00 per hhd. On molasses and oil... \$6 00 per hhd. Goods addressed to F. WINTER, Agent, forwarded free of commission. THOMAS PURSE, y40 Gen'l. Sup't, Transportation.

## MANUFACTURE OF PATENT WIRE

Rope and Cables for Inclined Planes, Standing Ship Rigging, Mines, Cranes, Tillers etc., by JOHN A. ROEBLING, Civil Engineer, Pittsburg, Pa.

These Ropes are in successful operation on the planes of the Portage Railroad in Pennsylvania, on the Public Slips, on Ferries and in Mines. The first rope put upon Plane No. 3, Portage Railroad, has now run 4 seasons, and is still in good condition.

2v19 1y

**CENTRAL AND MACON AND WESTERN** Railroads, Ga.—These Roads with the Western and Atlantic Railroad of the State of Georgia, form a continuous line from Savannah to Oothcaloga, Ga., of 371 miles, viz:

Savannah to Macon—Central Railroad ..... 190  
Macon to Atlanta—Macon and Western ..... 101  
Atlanta to Oothcaloga—Western and Atlantic... 80

Goods will be carried from Savannah to Atlanta and Oothcaloga, at the following rates, viz:

	To Atlanta.	To Oothcaloga.
On Weight Goods—Sugar, Coffee, Liquor, Bagging, Rope, Butter, Cheese, Tobacco, Leather, Hides, Cotton Yarns, Copper, Tin, Bar & Sheet Iron, Hollow Ware & Castings.....	\$0 50	\$0 75

On Measurement Goods—Boxes of Hats, Bonnets and Furniture, per cubic foot.....	0 20	0 26
Boxes and Bales of Dry Goods, Saddlery, Glass, Paints, Drugs and Confectionary, per cubic foot.....	0 20 pr. 100 lbs. 35	
Crockery, per cubic foot.....	0 15 " " 35	
Molasses and Oil, per hhd., (smaller casks in proportion). 9 00		12 50
Ploughs, (large,) Cultivators, Corn Shellers, and Straw Cutters, each.....	1 25	1 50
Ploughs, (small,) and Wheelbarrows.....	0 80	1 05
Salt, per Liverpool Sack.....	0 70	0 95
Passage—Savannah to Atlanta, \$10; Children, under 12 years of age, half price, Savannah to Macon, \$7.		

Goods consigned to the subscriber will be forwarded free of Commissions.

Freight may be paid at Savannah, Atlanta or Oothcaloga.

F. WINTER, Forwarding Agent, C. R. R.  
Savannah, Aug. 15th, 1846. 1y34

**GREAT SOUTHERN MAIL LINE! VIA** Washington city, Richmond, Petersburg, Weldon and Charleston, S. C., direct to New Orleans. The only Line which carries the Great Southern Mail, and Twenty-four Hours in advance of Bay Line, leaving Baltimore same day.

Passengers leaving New York at 4½ P.M., Philadelphia at 10 P.M., and Baltimore at 6½ A.M., proceed without delay at any point, by this line, reaching Richmond in eleven, Petersburg in thirteen and a half hours, and Charleston, S. C., in two days from Baltimore.

Fare from Baltimore to Charleston.....\$21 00  
" " " Richmond..... 6 60

For Tickets, or further information, apply at the Southern Ticket Office, adjoining the Washington Railroad Office, Pratt street, Baltimore, to  
STOCTON & FALLS, Agents.

**RAILROAD SCALES.—THE ATTENTION** of Railroad Companies is particularly requested to Ellicott's Scales, made for weighing loaded cars in trains, or singly, they have been the inventors, and the first to make platform scales in the United States; supposing that an experience of 20 years has given a knowledge and superior advantage in the business.

The levers of our scales are made of wrought iron, all the bearers and fulcrums are made of the best cast steel, laid on blocks of granite, extending across the pit, the upper part of the scale only being made of wood. E. Ellicott has made the largest Railroad Scale in the world, its extreme length was one hundred and twenty feet, capable of weighing ten loaded cars at a single draft. It was put on the Mine Hill and Schuylkill Haven Railroad.

We are prepared to make scales of any size to weigh from five pounds to two hundred tons.

ELLIOTT & ABOTT.  
Factory, 9th street, near Coates, cor. Melon st.  
Office, No. 3 North 5th street,  
1y25 Philadelphia, Pa.

**GEORGIA RAILROAD. FROM AUGUSTA TO ATLANTA—171 MILES.**

AND WESTERN AND ATLANTIC RAILROAD FROM ATLANTA TO OOTHCALOGA, 80 MILES.

This Road in connection with the South Carolina Railroad and Western and Atlantic Railroad now forms a continuous line, 388 miles in length, from Charleston to Oothcaloga on the Oostenaula River, in Cass Co., Georgia.

#### RATES OF FREIGHT.

	Between Augusta and Oothcaloga, 250 miles.	Between Charleston and Oothcaloga, 388 miles.
1st class. Boxes of Hats, Bonnets, and Furniture, per cubic foot.....	\$0 16	\$0 25
2d class. Boxes and Bales of Dry Goods, Saddlery, Glass, Paints, Drugs and Confectionary, per 100 lbs.	0 90	1 40

Salt per bushel.....	0 17	95
Salt per Liverpool sack.....		
Ploughs, Corn Shellers, Cultivators, Straw Cutters, Wheelbarrows.....	0 75	1 37

German or other emigrants, in lots of 20 or more, will be carried over the above roads at 2 cents per mile.

Goods consigned to S. C. Railroad Co. will be forwarded free of commissions. Freight may be paid at Augusta, Atlanta, or Oothcaloga.

J. EDGAR THOMSON,  
Ch. Eng. and Gen. Agent.  
Augusta, Sept. 2d, 1846. 44 1y

**THE WESTERN AND ATLANTIC** Railroad.—This Road is now in operation to Oothcaloga, a distance of 80 miles, and connects daily (Sundays excepted) with the Georgia Railroad.

From Kingston, on this road, there is a tri-weekly line of stages, which leave on the arrival of the cars on Tuesday, Thursday and Saturday, for Warrenton, Huntsville, Decatur and Tusculumbia, Alabama, and Memphis, Tennessee.

On the same days, the stages leave Oothcaloga for Chattanooga, Jasper, Murfreesborough, Knoxville and Nashville, Tennessee.

This is the most expeditious route from the east to any of these places.

CHAS. F. M. GARNETT,  
Chief Engineer.  
Atlanta, Georgia, April 16th, 1846. 1y1

**TO RAILROAD COMPANIES AND MANUFACTURERS** of railroad Machinery. The subscribers have for sale Am. and English bar iron, of all sizes; English blister, cast, shear and spring steel; Juniata rods; car axles, made of double refined iron; sheet and boiler iron, cut to pattern; tiers for locomotive engines, and other railroad carriage wheels, made from common and double refined B. O. iron; the latter a very superior article. The tires are made by Messrs. Hallwin & Whitney, locomotive engine manufacturers of this city. Orders addressed to them, or to us, will be promptly executed.

When the exact diameter of the wheel is stated in the order, a fit to those wheels is guaranteed, saving to the purchaser the expense of turning them out inside.

THOMAS & EDMUND GEORGE,  
E. cor. 12th and Market sts., Phila., Pa. a45

**LITTLE MIAMI RAILROAD.—OPEN** TO SPRINGFIELD—Distance 84 miles—

connecting at Xenia and Springfield with Messrs. Neil, Moore, & Co's. daily daylight lines of stages going east and north, to Columbus, Zanesville, Wheeling, Cleveland, and Sandusky City via Urbana, Bellefontaine, Kenton, and the Mad river and Lake Erie railroad, or Columbus, Delaware, and the Mansfield and Sandusky City railroad—forming, by these connections, the cheapest and most expeditious route to Buffalo, Niagara Falls, Rochester, Albany, New York, and Boston.

On and after Thursday, August 13, 1846, until further notice, a Passenger train will run as follows:

Leave Cincinnati daily at 9 A. M., for Millford, Foster's Crossing, Deerfield, Morrow, Fort Ancient, Freeport, Waynesville, Spring Valley, Xenia, Old Town, Yellow Springs, and Springfield.

Returning, will leave Springfield at 4 hours 35 minutes A. M. A line of Hacks runs in connection with the Cars, between Deerfield and Lebanon.

FARE—From Cincinnati to Lebanon.....\$1 00  
" " " Xenia..... 1 50  
" " " Springfield.. 2 00  
" " " Columbus... 4 00  
" " " Sandusky city 8 00

The Passenger trains runs in connection with Strader & Gorman's line of Mail Packets to Louisville.

Tickets can be procured at the Broadway Hotel, Dennison House, or at the Depot of the Company, on East Front street.

Further information and through tickets for the Stage lines, may be procured at P. Campbell, Agent on Front street, near Broadway.

The company will not be responsible for baggage beyond 50 dollars in value, unless the same is returned to the conductor or agent, and freight paid at of a passage for every \$500 in value over that amount.

The 1½ P. M. train from Cincinnati, and the 2 40 P. M. train from Xenia, will be discontinued on and after Monday, the 10th instant.

A freight train will run daily.  
47½ W. H. CLEMENT, Sup't.

**LAWRENCE'S ROSENDALE HYDRAULIC** Cement. This cement is warranted equal to any manufactured in this country, and has been pronounced superior to Francis' "Roman." Its value for Aqueducts, Locks, Bridges, Floods and all Masonry exposed to dampness, is well known, as it sets immediately under water, and increases in solidity for years.

For sale in lots to suit purchasers, in tight paper-barrels, by JOHN W. LAWRENCE,  
142 Front street, New York.

Orders for the above will be received and promptly attended to at this office. 32 1y

**CLEVELAND, COLUMBUS AND CINCINNATI** Railroad. In pursuance of a resolution adopted by the Board of Directors, on the 21st October, notice is hereby given, that proposals will be received up to the 1st day of December next, for the Grading, Timbering, Bridges and Culverts on forty miles of the road, commencing at Cleveland. Profiles, Specifications, Terms of Payment, and all other information pertaining to the matter, to be furnished on application at the office of the Company, Merwin Block, Cleveland.

JOHN W. ALLEN, President.  
A. G. LAWRENCE, Secretary.  
CYRUS WILLIAMS, Engineer.  
Cleveland, October 23, 1846. 45 1m

**BACK VOLUMES OF THE RAILROAD JOURNAL** for sale at the office, No. 105 Chestnut street.

**A. & G. RALSTON & CO., NO. 4** South Front St., Philadelphia, Pa.

Have now on hand, for sale, Railroad Iron, viz: 180 tons 2½ x ½ inch Flat Punched Rails, 20 ft. long.  
25 " 2½ x ½ " Flange Iron Rails.  
75 " 1 x ½ " Flat Punched Bars for Drafts in Mines. A full assortment of Railroad Spikes, Boat and Ship Spikes. They are prepared to execute orders for every description of Railroad Iron and Fixtures. 11f

**VALUABLE PROPERTY ON THE MILL Dam For Sale.** A lot of land on Gravelly Point, so called, on the Mill Dam, in Roxbury, fronting on and east of Parker street, containing 68,497 square feet, with the following buildings thereon standing.

Main brick building, 120 feet long, by 46 ft wide, two stories high. A machine shop, 47x43 feet, with large engine, face, screw, and other lathes, suitable to do any kind of work.

Pattern shop, 35x32 ft, with lathes, work benches,

Work shop, 86x35 feet, on the same floor with the pattern shop.

Forge shop, 118 feet long by 44 feet wide on the ground floor, with two large water wheels, each 16 feet long, 9 ft diameter, with all the gearing, shafts, drums, pulleys, &c., large and small trip hammers, furnaces, forges, rolling mill, with large balance wheel and a large blowing apparatus for the foundry.

Foundry, at end of main brick building, 60x45 feet two stories high, with a shed part 45x20 feet, containing a large air furnace, cupola, crane and corn oven.

Store house—a range of buildings for storage, etc., 200 feet long by 20 wide.

Locomotive shop, adjoining main building, fronting on Parker street, 54x25 feet.

Also—A lot of land on the canal, west side of Parker st., containing 6000 feet, with the following buildings thereon standing:

Boiler house 50 feet long by 30 feet wide, two stories.

Blacksmith shop, 49 feet long by 20 feet wide.

For terms, apply to HENRY ANDREWS, 48 State st., or to CURTIS, LEAVENS & CO., 106 State st., Boston, or to A. & G. RALSTON & Co., Philadelphia.

**TO RAILROAD COMPANIES AND BUILDERS OF MARINE AND LOCOMOTIVE ENGINES AND BOILERS.**

#### PASCAL IRON WORKS.

##### WELDED WROUGHT IRON TUBES

From 4 inches to 4 in calibre and 2 to 12 feet long, capable of sustaining pressure from 400 to 2500 lbs. per square inch, with Stop Cocks, T, L, and other fixtures to suit, fitting together, with screw joints, suitable for STEAM, WATER, GAS, and for LOCOMOTIVE and other STEAM BOILER FLUES.

Manufactured and for sale by  
**MORRIS, TASKER & MORRIS.**  
Warehouse S. E. Corner of Third & Walnut Streets,  
**PHILADELPHIA.**

**PATENT INDESTRUCTIBLE WATER Pipes.** The subscribers continue to manufacture the above Pipes, of all the sizes and strength required for City or Country use, and would invite individuals or companies to examine its merits.—This pipe, unlike cast iron and lead, imparts neither color, oxide or taste, being formed of strongly riveted sheet iron, and evenly lined on the inside with hydraulic cement. While in the process of laying, it has a thick covering externally of the same—thus forming nature's own conduit of stone. The iron being thoroughly enclosed on both sides with cement, precludes the possibility of rust or decay, and renders the pipe truly indestructible. The prices are less than those of iron or lead. We also manufacture Basins and D. Traps, for Water Closets, on a new principle, which we wish the public to examine at 112 Fulton street, New York.

284 J. BALL & CO.

**LOCOMOTIVE AND MARINE ENGINE Boiler Builders.** Pascal Iron Works, Philadelphia. Welded Wrought Iron Flues, suitable for Locomotives, Marine and other Steam Engine Boilers, from 2 to 5 inches in diameter. Also, Pipes for Gas, Steam and other purposes; extra strong Tube for Hydraulic Presses; Hollow Pistons for Pumps of Steam Engines, etc. Manufacture and for sale by

**MORRIS TASKER & MORRIS,**  
Warehouse S. E. corner 3d and Walnut Sts., Philadelphia.

## NORRIS' LOCOMOTIVE WORKS.

BUSH HILL, PHILADELPHIA, Pennsylvania.

**MANUFACTURE** their Patent 6 Wheel Combined and 8 Wheel Locomotives of the following descriptions, viz:

Class	1,	15 inches Diameter of Cylinder,	× 20 inches Stroke.
"	2,	14	" " " × 24 " "
"	3,	14½	" " " × 20 " "
"	4,	12½	" " " × 20 " "
"	5,	11½	" " " × 20 " "
"	6,	10½	" " " × 18 " "

With Wheels of any dimensions, with their Patent Arrangement for Variable Expansion. Castings of all kinds made to order: and they call attention to their Chilled Wheels, for the Trucks of Locomotives, Tenders and Cars.

**NORRIS, BROTHERS.**

**THE NEWCASTLE MANUFACTURING** Company continue to furnish at the Works, situated in the town of Newcastle, Del., Locomotive and other steam engines, Jack screws, Wrought iron work and Brass and Iron castings, of all kinds connected with Steamboats, Railroads, etc.; Mill Gearing of every description; Cast wheels (chilled) of any pattern and size, with Axles fitted, also with wrought tires, Springs, Boxes and bolts for Cars; Driving and other wheels for Locomotives.

The works being on an extensive scale, all orders will be executed with promptness and despatch. Communications addressed to Mr. William H. Dobbs, Superintendent, will meet with immediate attention. **ANDREW C. GRAY,** President of the Newcastle Manuf. Co.

**RAILROAD IRON AND LOCOMOTIVE** Tires imported to order and constantly on hand by **A. & G. RALSTON**  
Mar. 20th 4 South Front St., Philadelphia.

**KEARNEY FIRE BRICK. F. W. BRINLEY,** Manufacturer, Perth Amboy, N. J. Guaranteed equal to any, either domestic or foreign; Any shape or size made to order. Terms, 4 mos. from delivery of brick on board. Refer to

## "Railways at Home and Abroad."

THE EDINBURGH REVIEW, AND ITS ARTICLE ON RAILWAYS. (ART. VII.)

(Continued from page 8.)

The line from Amsterdam to the frontier of Prussia is completed, and open as far as Arnheim, a distance of fifty-eight miles. This was constructed by the state, but afterwards leased to an Anglo Dutch Company. The capital invested being £800,000, the cost is £15,000 per mile. Privileges have been granted to companies for the construction of various other lines.

In a late session of the Second Chamber of the States-General, the minister of the Interior announced the approaching execution, through the instrumentality of private companies, of a complete system of railways; surveyed and laid out under the immediate superintendence of the government—the total capital to be invested in which would amount to from six to seven millions sterling.

Passing over the Italian States and Portugal, where little has yet been done in railway undertakings, we shall only add, as to Spain, that if behind other European powers in the improvement of inland transport at home, she has not been so supine in her colonies. A railway, forty-five miles in length, was constructed across the most fertile part of the beautiful island of Cuba, so early as 1838, and has since been in constant use. It is difficult to convey any adequate impression of the effects, produced on the mind of the traveller as he is carried over this natural garden, in a way so little to be expected, amid such scenery. Emerging from the tacon suburbs of the Havanna, he traverses fields of pine-apples, bordered by hedgerows bending under the burden of the ripe orange, and sprinkled at intervals with the banana, the plantain, and the cocoa-tree. These are alternated with sugar plantations and tobacco. Through this scene, redolent of the Tropics, and calling up the historic recollections of Columbus and his adventurous companions, he is whirled at the rate of twenty miles an hour, by machines bearing the name of a Manchester manufacturer, impelled by fuel from Lancashire, and worked by an engineer from Newcastle-on-Tyne! The swarthy African, as the strange apparition passes him, pauses from his toil, and gazes at it with a wonder which time and custom can hardly abate.

The advantages which railway transit presents on the score of expedition, economy and certainty, have, in the estimation of a considerable portion of the public, not only in England but elsewhere, been regarded as subject to a serious drawback and qualification, in consequence of the terrible character of the accidents which have from time to time, occurred. The circumstantial details of cases, circulated in highly-colored accounts by the daily press, are certainly calculated to raise much apprehension. We shall now, therefore, lay before the public such data of a well-ascertained nature, as may enable every one endowed with common sense and reflection, to decide on the

actual nature and degree of danger to which he exposes his person when he makes a journey by railway conveyance.

By the official reports of the Belgian Railways we find that 6,609,215 passengers travelled on these lines between 1835 and 1839. Of this number fifteen were killed and sixteen wounded by railway accidents. But of these numbers twenty six were persons employed on the road or in working the trains. Only three passengers were killed and two wounded. The chances of the death of a passenger from railway accident were therefore 1 to 2,203,215. In 1842, the number of passengers was 2,716,755. Of these three only were killed, one of whom was a suicide, and the other two met their deaths by crossing the line.

On the French lines, the deaths from accident have been still more rare. According to an official return for the first six months of 1843, upon the six lines which issued from the capital, of which the total length was 212 miles, the circulation had amounted to 18,446 trains, which transported 1,889,718 passengers. The distance travelled over was 316,945 miles. No traveller was either killed or wounded. Only three agents of the railway suffered.

It may not be uninteresting to put in juxtaposition with this, the returns of accidents produced by ordinary horse-coaches, travelling in Paris and its environs:

Year.	Killed.	Wounded.
1834	4	134
1835	12	214
1836	5	220
1837	11	361
1838	19	366
1839	9	364
1840	14	394
Total,	74	2073

On the English railways, of which the extent and traffic are much greater, the absolute number of accidents fatal or injurious must of course be expected to be more numerous. But we shall find, by referring to the Parliamentary returns, that the actual amount of danger to life or limb, on English railways, is quite insignificant. We take the following Statement from the last return of the Railway Department to Parliament:

Years.	Number of accidents.	Number of persons injured.		
		Killed.	Injured not Fatally.	Total.
1840.	28	22	131	153
(five months)				
1841	29	24	72	79
1842	10	5	14	14
1843	6	3	3	4
1844	34	10	74	74
1845	15	2	30	30

Years.	No. of miles of Railway open.	Proportion of the No. of persons injured to the total number carried.	
		Total No. of persons injured.	Total No. of persons carried.
1840	1330	6,029,866	1 in 39,410
(five months)			
1841	1556	20,449,745	1 in 213,018
1842	1717	21,358,445	1 in 1,124,128
1843	1798	25,573,525	1 in 4,262,087
1844	1912	30,363,052	1 in 356,702
1845	2118	16,720,550	1 in 522,517

It appears, therefore, that the chance in favor of the safety of travellers who con-

duct themselves with ordinary prudence, is half a million to one.

It may perhaps be asked, what is the kind or degree of prudence or caution expected from railway travellers, as more especially necessary to their security. We answer, as the result of rather large experience of railway travelling in nearly every part of the globe, that the best general rule is to keep your place in the carriage, if possible, to the end of your journey; never getting out and in at stations, except when indispensably necessary.

Among the numerous questions which have arisen out of the conflicting interests engaged in railway speculations in England, there is one which demands some notice, were it only on account of the extraordinary extent to which it has lately engrossed public attention. Nothing can more strikingly demonstrate the profound and general interest felt in everything connected with railways than the bitterness which has marked the contest, in which dispassionate and disinterested parties would find it difficult to discover any ground for a reasonable doubt as to the proper decision to be come to.

We have seen that there was in operation, at the close of last year, about 2100 miles of railway. In the construction of 1860 miles of these, the space between the rails was fixed, in accordance with that adopted in the earlier lines, at 56½ inches; an uniformity rendered necessary in order to enable engines and carriages freely to pass from line to line throughout the country. A line called the Great Western had been laid down through a certain tract of the country, with an exceptional width (or gauge as it has been called) of 84 inches; and from this line subsequently branches were extended, having, of necessity, the same gauge. It was, of course, evident from the beginning, that this system of exceptional lines, now amounting to 240 miles, by the adoption of a different gauge, dissociated itself from all other British railways; the commerce of which could never flow into it, nor could they receive from it any commerce except by transhipment. It was said at the time, by the superintending engineer of these lines, that the departure from the ordinary gauge was 'undoubtedly an inconvenience. It amounts to a prohibition to almost any railway running northward from London; as they must all, more or less, depend for their supply on other lines or districts where railways already exist, and with which they must hope to be connected. In such cases there is no alternative. The Great Western Railway, however, broke ground in an entirely new district in which railways were unknown.

It can have no connection with any other of the main lines; and the principal branches were well considered, and almost formed part of the original plan; nor can these be dependent on any other existing lines, for the traffic which they will bring to the main trunk."

\* Report of J. K. Brunel to Directors of Great Western Railway. 1838.

The commercial isolation of this exceptional system was, therefore, contemplated by the engineer and directors, and consequently no inconvenience to themselves or the public was feared. Indeed none, in that case, would have ensued. But, in the event, the development of railway transport far transcended the anticipations of the engineer and directors of the exceptional gauge, as well as all the rest of the world; and, contrary to their expectations, the ramifications of the general gauge have already come into contact with those of the exceptional gauge; and experience has proved Mr. Brunel to have fallen into a serious error, when he declared, so explicitly, that the exceptional system could never derive its traffic from the general lines of the country. One point of contact has been produced, and a line of others must ensue. The question then arises, what is to be done?

The narrow strip of England, extending westward from London towards Bristol and Exeter, where the exceptional system of railways now prevails, is about to be insulated from the remainder of the country, north and south. It will be, so far as regards railway communication, as though it were separated from the rest of the kingdom by a river, too wide and too deep to be crossed by a bridge. The commerce between it and the districts north and south must be conveyed by ferries at each point, on the banks of this river, where the railways respectively abut. Passengers arriving on either side must leave their carriages, taking with them their *impedimenta*, great and small—such as great-coats, umbrellas, parasols, and carpet-bags. And all this must happen night and day, in fair weather and foul. The wife and children must, equally in the pelting storm, and in the darkness of night, bustle their way through the mud from the one train to the other. The trains of merchandize must all be unloaded and unpacked on one side, and reloaded and repacked on the other; to the loss and damage of the owners, and delay and cost of transit; for *some one* must pay for all this labor, and who that *some one* shall be, it is not difficult to tell. Regiments of porters must be maintained at these limits of the exceptional gauge; and must be relieved by relays from time to time, for the work will be incessant night and day. And this is to be going on perpetually through the year, and from year to year, as long as railways shall endure, along a boundary line running on both sides parallel to a main railway, 200 miles long!

But it may be asked, whether there is no countervailing advantage to set off against this intolerable evil? A long and expensive inquest has been held on the matter by the Queen's Commissioners, duly appointed, and a ponderous mass of evidence has been collected. The result is, that either, the ordinary or the exceptional system of railway affords all the safety, comfort, regularity, and speed, which the public can possibly desire; that they both have ample power and capacity to satisfy all the wants of commerce which either exist or can be

reasonably anticipated. The partisans of each system contend for relative superiorities in various respects; but the differences claimed are so minute as to be discoverable only by those pledged to the success of the one system or the other; and are such as cannot, in the remotest degree, interest the public.

The magnitude of the nuisance, then, being admitted on all hands, and the utter impracticability of all expedients suggested for its abatement, nothing remains but to remove it; either by replacing the general gauge of the country by the exceptional gauge (which would render necessary the enlargement of all bridges, viaducts, tunnels, embankments, and cuttings, and a reconstruction of the stations and depots), or to bring the rails on the 240 miles of exceptional lines closer together, and modify the carriages and engines accordingly. The former measure is of course out of the question, but the latter could be accomplished, without interruption to the traffic, at a cost of something less than a million sterling.\*

It is contended, however, that the exceptional lines having been constructed under the sanction of an act of Parliament, the shareholders could not with justice be required to subject themselves to such an expense for the common good; that still less could the shareholders of other lines be so required. We are not disposed, nor will our limits allow us, to discuss this question of vested rights. But it appears to us very evident, that the British public cannot, and ought not to suffer itself to be made the victims of this nuisance; and that if the expense of its abatement can be obtained, consistently with justice, from no other quarter, it must come from the public treasury.

When the earlier railway bills passed the legislature, the privileges and rights contemplated, as well by the companies as by Parliament, were merely those necessary to enable them to construct and maintain a road, which was to be open to all who might desire to use it, on the payment of a certain toll to the company. In fact, at that time, a railway presented no condition or features to distinguish it essentially from any other highway. But simultaneously with the

\* The question of the relative merits of the two gauges, involving many complicated points of practical engineering, is one upon which all that part of the world beyond the immediate profession of civil engineers, can only judge by the weight of authority on the one side, and the other among the members of the profession itself. Perhaps there never was a question on which so little real practical difference of opinion prevailed. Nearly the entire profession of England are in favor of the ordinary gauge. A few, *were it all to do again*, would have adopted a somewhat wider, but not the exceptional gauge. But none would now think of disturbing the uniformity which all agree to be of paramount necessity. The engineering profession of France, Belgium, the Germanic States, and other countries of Europe, and that of America, have adopted the ordinary gauge (56½ inches), although they were free to have selected a wider one. Thus, so far as regards engineering authority, we have in one scale the entire engineering profession in every country in the world; and in the other, the solitary individual authority of Mr. Brunel.

construction of these roads, the invention and improvement of the machinery for transport on them, made advances. The locomotive engine broke its shell and emerged in its incipient form. Its growth was rapid and precocious. The vehicles which it drew, and in which the business of transport was executed, were novel. In a word, a system of carrying mechanism, of an entirely new structure, was produced. This mechanism was made for the railway, and the railway made for it. The system had unity and connection. It was impossible to separate it; and the carrying business could only be conducted by those who had the direction and management of the railway. The companies, therefore, found themselves—by a necessity arising from the very nature of things, and whether they liked it or not—carriers as well as road-owners. Not only was this the case, but they were necessarily the *only* carriers. It was impossible even to imagine the public bringing their private engines and private carriages on the road. A colossal monopoly, never contemplated by Parliament, nor even foreseen by the companies themselves, had come into being.

The moment that it became apparent, in the practical results of the operation of railway in England, that these lines of communication must displace, in a great degree, if not altogether, the public highways, as well for the conveyance of passengers as for the transport of merchandize, it was perceived, in other countries, that the right of the state over all high-roads must be equally asserted over the new ways of intercommunication which were about to be substituted for them. But a further and more stringent power was everywhere claimed, as the consequence of the inevitable establishment of the monopoly of transport on these roads. The state must either assume that monopoly itself, as it does universally in regard to the conveyance of the correspondence of the public; or if it were conferred on private bodies, it must be under rigorously prescribed conditions and limited periods. Such were the broad general principles assumed, admitted, and acted upon, in every country of the world—*Great Britain alone excepted*.

In some cases, it was the policy of the state to reserve to itself not only the construction but the maintenance and working of the principal railways. An obvious advantage attended this. If it seemed expedient to the legislature, the transport of goods and persons might be used as a source of revenue; as the conveyance of correspondence generally has. Or, if the state were guided by a different policy, and considered facility of intercommunication an advantage paramount to revenue, it could fix the tariff so that the net produce would merely pay the expense of transport. Thus, as England sacrificed a portion of her revenue for the public advantage of a *penny postage*, other countries might consider it good to establish a system of *penny travelling*. The indirect advantages to the exchequer might more than balance the revenue lost.

Belgium acted on this principle with complete success. All the principal railways of that country are in the hands of the state; and the tariff is so regulated as to produce about four per cent. interest, on the capital invested in the construction of the lines.

In cases where the state decides against working the railways, it sometimes, wholly or partially, constructs them; and then lets them for a term of years, to a company who pays a premium for the lease, and completes the lines at its own charge, if they are unfinished. In these leases, there are various clauses restricting the power of the company—reserving a right of revision to the state, fixing the major limit of the fares, the conditions on which the state can cancel the lease, and the terms on which the line is to be surrendered by the company at its termination.

In Austria, the railways were, in the first instance, conceded to companies on leases for fifty years. But, subsequently, the government recovered by purchase the roads, and now for the most part the railways are under the control and management of the state.

In Prussia, the construction and management of railways are conceded to companies, subject to the control of the state. The tariff is subject to revision by the government, and the profits are not in any case to be allowed to exceed ten per cent. The companies submit their accounts annually to the Minister; and when, by a sinking fund established on prescribed conditions, the capital has been replaced, the tariff is to be so modified that the profit shall not exceed the expenses of the working lines.

In Bavaria, the lines are leased to companies for a term of years, the tariff being revised by the state annually, for the first three years after the opening of each line, and subsequently every third year. Privileges are in some cases conceded to companies—such as exemption from, or reduction of, the import duties for materials, and gratuitous occupation of the state lands. In some cases the state levels the ground at its own charge; in others, it executes the earth-works. In fine, the establishment of railways is generally a matter of bargain between the state and the company. The latter receives a lease for a term of years, for which it pays a certain premium. This premium is expended in the total or partial construction of the road. It submits to certain clauses authorizing the interference of the state with its tariff; and at the expiration of the lease, receives a fair value for its stock of moving power and machinery for transport.

In France, the system of railways, with a few exceptions, has been planned, and in many cases constructed, by the government, through the intervention of the department *des ponts et chaussées*. Ultimately the line is offered to competition by the Minister of public works, who names the major limits of the duration of the lease, and rate of the tariff. The company or individual who, complying with the other conditions, offers

in sealed proposals to accept the shortest lease, obtains the grant.

Before the successful establishment of some of the earlier passenger lines, the French government found it necessary to extend some further inducements to attract capital to these enterprises. Thus, in the cases of the lines from Paris to St. Germain, Versailles, Rouen, and Orleans, leases of ninety-nine years were granted. Since, however, the results of these first lines have become known, and capital has been elsewhere more generally attracted to railway enterprises, the state has effected much more advantageous bargains. The great northern line to Brussels has been taken on a lease of thirty-eight years; the Orleans and Bordeaux on a lease of twenty-eight years; the line from Tours to Nantes on a lease for thirty-four years. Of the entire system of French lines, there are not more than one hundred and twenty miles granted in perpetuity; and these are chiefly coal and mineral railways; established long before lines for passengers and general traffic were contemplated.

In the United States, the state governments have generally reserved, in one form or another, a right of control over railways. In some cases, they are themselves the chief shareholders; in some, they have lent to the companies capital at a low rate of interest; in some they have given the guarantee of the state for the capital raised. In all such cases, the right of control is admitted. In some cases, the dividends are limited to ten per cent, the legal interest of money being six or seven per cent. In some cases there is reserved a right of revision of the fares every four years. In some of the principal states—New York, Pennsylvania, and Virginia, for example—the charters of the companies contain a clause investing the legislature with an absolute right at any time of modifying them. Subject to such conditions, the railway charters in some states are not limited in duration; but in the principal states the duration varies from fifty to one hundred years.

By the system so widely pursued in France, and most other countries, the advantages arising from private enterprise are combined with sufficient security for the public, against the abuse of the powers entrusted to railway companies. Not only is a general power of supervision and control reserved; but the tenure of the companies being limited in duration, the entire internal communications of the country must revert to the state after a certain period. Thus, at the expiration of forty years, all the chief railways of France will be in the hands of the government; and in about ninety years, private companies will cease to exist—unless such as the government may think fit to re-constitute.

It thus appears, that England is the only country in the world whose legislature has committed the singular imprudence, of surrendering, without available conditions, and for an indefinite time, its public communications into private hands. That such mono-

polies can continue to exercise the powers granted to them, without the abuses to which all monopolies have been obnoxious, is not to be conceived. There are already tendencies manifested to struggle for the private objects of these bodies, against the fair claims and interests of the public. The railway companies, as they first acquired their rights of incorporation, were numerous. Each line was a separate property, and ruled by a separate Board of Directors. Although it appears that no such thing as a competing line is practicable, yet in this multitude of lines, there might be expected something approaching to competition; many small monopolies, it might be hoped, would check each other. The practice of amalgamation and combination, which has begun already to prevail so extensively, must, however, dispel these hopes. The lesser companies are severally gravitating towards, and coalescing with the greater bodies; and instead of a great number of small monopolies, in which the system commenced, it is now tending towards a small number of great monopolies, in which it must ultimately terminate.

The indisputable existence of these monopolies, and the liability of the abuse of their powers to the prejudice of the public, necessarily seems to infer the assumption of a corresponding control on the part of the legislature; for to suppose the indefinite continuance of an arbitrary power over the personal and commercial communications of the country, exempt alike from the operation of competition and legislative control, is an absurdity too palpable to be, by any one, seriously asserted.

It may, however, be contended that no case for interference has yet arisen, and that, when it occurs, it will be time enough to provide for it. But is it not certain, that measures have been already taken to neutralize the competition of the canals in the transportation of merchandise? It was proved before Mr. Morrison's committee, that some of the companies have already succeeded in getting possession of portions of canals, on which they have raised the tolls to their parliamentary limit; thereby paralyzing the business of the entire line, and driving the traffic to the railway, on its own terms. It is proved also, that in order to evade the provisions, few and ineffectual as they are, which the Legislature has made to check the evils of their monopoly, the larger and more powerful companies have created fictitious shares in enormous numbers, so as to make their capital appear larger, and their profits consequently smaller, and thus to exclude parliamentary interference, in the only case in which it was contemplated.

It may be said, that as Parliament has established limits to the tariff of railway traffic, so long as the companies keep within these, they should be subject to no interference. To this, however, it may be answered, that when these limits were fixed, the legislature had no sufficient data by which an equitable amount could be established. Can it for a moment be maintained,

that if, by any new inventions, railways could be constructed by the expenditure of half the capital sunk on those now open, and worked at half the present current expense, the public would not have the right to demand a proportionate reduction in the carrying tariff?

"If a new line could in any case be constructed for half the expense of an existing line, or, supposing the expense to be the same, if it were constructed by parties who would be satisfied with a dividend of five instead of ten per cent, parliament is bound to sanction the new line, unless the company make a corresponding reduction in the fares on the present line. One or other of these results must take place; for if the principle be true, that capital will force its way into those employments which yield more than the ordinary rate of profit, it will be impossible to maintain the monopoly and the high charges of the old companies."

The fares on British Railways are higher than on any other European lines. The first-class fares are sixty-three per cent. higher than those on the French and German railways, seventy-five per cent. higher than the Belgian, one hundred per cent. higher than on the Italian, and one hundred and sixty per cent. higher than on the Danish lines. The second-class fares are fifty per cent. higher than those of France and Germany, and one hundred and twenty-five per cent. higher than those of Belgium and Denmark. They are one hundred per cent. higher than those of Italy. The third-class fares are sixty-six per cent. higher than in Belgium, one hundred per cent. higher than in Denmark and Italy, thirty-three per cent. higher than in Germany, and fourteen per cent. higher than in France. In no other country are the working-classes conveyed in a manner so discreditable to humanity, and to the true interests of the carriers themselves. In short, it is evident that the abuses which have at all times and everywhere attended monopolies, have already manifested themselves in our Railway management, and are certain to augment, to the great prejudice of the public.

It would be folly to close our eyes upon the fact, that the British public has committed a serious error, in permitting the Legislature to proceed from session to session, in the course of legislation which has prevailed in regard to railways. With an enlightened public, a vigilant and free press, an unrestricted right of discussion and petition, and the habit of the legislature to wait for the expression of public sentiment on such matters, it would be unjust to throw upon Parliament, or the administrations of the day, the exclusive blame of the mistake that has been committed. The public itself must bear the principal share of that blame. What is the actual state of the case? A new method of intercommunication was discovered, infinitely exceeding all former methods in cheapness, expedition, certainty, and regularity. Surely this rare opportunity ought to have been seized, to procure

the establishment by law of a suitable administrative body, under which a prudent system of inland communication might be constructed. But what, in fact, has been done? In this, the most active country in the world, with a press absolutely free, with unparalleled facilities for the diffusion of knowledge, and the most perfect of all representative governments, we have passively surrendered the entire system of national highways, without a single practicable reservation or exception, into the hands of a number of private individuals, to deal with us and our posterity, so far as respects our intercourse with each other, as may seem best to them and their heirs, now and forever. England has ceased to possess highways. The country is intersected only by roads, which no one can use except by the permission and on conditions prescribed by their owners!

Although it be not till the eleventh hour, still, the attention of Parliament has been called to this most important subject; and measures are in progress which, it may be hoped, will correct these evils, as far as retrospective legislation can correct them. The right of Parliament to establish a system of reasonable control over the inland communications of the country, cannot, as we conceive, be denied. All practicable competitions having ceased to be possible, administrative control must supply its place. A Board of Railway Control must be established. But, to be really useful, it must be invested with powers much more extensive than those possessed by the late railway department of the Board of Trade. The great object of the government should be, to bring the power of such a body to bear on the existing railway companies, in such a manner as to protect the public from the abuses incidental to them, without violating in spirit that contract, whatever it may be, which they may have made with the State. The benefit of such a system of control, rightly administered, will not be confined to the public as opposed to the monopoly of the companies. It will extend to the companies themselves—some of which have already discovered that the maximum of profits is not necessarily attained by the maximum of fares; and that it is possible to consult the interests of the Public, by moderating their tariffs, without endangering their prospective dividends.

#### Lewiston and Waterville Road.

The Portland, (Me.) Advertiser says that, some very interesting statistical facts have been placed before the public in relation to this road, which cannot fail to have produced an impression favorable to the project. This is no visionary scheme—no idle speculation, but a grand, substantial, practical measure, which must give large and permanent prosperity to Maine. We do not fear contradiction when we say that it will form the grand trunk of railroad communication through the state. Before it is completed to Waterville, measures will be in progress to extend it to Bangor, where it will then have but half accomplished its object.

The length of the contemplated road from

the present terminus of the Atlantic and St. Lawrence road, to Waterville, is about 48 miles; the estimated cost of the road with all its equipment falls short of one million of dollars. The road extends into the midst of a fertile country, occupied by a busy, active and enterprising population; and taking all things together, the most productive in the state.—It passes through towns and villages full of manufacturing industry and resources, which send now to the sea board their thousands of tons of produce and manufactures, and their tens of thousands of passengers annually.

The road will command the business of the counties of Franklin and Somerset, and a considerable portion of Kennebec, Piscataquis and Waldo, to which it will afford facilities, which will give an immensely accelerated force to all their resources and energies. The people upon the whole line of the road and through the large region which will be opened to a market by it, are prepared for action. They have already resolved that the work shall be done. They have commenced a liberal subscription toward it, to which liberal additions will be made. They ask of Portland to respond to this noble effort; they say, give us \$100,000 or \$150,000, and we will soon send into your beautiful city, trains of freight and passengers which will astonish the incredulous.

And will not Portland heartily respond to this patriotic call? It is but loaning the money on the best security. The recent dividends of 4 per cent. semi-annually, in the Lowell, Providence, Worcester, Taunton Branch and Eastern roads invite us to invest; and from a careful comparison of all the statistics relating to this projected road and those of Massachusetts, we do not hesitate to say that the stock in none of them will go before that in the Lewiston and Waterville company for the amount of profit.

By a vigorous action now, we shall secure this great privilege: we strengthen the hearts and hands of its friends in the country, and give it an impetus which will push it through every obstruction.

We hazard the prediction, which may seem bold to some, that when this road is completed, or even before, a branch will be made to Gardiner or some other point on the Kennebec, which will afford a cheaper mode of communication than any they will otherwise have between the river towns, and Portland and Boston.

Railroads are the great works of our day; they furnish the most desirable means of investment; they open uncultivated lands to a profitable and useful culture; they give life, activity and value to unemployed water power, dormant energy and capital; they build up waste places, increase the power and prosperity of states, and promote national aggrandizement.

Let the people of Portland come forward now and aid this great enterprise, which will give a permanent prosperity to all their interests. They have done nobly for the great Canada road, and for the iron company which is to put on it, the winged steeds; "Once more into the breach my friends, once more!"

Correspondents will oblige us by sending in their communications by Tuesday morning at latest.

## AMERICAN RAILROAD JOURNAL.

Published by D. K. MINOR, 105 Chestnut St., Philadelphia.

Saturday, January 9, 1847.

## PHILADELPHIA, WILMINGTON & BALTIMORE RAILROAD.—1847.

### Winter Arrangement.

Philadelphia for Baltimore... 8 a.m. and 4 p.m.  
Baltimore for Philadelphia... 9 a.m. and 8 p.m.  
Connecting in Baltimore with Mail Lines south and west, as per notice of the Baltimore and Ohio Railroad—and with Mail Lines north from Philadelphia, both morning and afternoon.

Sundays, the Morning Lines do not run in either direction.

Accommodation train from' Wilmington to Philadelphia, leaves Wilmington at 8 a.m., and returns at 2 p.m.

J. R. TRIMBLE,  
Sfr Engineer and General Superintendent.

### Little Miami Railroad. Superintendent's Report.

In another portion of this day's Journal, appears the Superintendent's Report of the Little Miami Railroad Company, for 1846. The reader is referred to the official document, for the details of the condition of this road—by which it will be found that the receipts have reached a higher amount than was looked for, at the last annual report—though the amount does not come up to the maximum, which the business of the country would have guaranteed, but which has been lost to the road, on account of the deficiency of their motive power. An additional business is brought to this road, by the opening of the line to Springfield, but a very serious accident which occurred by a collision on the 13th of August last, the failure of the builders to furnish (as per contract) certain locomotives and cars, in season for the fall trade, and other causes, duly enumerated—account for the deficiency of the receipts; matters which will be corrected at an early day, if the recommendations of the able superintendent are acted upon. Mr. CLEMENT has exhibited the most untiring energy in the discharge of his duties as Superintendent upon this road, and we are glad to learn that the prospect ahead, promises very favorably for the company.

### Central (Pa.) R. on the Canal Towing Path.

We find, in a recent number of the United States Gazette, a communication from F. P. Holcomb, Esq., in relation to the construction of the Central Railroad to Pittsburg, on the towing path, or bank of the canal. He goes into the calculation, and makes it appear that the cost of construction—in the event of using the Portage railroad as a part of the line—will be much less, and the line much better, than by any other route yet indicated. He might also have said—what is equally important—that it can be completed in less than half the time of any other line.

If Mr. Holcomb's suggestions meet with equal favor in this, as in another case—we refer to the New Haven canal—he may consider himself highly complimented. By referring to the tenth volume, page 360—or the number for June 15, 1840—of the Railroad Journal, will be found a communication dated "Engineer Camp, Central Railroad, Georgia," in which he recommends the construction of

a railroad along the canal to Northampton, and gives an estimate of its cost. Little disposition, it is true, was then manifested to carry out this suggestion; and years passed before it was acted upon; but the work is now in course of construction, for at least a part of the way; and so may his more recent proposition meet with favor. We shall give his letter at length in our next—long as it is for our pages—that he may speak for himself.

### Iron Rails in England.

We are indebted to an eminent mercantile firm in New York, for the following extract of a letter, giving the results of practical experience in England on this subject. They say "it has been ascertained by practical experience in England, that the rail, necessary for rapid movement over it, or for the conveyance of merchandize, should be heavier than the rail now in use there. The extract from a letter now before us—written by a practical and intelligent gentleman in England, largely interested in railroads now under construction in the United States, and of course desirous that said roads should be well constructed for speed and heavy traffic—says, (under date of 2d December, ultimo:) 'The experience we have obtained here, is, that the usual weight of iron heretofore used, of say sixty-five pounds to the yard—will not suffice for the rails—if the speed of travel and weight of traffic is to be carried forward. Our express trains now travel from forty-five to fifty miles per hour, and carry enormous weight of merchandize, which has already led to the necessity of changing the weight of rail to eighty pounds per lineal yard—and many are calculating on the necessity of going to one hundred pounds per yard—as a matter of economy to guard against the necessity of taking up a lighter and laying down a heavier rail. We call your attention to these points, and request you to so state it to the companies now constructing roads, in which we may be stockholders—that they may avail of our experience in this country as a guide to a right construction of a road intended for rapid travel and conveyance of produce and merchandize.'

Our own observation has led us to the same conclusion; and we have no doubt but that, on all our main lines, rails of 75 to 100 lbs. to the yard will be ultimately used; it is therefore important that they should, as far as possible, be constructed originally with the heavy rail.

### Atlantic and St. Lawrence Railroad.

In reply to our request, we have the following interesting letter, dated Portland, December 26, 1846, from Mr. Septimus Norris. He says:—"According to promise, I now beg to hand you, enclosed, a map, showing the different railroads connecting the Atlantic cities with the western lakes; and, at one glance, it will be perceived Portland has by far the greatest and most unquestionable advantages over any other Atlantic city, being but 280 miles—Boston 525—New York 475. I would suggest to you the propriety of having a wood cut made of a map half the size sent you, showing the different routes—and, as I can get no better or more correct information, I have the consent of A. C. Morton, Esq., chief engineer of the Atlantic and St. Lawrence railroad, to make my extracts from his report, a copy of which I also send you."

There is but one summit, or main dividing ridge, between the waters which flow into the St. Lawrence and those flowing into the Atlantic; and the approach to the summit is through the valleys of large streams, affording long and easy slopes for overcoming its elevation. The principal highlands intervening between the St. Lawrence and the At-

\* We have received the map, but not the report alluded to.

lantic, are the White and Green mountain ranges. The former is crossed through the valley of the Androscoggin and Ammonoosuck rivers, with no inclination exceeding 40 feet per mile; with but a slight undulation in the grade of the road, and no heavy work whatever. The latter extends into Canada, but falls off as it approaches the St. Lawrence basin, and is principally avoided by following the valley of the St. Francis and Black rivers. There is no line of equal extent, connecting the western waters with the Atlantic which will compare with this for the great extent of easy grades, straight lines and cheap construction. While other lines are subjected to great disadvantages from steep grades, abrupt curvature and excessive cost, this is happily exempt from nearly all.

A large portion, equal probably to one-half the whole of this road, will be either level or of inclinations not exceeding 20 feet per mile. The curvatures are all easy, and nearly equivalent to a straight line. Passenger trains may pass on the whole road in the space of ten hours, and the largest class freight engines will be able to transport 200 tons over the road in either direction.

As regards the cost of transportation on the St. Lawrence and Atlantic railroad, the most satisfactory information would be gained by comparing it with some line of nearly equal extent and facilities and designed for general trade.

Perhaps no other road, at present in operation, approaches nearer to it, as it regards its object and design, than the Western railroad in Massachusetts; yet the cost of transportation on this road will much exceed the St. Lawrence and Atlantic, from the more unfavorable character of the grades and large amount of curvature. On the Western road there are three elevated summits, to surmount which the following grades are required, to wit:

3	miles of 60 feet per mile.
14	miles of 68 and 69 feet per mile.
5	6-10 miles of 74 feet per mile.
6	miles of 78 and 79 feet per mile.
2	miles of 82½ and 83 feet per mile.

The total rise and fall is over 4000 feet. The length of curved line on this road is 75½ miles, or 48 per cent. of its whole length, and the minimum radius 859½ feet.

Relative to the grades on the road from Montreal to Portland, the inclination probably, on one-half the whole distance, will not exceed 20 feet per mile. The maximum grade, as indicated by the surveys thus far, will be 50 feet per mile, and this is confined to comparatively a short distance. It is believed that from 80 to 90 per cent. of the whole road will be straight, and the curvatures will be easy.—In the comparison, therefore, of these roads, it is believed that we are fully sustained by the above facts in the conclusion that the cost of transportation on this road will not equal, but fall considerably below that on the Western road.

The gross receipts of the Western railroad for 1845, was.....	£203,300
The total expense of operation of the road for 1845, was.....	92,655

The net income was.....£110,715

The St. Lawrence and Atlantic, and the Atlantic and St. Lawrence railroads,\* will be about 280 miles in length, 130 miles of which are in Canada, and the net annual income, supposing it to be in the same proportion as the Western road, and the cost of the road, £2,000,000, will be equal to an annual dividend of 10 per cent.

It will be observed that, in the above estimate of

\* The first extending from Portland to the line, and the latter from Montreal to the line.—En. R. R. J.

revenue, it is assumed that the cost of transportation on the Atlantic and St. Lawrence road will be as great as on the Western road, which evidently will not be the case. And it is also assumed that the cost of the whole road to Portland, will be two millions pounds currency; which is a much greater sum than it has been estimated to cost.

Applying as above, the business of the Western road for 1845 to the Atlantic and St. Lawrence, and assuming the cost of the road to be £1,750,000, the net revenue gives a dividend of 11½ per cent.

In the construction of the Western road, great obstacles were to be overcome. A mountainous section of country was to be crossed, requiring, as already stated, heavy grades and a large expenditure of money. To give an idea of the formidable obstacle encountered, I would state that one section of this road, known as the Mountain Division, comprising a distance of 14 miles, cost £245,000 or £17,500 per mile, and a single mile cost £54,982. The total cost of the road up to January 1, 1846, was £1,999,888.

In its business, it has to contend with a strong competition, with steamboats on the Hudson river and another railroad. Notwithstanding these unfavorable circumstances, the gross receipts in 1845 was, £203,307, and its net receipts for the present year, will probably equal a dividend of over 6 per cent. on its cost.

With reference to the Atlantic and St. Lawrence railroad, as a great thoroughfare, it occupies a most remarkable position, connecting, as it does, the St. Lawrence and the Atlantic, at a point where the New England coast approaches the nearest to the western waters, and having a large and populous city at either terminus, with capacious harbors and a rich intervening country, it cannot fail to be one of the most important and profitable roads yet commenced. From its peculiar position it never can be subject to competition. It is the shortest and cheapest channel through which the travel and trade of the provinces can reach the sea board.

With a long line of natural and artificial communication connecting Montreal with the western waters, and the far west, it cannot be doubted that the completion of this last link will change entirely the channel of trade; open new resources; and add vastly to the business of the public works of the province, and to the wealth and enterprize of the country through which it passes. To the city of Montreal it is of vital importance, situated, as she will be, at the foot of this long line of communication on the one hand, and within 10 hours ride of one of the best harbors of the Atlantic coast on the other, she must unavoidably receive large accessions to her trade and commerce, and a vast increase of wealth.

The foregoing, and an inspection of the map, will prove to any ordinary mind that Portland is destined to be a great commercial city, and will, in a few years, go far ahead of Boston.

You are, perhaps, aware, that I have received a contract from the Atlantic and St. Lawrence railroad for all the engines, car castings, etc., required for this road, all of which are to be built in Portland. I am also in treaty with them for the supply of all their rails, to be manufactured here.

A company has been chartered, and stock subscribed to the amount of \$250,000, called the Portland company, of which I have the appointment of director and chief engineer. We have purchased about eight acres of land in the city of Portland, having a wharf on the harbor of 900 feet, upon which our buildings are now erecting, and, by the 1st of April, I hope to have 500 operatives at work,

manufacturing rails, locomotives, cars, castings, etc., for the Atlantic and St. Lawrence railroad.—Portland has now become my home, and I assure you I have no regret at leaving Philadelphia, where I have resided for the last ten years, for I have been received here by the citizens with great cordiality, which makes me already feel at home.

I will, if you wish, again address you, giving you the progress of the Atlantic and St. Lawrence Railroad, etc., which, no doubt, will prove interesting.

Your friend, sincerely,

SEPTIMUS NORRIS.

#### Railroads—The Telegraph—Sundries.

We collate from our list of exchanges for the last week, the following items of interest.

The whole amount of the stock of the New York and New Haven road—\$2,500,000—has been subscribed without condition, and the contractors and engineers are busily engaged on the line preparatory to letting the sub-contracts.

From the late letter of Mr. McLane, president of the Baltimore and Ohio Railroad, the *Pittsburg* journals have discovered that their city was not to be benefited by the grant of the "right of way," so much as they supposed. Mr. McLane very frankly admits that the object sought was a connection with the Ohio river at a point much lower down than Pittsburg, and the connection with Pittsburg only a subordinate aim. The avowal has abated the zeal of the people of Pittsburg, and they are advised, through their journals, to cease to look forward to a connection with *Baltimore*, and direct their means and energies to other works—those of connection with Philadelphia or the lakes.

The *New York Journal of Commerce* states that upon the canal railroad, leading from New Haven to Collinsville, along the line of the Farmington canal, the grading is already commenced. On the line from New Haven to New York, it is to be commenced in a few days. The Hudson river railroad is gaining considerable accessions to its subscription list, and its friends are increasingly confident that it will be made, and that speedily. The Housatonic railroad gets nearly all the travel from Albany to New York. The Erie is going forward with a good deal of energy, and measures are in progress for connecting at several points by lateral railroads, with the railroad from Albany to Buffalo. A general convention of the friends of the Air line railroad from New Haven to Boston, is to be held at Middletown in the course of a week or two.

The bill to charter a railroad from Raleigh via Fayetteville, to Camden, S. C., as well as the bill to charter the Wilmington and Manchester road, have been passed by the North Carolina Legislature.—South Carolina (just adjourned) also granted similar charters.

We learn from the *Kennebec Journal*, that the citizens of Hallowell held a meeting at the town hall on Wednesday evening, on the subject of the railroad. A report was made of the state of the subscriptions in that town, and measures taken to increase them. The meeting was addressed by gentlemen of Hallowell, Gardiner and Augusta, and before adjournment, it was voted by acclamation that a mass meeting for the towns of Hallowell, Augusta and Gardiner be holden on Saturday last, at 10 o'clock, at the town hall, and that the citizens of those towns, one and all, be invited to attend.

At a meeting on Monday evening last, at Bath, the project of a railroad from Portland to Augusta, Me., by way of Brunswick, with a branch to Bath, was considered by the citizens of that place; and it was resolved, unanimously, that the citizens of Bath

will have a railroad under the Portland and Kennebec charter; and that said road should eventually pass through Waterville to the Penobscot; and that they are opposed to any railroad from Portland to the Kennebec, that does not connect with Brunswick and the principal towns on the Kennebec river. It was also resolved, that it is expedient—and the directors are requested—to commence the railroad between Brunswick and Portland, as soon as in their opinion a suitable sum is subscribed therefor. This is a good move, and we are happy to see the disposition evinced in Maine, to have a railroad connection between their commercial city and the capital of the state.

We regret being obliged to allude to a most discreditable occurrence, which took place at the Tabernacle, in New York city, last week, upon the occasion of a meeting of the citizens there, to give Mr. Whitney a hearing upon the subject of his great railroad project to Oregon. However parties or communities may differ in opinion in regard to the feasibility, or present practicability, of this immense scheme, or in reference to its originators, we cannot but enter our protest against all attempts like the one we speak of, to injure the projector or the plan, by such means as seems to have characterized this scene. It appears from the *New York accounts*, that the meeting was called in due form, and the Mayor of the city was called to the chair, but while Mr. Whitney was explaining his views, there was considerable noise from certain of the national reform party gentlemen, who think that what the nation possesses, ought to be divided at once among the people! After Mr. Whitney had closed, a Mr. Ryckman made a speech against the plan. He had some resolutions which he would read, in spite of the call of his own party for a person named Shepherd.

The *Courier and Enquirer* adds that, "having got through these MS. resolutions, the cry for *Shepherd* was most tumultuously and uproariously renewed and continued—until it soon became manifest that no rational proceedings could be had, and after in vain endeavoring to restore order, or obtain a hearing, his honor the mayor, after consulting with some of the Vice Presidents, put on his hat, and with the other members of the meeting, left the platform, declaring the meeting dissolved. An instantaneous rush was made for the platform, by these friends of equal rights and universal agrarianism, and a Mr. Comerford began forthwith to hold forth to all who remained in the tabernacle; when, in the mid volley of his eloquence, the gas was turned off—and sudden darkness fell alike upon audience and orator. The effect was electric—with a shout of laughter, the disturbers turned from the invisible spectre and groped their way hastily into the wet streets.

"And thus disgracefully ended a meeting, invited under the most respectable auspices, of citizens, calmly to consider a great national project—in which this city has a special interest. The disturbers were men who, for the most part, have little or no interest in the city, and whose element of existence and notoriety seem only to be strife and opposition to all settled principles and established law.

"It was the triumph of agrarianism—lawless as landless—and well fitted to make reflecting men shudder, when a peaceful and legal meeting, for an honorable and patriotic purpose, could thus be converted into a bear garden."

Our regret for such an occurrence is most sincere. The great commercial emporium of the "Empire State" should do better—and treat a project of this character rather differently.

GOVERNOR SHUNK alludes to the great Central (Pa.) railroad as follows, in his late message. He says—"Some apprehensions have been expressed, that the construction of the great Central railroad, between Philadelphia and Pitsburg, may be the means of diminishing the income from the improvements of the state. In this I do not concur; on the contrary, I entertain the opinion, that the increased commerce which it will invite between our great eastern and western emporiums, and the regions which connect with them, will not only add to the revenue of the Columbia railway, but will greatly increase the productiveness of all our public works. Such, I believe, has been the experience of New York, and such, I doubt not, will, in a very few years, be that of our own commonwealth."

An exchange paper states that the first bar of American railroad iron was made in 1844, and there are now sixteen or eighteen mills, at which it is made; at the rate of about one hundred and twenty thousand tons per annum. This amount is sufficient to lay four miles of railroad per day, or twelve hundred miles per year. The progress of this manufacture, in the short space of two years, in this country, is very remarkable and is a striking manifestation of American enterprize and skill.

We perceive by a paragraph in the New York Sun, that Mr. Isaac Meikle, of Camden, N. J., is applying gun cotton to the propulsion of machinery in his factory. The engine is constructed on the ordinary horizontal steam engine, only there are two cylinders, one working in the other. The gun cotton is ignited by electricity, engendered and applied in a novel manner. Any degree of power may be obtained. It is said to be safer than the ordinary steam engine, and one person can run it.

Telegraph lines are being extended rapidly in all directions, and the time is not far distant when the extremes of our land—east, west, north and south—will be brought, by this means, within a few hours, perhaps minutes, of each other.

But a few days since, a message was transmitted along the lines from Buffalo by the way of New York and Philadelphia to Pitsburg, a distance of 950 miles by the wires, and an answer returned to the starting point in less than two hours, counting all detentions it met with at the different stations. Nineteen hundred miles were thus traversed in this short space of time by the message and the response!

The line between Philadelphia and Pitsburg is now in perfect order. A slight disarrangement caused a stoppage on Tuesday, which was obviated the next day, and the communication resumed. The Pitsburg papers publish every morning, the reports of the markets in Baltimore, Philadelphia and New York, up to the previous evening. This shows the great benefit of the Atlantic and Ohio Telegraph, and the energy and enterprize of the publishers.

GOVERNOR YOUNG commenced reading his message at Albany at twelve o'clock on Tuesday, and at four o'clock in the afternoon, it was published entire in New York city, in an extra. The message contained 5,000 words, or 25,000 letters, and was written from two instruments in the Albany office, by Messrs. Carter, Buell and Johnson, and read in the New York office by the Messrs. Woods, at the average rate of 83 letters per minute, or two and a half hours for each instrument. Professor Morse's original estimate to Congress for the despatch with which communications could be sent by his telegraph, was thirty letters per minute; here we see the number almost trebled, in a long public document. The press had arranged to receive the message by two other routes, viz: one by horse down the

banks of the Hudson, and the other by the Housatonic railroad. The lightning came in first, the horse next, and steam last.

We learn from an exchange, that the New York and Buffalo line of telegraph company, have declared a dividend of three per cent. for the past four months. This is the first magnetic dividend ever declared. The earnings of the line have been about \$11,000 since 7th September, of which the expenses have absorbed about one-third. Of this dividend the patentees get \$2700, which may be considered the first practical result of this great discovery.—This line has now established the fact that magnetic telegraphs, when well managed, are a safe and profitable investment.

Cincinnati papers received up to January 4th, give some melancholy details of destruction, caused by a flood in the Big Miami on the 2d. Five lives were lost. The Cincinnati and Dayton canal is swept of bridges, and is broken and overflowed.—The Whitewater canal is almost irreparably damaged. The loss in lumber, flour, hogs and pork, is immense, and the destruction of mills, &c., is fearful.

The report of the engineer and superintendent of the Little Miami railroad will be found in this day's Journal. We have referred to it particularly, in another portion of our paper.

The interest evinced in the railroad direct from Boston to New York, is on the increase, and we are happy to find that the subject meets with general favor along the entire line of the proposed route.—We shall be greatly rejoiced when this important work is fairly under way, and present indications are decidedly favorable to its early consummation.

#### Pittsfield and North Adams Railroad.

We are indebted to William H. Power, Esq., superintendent, for the following statement.

"The winter arrangements on this road are as follows, viz:

Leaves North Adams, daily, at 8 A.M. & 4 P.M.  
Leaves Pittsfield " at 11 1/2 " & 8 "

"On the arrival of the train at noon at North Adams, stages leave for Williamstown, Hoosac, Pownal, Bennington, Manchester, Salem, Union Village, Rutland, &c.

"At Pittsfield, the trains connect, to and from, with all the W. R. R. trains, and with the mail line to Lenox and Lee.

"Length of road from North Adams to Pittsfield, twenty miles; fare sixty cents; time, one hour; stopping at South Adams and Cheshire, each way."

The contracts for the construction of this road were not made until the 20th December, 1845. It was completed and in use in 1846, and is now doing a very good and increasing business. Its extension to Rutland is not, we are sure, very distant.

#### Mining in Australia.

Within a few years past, a large number of the laboring portion of some of the mining counties of England and Wales, have taken passage for South Australia, and the emigration is increasing. The following letter, published in the London Mining Journal, is from a Mr. James Curnow, who left Cornwall for Port Adelaide in 1841, and is addressed to a friend in Penzance. If its statements be not highly exaggerated, South Australia is indeed the "land of promise:"—

I now fulfil my promise, made on my leaving in 1841, of furnishing you with some information which may be useful to many of my friends in Cornwall, and others intending to proceed to this part of the world. I shall

carefully guard against any representation that may mislead, or exaggerate, and the facts I shall state may be relied on. The most attractive element of wealth now known in the colony, is unquestionably our minerals. The quantity of copper ore jutting out on the surface, is incredible, and I am confident is not equalled in any known part of the world. The quantity of ore raised at the Burra Burra copper mines, in six months, is 2900 tons, which produce has been obtained by 30 to 50 working miners—in fact it has not been mining, but more properly quarrying. The miners of Cornwall will easily understand the importance of this mine alone: I could enumerate eight or ten others, of a most valuable description—but this one will be sufficient to show the extraordinary nature of this province in a mineral point of view; as an illustration of which, I would direct attention to the quantity of ore shipped to England, including several cargoes direct to Swansea, in the short space of two years, with a mining population not exceeding 200.

• • • • • The other metals found here are lead, silver, and gold—a rich vein of the latter having been found in several places in the virgin state. There are other metals reported to have been discovered, but which I have not yet seen—such as tin, quicksilver, platina, etc. The money paid to government within a short time, amounted to about £80,000; and on Saturday last, £30,000 worth of land was purchased at public auction for mining purposes. Besides this, one or two special surveys, of 20,000 acres each, are about to be secured by old settlers, in a new district, which is most important, as the breadth of the area of our mineral district will thereby be considerably extended. Ores having been found on the surface in numerous places for about 150 miles in length, running north, and about 80 to 90 miles in breadth, from east to west. In fact, on other parts settled, such as Port Lincoln, beyond these limits, various discoveries have been made, and yet we are comparatively ignorant of the real extent of our mineral wealth. The greatest want now felt, is the scarcity of labor of every description, but more particularly of working miners. I can state, from personal knowledge, that tributaries have been getting lately from £6 to £20 per week, and men that never saw a mine before, get £2 per week. These wages are further enhanced by the low cost of provisions and other necessities of life. To give some idea to those unacquainted with the variety of productions which abound in this colony, I may enumerate the articles of wool, grain, gum, bark, whalebone, and oil, which, themselves, are enough to make this a prosperous community. I think I may say with truth, that such a concentration of the elements of wealth that we possess, is without precedent. The climate of South Australia is most healthy. The general opinion in England as regards the supply of rain, is very incorrect. The experience of ten years shows that no real scarcity of water has been experienced during any one season. The hot winds which prevail during summer for a short time, are, I may say, the only drawback in this colony.

## Superintendent's Report.

OFFICE LITTLE MIAMI RAILROAD CO.,  
Cincinnati, December, 1846.

To the President and Directors of the Little Miami Railroad Company.

GENTLEMEN—Below will be found a statement of the receipts and expenditures of the transportation department, for the year ending the 1st inst, together with such suggestions as the experience of the past year has furnished, in relation to the management of this department generally.

The receipts amounted to a larger sum than was anticipated at the date of the last annual report, but have not reached the maximum by a large per cent which the business of the country would have allowed, had the motive power and car departments been adequate to meet the demands upon them. One only, of the four locomotives ordered last winter, has been placed upon the track in time to be of service, since the date of the last report.

This failure on the part of the builders, together with the collision of August 13th, which rendered useless for two months, the only effective passenger engines on the road, have been the fruitful sources of delay and embarrassment in the management of the road, and disappointment and loss to shippers.

The motive power is at present so deficient, compared to the demands upon it, that the most trifling accident, or the time required to make the ordinary repairs, which, under other circumstances, would not be worth a second thought, become matters of serious importance, inasmuch as the loss of a trip is involved.

Since the date of the last report, the wooden rails and cross-ties have been renewed for the distance of ten miles, between Milford and Foster's Crossings, in addition to the ordinary repairs on the remainder of the line. About an equal distance will require renewal in the same manner the coming year.

The six miles next to the city of Cincinnati, remain in the same condition as at the last report, with the exception of such repairs as were considered necessary to keep the track passable.

At several points on the lower part of the road, slides occur after heavy rains, which interfere with the business of the road during the winter months. About eight hundred lineal feet of wall has been put up to guard against these slides, and its erection will be continued as fast as circumstances permit.

I would again call the attention of the Board to the importance of relaying this portion of the road with an  $\square$  rail. Another season cannot be allowed to pass without relaying it in some manner. The thin iron at present in use upon it, can be taken for the additional side tracks rendered necessary by the increasing business of the road; which if not procured in this way, must be provided in some other, thus adding (in case an  $\square$  rail is not substituted at once) to the eventual cost of relaying with heavy iron.

The estimated cost of relaying with an  $\square$  rail, including materials, labor, ballasting road bed, etc., per mile, is as follows:

100 tons rails, chairs and spikes, at \$70. ....	\$7,000
Ballast.....	800
2300 locust ties, at \$40.....	920
Other materials and labor.....	900

Less value of old materials, say.....	2,300
	\$7,320

The cost of repairs of machinery, superstructure and road bed make up an important item of the expenditures, and this will continue to be the case, with a large freight traffic on a light plate rail like ours. Four years is the extent of time that we can rely upon the best white oak timber as a string piece, and after the third year the track frequently requires extensive repairs. A sufficient quantity of timber is on hand and under contract to be delivered, for our probable wants the ensuing year.

The trestle work over the island at the Little Miami river has been braced and otherwise secured, but will require extensive repairs, or filling up with earth at an early day. All the materials for a bridge of the longest span on the line are being delivered, and so soon as the delivery is completed, the bridge will be framed and placed under roof, ready for any emergency that may occur.

Under the head of repairs of locomotives is included damages caused by the collision of the 13th August, and replacing the frame and fire-box of the "Governor Morrow."

The attention of the Board is earnestly called to the necessity of erecting suitable shops for repairing locomotives and cars.—As at present arranged, the cost of repairs is greatly increased over what would be necessary with convenient buildings, and is attended with useless delay in many instances.

Some arrangement should be made to reduce the grades in Front street and through Fulton, or to remove the track out of the street entirely. This last will undoubtedly be the better plan, if the means of the company permit, as the street is narrow, and constantly thronged with wagons and carriages. At present an extra locomotive is employed whenever the condition of the machinery will permit, and an extra set of hands all the time.

This expense would be entirely avoided, and a considerable saving made in wear and tear of machinery, by a change of location.

The machinery, with the exception of one locomotive, is in good repair. The motive power consists of:

- 1 10 ton, six wheeled engine;
- 1 12 ton, eight wheeled engine;
- 2 13 ton, eight wheeled engine;
- 3 15 ton, six wheeled engine, (connected);
- 1 16 ton, eight wheeled engine, freight, (upon the track, but not in use.)

One six wheeled connected engine, and one eight wheeled passenger engine, are now on their way via New Orleans, and three more, one freight and two passenger engines, are under contract to be delivered in May. There will be required in addition, one freight, and one passenger engine.

## NUMBER OF CARS.

8 wheeled passenger cars.....	7
8 wheeled baggage cars.....	3
8 wheeled freight cars.....	42
4 wheeled freight cars.....	51

Contracts have been made for 35 eight wheeled cars in addition.

Number of miles run by passenger, freight and gravel trains during the year.....	103,950
Average cost per mile run, including current expenses for all purposes.....	62.3 cents.
Passengers carried for the year.....	54,265

Of this number, one lost his life in attempting to get on a train while it was in motion, at Milford, in December last. As far as is known no other passenger has received the slightest injury.

## RECEIPTS AND EXPENDITURES

On Account of Transportation, for the year ending 1st December, 1846.

For carrying passengers.....	\$51,190 11
For carrying freight.....	64,861 91
Total.....	\$116,052 02

## EXPENDITURES.

For renewing rails and ties on 10 miles of track, and the ordinary repairs on remainder of superstructure.....	\$10,960 04
For repairs of bridges.....	539 16
For repairs of road bed, ordinary and extraordinary.....	6,962 69
For repairs of cars.....	4,026 89
For repairs of locomotives.....	7,987 46
For repairs of machinery.....	227 87
For oil and tallow.....	1,204 86
For fuel.....	7,494 14
For rent.....	2,191 74
For loss and damage.....	658 82
For repairs of water stations.....	140 55
For transportation, expenditures, including wages, salaries, horse power, etc....	22,372 68
Total.....	\$64,766 90

## RECAPITULATION.

Total rec'ts on account of transportation.....	\$116,052 02
Total expenditure.....	64,766 90

Total over current expenses.....\$51,285 12

A Statement of the Amount Received each Month in the Year, for Carrying Passengers and Freight.

	Passengers.	Freight.
1845 December.....	\$3,618 76	\$4,261 07
1846 January.....	2,782 10	6,013 21
February.....	2,446 45	5,285 96
March.....	3,071 65	5,295 70
April.....	3,442 11	5,404 63
May.....	4,130 17	3,630 33
June.....	4,346 58	3,108 21

Live hogs.....	number 4,791

Two additional water stations have been erected on the lower part of the road during the past year, and the number will still require to be increased, in order to prevent, as far as possible, delay in bad weather. Some irregularities have occurred in the arrival of the mail during the latter part of the year, in consequence of the inefficient class of engines we have been obliged to employ, and the utter impossibility, with the small number in the possession of the company, of keeping them in working condition. The number and class of the locomotives ordered and on their way, for the use of the road, will furnish, it is presumed, an effectual remedy; and no doubt is entertained but that all just ground for complaint will be removed in a few weeks.

The time allowed by the card between Cincinnati and Springfield is five hours, forty minutes. This includes the delivery of the mail from the postoffice to the depot, and 1½ miles of horse power, and requires an average speed of 16 miles an hour, including stoppages after the locomotive is attached. This, it is believed, is as high a rate as a proper regard for the preservation of the road and machinery will permit.

The total length of the main track is 84 miles.

*A Statement of the Quantity and Average Cost of Earth Work and Masonry on the Little Miami Railroad, up to 1st December, 1846.*

Coal trans.—tons. 3,959		2,254	15,377

#### Miscellaneous Items.

A very extraordinary event has just taken place in the works connected with the Scottish Central railway. It was necessary to erect an embankment fifty feet high in a field near Allan bridge, where the railway was to pass. The work was accordingly commenced, and many thousand loads of earth were piled in the requisite place; the work was then left for the purpose of acquiring solidity, but upon visiting it again it was found to have disappeared with the exception of a few feet. On inquiry it was found that the field had originally been a bog, and the weight of the soil necessary to form the embankment had broken through the external solid earth.—*English paper.*

*The Coal Trade.*—The *Miners' Journal*, of Saturday last, published at Pottsville, Pa., says:

"With this week we close the coal trade of this region for the year 1846. In January last, the managers of the railroad company estimated the capacity of the road at 1,250,000 tons for the year—the quantity sent is 1,233,561 11 being only 16,438 09 tons less than the estimate. The estimate would have been exceeded if the trade had not been retarded in July by the passage of the new tariff bill, and the unusual and unexpected freshet which occurred in June.

The quantity sent to market from all the regions in 1846, is in round numbers 2,238,000 tons, against 2,053,633 tons in 1845, being an increase in 1846 of 312,000 tons.

*Erie Railroad Company.*—The *N. Y. Herald* says, that, on reference to the quotations of the old stock of the Erie Railroad Company, that there has been within the past week or two an advance of fourteen per cent. in the market value. This has been caused by the announcement that the board of directors had determined to pay interest on this stock, as soon as the road was completed to Binghamton. According to the existing appearance of the work on the road, it will be finished to that point in about two years. The directors do not say whether the payment of interest at that time will depend upon the income of the road, or whether it will be paid out of the new capital of the company, but we are informed that the intention is to pay the interest at any rate, whether there are any surplus receipts or not. When this road is completed to Binghamton, the three millions of dollars subscribed under the new charter, will be expended in interest and in constructing the road; the interest on which, at the rate of six per cent. per annum, will have to be paid, making an expenditure under this head of one hundred and eighty thousand dollars per annum. The par value of the old stock in the market is seven hundred and fifty thousand dollars, and the amount of bonds outstanding, about five hundred thousand more, making an aggregate of twelve hundred and fifty thousand dollars, the interest on which at six per cent. would be seventy-five thousand dollars per annum, making, with the interest on the \$3,000,000, an aggregate for interest alone of \$255,000 per annum.

*A Great Printing Machine.*—The *Brooklyn Eagle*, says, "the Messrs. Dryden, the celebrated English engineers, are employed in the construction of a printing machine for the *London Times*, to produce 12,000 impressions per hour, or the inconceivable number of upwards of three sheets per second!" and the *New York Sun* thinks that a machine will be produced in that city, capable of printing between fifteen and twenty thousand copies an hour. So do not we, notwithstanding the *Sun* says, that "good mechanics think it can be done." We do not believe it possible, because the sheets have to be separated and laid on the machine

singly by human hands—at least we have seen no machine where this labor has been otherwise performed—and we consider it utterly impossible that any man, whatever may be his dexterity, can separate and place on the machine three or four sheets per second. Nor do we think it likely that this duty will ever be discharged by mechanism. It has been tried by the most ingenious machinists in New York, but failed, because the operation requires mind.

*Improvements at Worcester.*—At a town meeting in Worcester, on Saturday, it was voted to allow the Boston and Worcester Railroad Corporation to close part of a street, in order to effect certain improvements, which are mentioned in the following, from the *Worcester Palladium*:—

"It is understood that all the railroad companies, now chartered here, will enter into the arrangement proposed by the Boston and Worcester Company; and that if they do so, that company will then go forward and make the proposed heavy expenditures; hold the property involved; and lease out depot accommodations to the other companies. The plan for the depot contemplates the erection of a substantial fire-proof building, 600 feet in length, and a part 80 feet, and other parts 100 feet in width; built upon a segment of a circle; with ample accommodations for the three roads now in operation, and the two others in progress; and admitting of an easy and ready passage of cars from any one to any other of the five. The great convenience of such an arrangement, for the public accommodation, cannot be over-estimated. Another part of the plan contemplates the concentration of the freight houses of all the roads near Washington Square, which, it is believed, will tend largely to a liberal growth of the town in that direction.

*Express Train to Utica.*—A *Rochester paper* says, "that the Utica and Schenectady Company intend in the spring to commence running an express train to Utica without stopping. If the rest of the companies come into this arrangement, Rochester will be reached in eight or ten hours, and Buffalo in twelve. The through mails can be sent by this train, and the business public will be greatly accommodated. The Tonawanda has already agreed to come into the arrangement; and it remains to be seen whether the rest of the roads will do likewise. The two central roads will endeavor to excuse themselves on the ground that their structures are too frail to allow a train to pass over at so rapid a rate. This may be the case; but they must re-construct their roads in a manner to meet the wants of the public, or witness a constant depreciation of their stocks, by the agitation of rival projects. When the southern line is finished, travel will seek that route, rather than run the risk of delays by taking the central line. We hope the arrangement proposed by the Utica road will meet with favor all along the line.

**Commerce of the New York Canals.**—A table of the commerce of the New York Canals for the last two years is published in the Albany Argus, which shows the following comparison:

From and to the Hudson River during the year 1845 and 1846, and the aggregate value of the property transported.

1845.	1846.
Tonnage, 1,428,956 tons.	1,601,335 tons.
Value, \$100,906,319	\$115,732,780

It will be seen that there is an increase in the tonnage of 172,579 tons, and of \$14,826,461 in the value of the property transported, and the excess both in tonnage and value over previous years is still greater.

The value of the entire movement of property from and to the Hudson, says the Argus, is greater by \$4,490,353 than the exports of the United States for the fiscal year ending July, 1844, and greater by \$7,297,845 than the value of the goods imported into the U. States for the same time.

**A Railroad from the Lakes to the Mississippi River.**—The citizens of Milwaukee are about to organize a Company to make a railroad from Milwaukee to the Mississippi. The country over which the road is to pass is said to be very favorable for the construction of a road, having but slight elevations, and but few rivers to cross. It would pass through a section of country illimitable in its agricultural resources, and which is now nearly worthless, for the want of a market for its products.

**Iron in Tennessee.**—The first iron manufactured in Tennessee, has been made at the Tennessee Valley Works, about fifty miles from the mouth of the Cumberland. The articles have been pronounced by competent judges, to be of very superior quality. These works have been built upon an enlarged scale, combining all the advantages such establishments can possess.

**Mining in New Jersey.**—Glowing statements of the copper mines at Flemington, New Jersey, have been recently given:

"From all that we can learn, the copper mines of Flemington, in Hunterdon County, are certain to be mines of wealth to the possessor. We understand that over twenty tons of the richest ore have been mined within the last three days. A specimen of the ore has been sent us by Mr. Whitaker, of this city, who received it from Gen. Hunt, one of the leading capitalists in this Company. It contains 50 per cent. of copper, is worth \$150 per ton at the mines. Mr. Whitaker tells us that the mining is done by contract at the rate of \$3 per ton. Besides this richest quality of ore, there is a kind which has a large admixture of rock and which affords only 20 per cent. of pure copper. Large quantities of this quality are also mined, and the prospects of the Company are certainly flattering in the extreme."—*Trenton News.*

**RAILWAY IRON.—THE BEST QUALITY** of English Heavy H Rails—60 lbs. to the yard—now in store, landing from the vessel, and on ship board to arrive, for sale on most favorable terms by  
DAVIS, BROOKS & CO.,  
Jan. 2 [14] 68 Broad St., New York.

**SPRING STEEL FOR LOCOMOTIVES,** Tenders and Cars. The Subscriber is engaged in manufacturing Spring Steel from 1½ to 6 inches in width, and of any thickness required: large quantities are yearly furnished for railroad purposes, and wherever used, its quality has been approved of. The establishment being large, can execute orders with great promptitude, at reasonable prices, and the quality warranted. Address

JOAN F. WINSLOW, Agent,  
Albany Iron and Nail Works,

**RAILROAD IRON.—THE NEW JERSEY** Iron Company, Boonton, N. J., are now preparing to make Railroad Bars, and are ready to take orders or make contracts for Rails, deliverable after the first of December next. Apply to

FULLER & BROWN, Agent,  
No. 139 Greenwich, corner of Cedar street.  
September 18, 1846. 10c39

**NICOLL'S PATENT SAFETY SWITCH** for Railroad Turnouts. This invention, for some time in successful operation on one of the principal railroads in the country, effectually prevents engines and their trains from running off the track at a switch, left wrong by accident or design.

It acts independently of the main track rails, being laid down, or removed, without cutting or displacing them.

It is never touched by passing trains, except when in use, preventing their running off the track. It is simple in its construction and operation, requiring only two Castings and two Rails; the latter, even if much worn or used, not objectionable.

Working Models of the Safety Switch may be seen at Messrs. Davenport and Bridges, Cambridgeport, Mass., and at the office of the Railroad Journal, New York.

Plans, Specifications, and all information obtained on application to the Subscriber, Inventor, and Patentee  
G. A. NICOLLS  
Reading, Pa.

**RAILROAD IRON.—THE SUBSCRIBER'S** New Rail Iron Mill at Phoenixville, Pa., is expected to be ready to go into operation by the 1st of September, and will be capable of turning out 30 to 40 tons of finished Rails per day. They are now prepared to receive orders to that extent, deliverable after the 1st of October next, for heavy rails of any pattern now in use, equal in quality and finish to best imported.

**PIG IRON**—They are also receiving weekly 150 to 200 tons of No. 1 Phoenix Foundry Iron, well adapted for light castings.

REEVES, BUCK & CO.,  
45 North Water St., Philadelphia,  
or by their Agent, ROBT. NICHOLS,  
79 Water St., New York

**THE SUBSCRIBERS, AGENTS FOR** the sale of  
Codorus,  
Glendon,  
Spring M.I. and  
Valley,  
Pig Iron.

Have now a supply, and respectfully solicit the patronage of persons engaged in the making of Machinery, for which purpose the above makes of Pig Iron are particularly adapted.

They are also sole Agents for Watson's celebrated Fire Bricks and prepared Kaolin or Fire Clay orders for which are promptly supplied.

SAM'L KIMBER, & CO.,  
59 North Wharves,  
Jan. 14, 1846. [1y4] Philadelphia, Pa.

**RAY'S EQUALIZING RAILWAY TRUCK.—THE SUBSCRIBER** having recently formed a business connection in the City of New

York, expressly for the manufacture of the newly patented and highly approved Railroad Truck of Mr. Fowler M. Ray, is ready to receive orders for building the same, from Railroad Companies and Car Builders in the United States, and elsewhere.

The above Truck has now been in use from one to two years on several roads a sufficient length of time to test its durability, and other good qualities, and to satisfy those who have used it, as may be seen by reference to the certificates which follow this notice.

There have been several improvements lately introduced upon the Truck, such as additional springs in the bolster of passenger cars, making them delightful riding cars—adapting it to tenders, trucks forward of the locomotive, and freight cars, which, with its original good qualities, make it in all respects the most desirable truck now offered to the public.

Orders for the above, will, for the present, be executed at the New York Serew Mill, corner 33d street and 3d avenue, (late P. Cooper's rolling mills) and at the Steam Engine Shop of T. F. Secor & Co., foot of 9th street, East

river, (of which firm the subscriber was late a partner) under the immediate supervision of Mr. Ray himself.

Several sets of trucks containing the latest improvements have recently been turned out for the New York and Erie railroad, and the New Jersey Transportation company, which may be seen upon said roads.

The patronage of Railroad Companies and Car Builders is respectfully solicited.

New York, May 4, 1846.

To all whom it may concern:—This is to certify that the New Haven, Hartford and Springfield railroad co., have had in use six sets of F. M. Ray's patent trucks for the last 20 months, during which time it appears to me, they have proved to be the best and most economical truck now in use.

[Signed,] WILLIAM ROE, Sup't of Power.  
I certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Philadelphia and Reading railroad for some time past, under a passenger car.

For simplicity of construction, economy in cost, lightness of material, and extreme ease of motion, I consider it the best truck we have ever used. Its peculiar make also renders it less liable to be thrown off the track, when passing over any obstruction. We intend using it extensively under the passenger and freight cars of the above road.

Reading, Pa., October 6, 1845. [Signed,] G. A. NICOLL,  
Sup't Transportation, etc., Philadelphia and Reading Railroad.

To all whom it may concern:—This is to certify that the N. Jersey Railroad and Transportation company have used Fowler M. Ray's Truck for the last seven months, during which time it has operated to our entire satisfaction. I have no hesitation in saying that it is the simplest and most economical truck now in use.

[Signed,] T. L. SMITH,  
Jersey City, November 4, 1845. N. Jersey Railroad and Transp. Co.  
This is to certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Long Island railroad for the last year, under a freight car.

For simplicity of construction, economy in cost, lightness of material and ease of motion, I consider it equal to any truck we have in use.

Long Island Railroad Depot, [Signed,] JOHN LEACH,  
Jamaica November 12, 1845. } 1y19 Sup't Motive Power.

**RICH & CO'S IMPROVED PATENT SALAMANDER SAFES.**

Warranted free from dampness, as well as fire and thief proof.

Particular attention is invited to the following certificates, which speak for themselves:

**TEST No. 10.**

*Certificate from Mr. Silas C. Field, of Vicksburgh, Mississippi.*

On the morning of the 14th ult., the store owned and occupied by me in this city, was, with its contents, entirely consumed by fire. My stock of goods consisted of oil, rosin, lard, pork, sugar, molasses, liquors, and other articles of a combustible nature, in the midst of which was one of Rich's Improved Patent Salamander Safes, which I purchased last October of Mr. Isaac Bridge, New Orleans, and which contained my books and papers. This safe was red hot, and did not cool sufficiently to be opened until 16 hours after it was taken from the ruins. At the expiration of that time it was unlocked, when its contents proved to be entirely uninjured, and not even discolored. I deem this test sufficient to show that the high reputation enjoyed by Rich's Safes is well merited.

S. C. FIELD.

**TEST No. 11.—Certificate.**

By the fire which occurred in this village on the 27th July last, our Law Office, together with many other buildings, was destroyed—we had in our office one of Rich's Improved Patent Salamander Safes, which, though heated red hot, preserved, without being the least damaged, many papers valuable to our clients—the envelopes of a few papers being slightly scorched. Some twenty-four hours after the fire, the Safe was removed, and so hot was it, that several hours were required for it to cool off. Our office was in the second story of a large brick building, all the wood used in construction of said house being pitch pine. While the Safe was red hot, one of the walls tumbled in, and so injured the lock that it was necessary to break the door open. From this test, we feel no hesitancy in recommending "Rich's Patent Salamander Safe" as *entirely fire proof.*

GOREE & KING.

Marion, Ala., Sept. 15th, 1846.

*Still other Tests in the Great Fire of July 19, 1845.*

The undersigned purchased of A. S. Martin, No. 138½ Water street, one of Rich's Improved Patent Salamander Safes, which was in our store, No. 54 Exchange place. The store was entirely consumed in the great conflagration on the morning of the 19th inst. The safe was taken from the ruins 52 hours after, and on opening it, the books and papers were found entirely uninjured by fire, and only slightly wet—the leather on some of the books was parched by the extreme heat.

RICHARDS & CRONKHITE.

Benton, Miss., December 27, 1845.

One of Rich's Improved Salamander Safes, which I purchased on the 2d of June last of A. S. Marvin, 138½ Water street, agent for the manufacturer, was exposed to the most intense heat during the late dreadful conflagration. The store which I occupied, No. 46 Broad street, was entirely consumed; the safe fell from the 2d story, about 15 feet, into the cellar, and remained there 14 hours, and when found, I am told, and from its appearance afterwards, should judge that it had been heated to a red heat. On opening it, the books and papers were found not to have been touched by fire. I deem this ordeal sufficient to confirm fully the reputation that Rich's safe has already obtained for preserving its contents against all hazards.

(Signed.)

WM. BLOODGOOD.

New York, 21st July, 1845.

Reference made to upwards of nine hundred and fifty merchants, cashiers, brokers, and officers of courts and counties, who have Rich's Safe's in use.

The above safes are finished in the neatest manner, and can be made to order at short notice, of any size and pattern, and fitted to contain plate, jewelry, etc. Prices from \$50 to \$500 each. For sale by

A. S. MARVIN, General Agent,

138½ Water st., N. Y.

Also by Isaac Bridge 76 Magazine street, New Orleans.

Also by Lewis M Hatch, 120 Meeting street Charleston, S. C.

16 11

**FRENCH AND BAIRD'S PATENT SPARK ARRESTER**

TO THOSE INTERESTED IN Railroads, Railroad Directors and Managers are respectfully invited to examine an improved SPARK ARRESTER, recently patented by the undersigned.

Our improved Spark Arresters have been extensively used during the last year on both passenger and freight engines, and have been brought to such a state of perfection that no annoyance from sparks or dust from the chimney of engines on which they are used is experienced.

These Arresters are constructed on an entirely different principle from any heretofore offered to the public. The form is such that a rotary motion is imparted to the heated air, smoke and sparks passing through the chimney, and by the centrifugal force thus acquired by the sparks and dust they are separated from the smoke and steam, and thrown into an outer chamber of the chimney through openings near its top, from whence they fall by their own gravity to the bottom of this chamber; the smoke and steam passing off at the top of the chimney, through a capacious and unobstructed passage, thus arresting the sparks without impairing the power of the engine by diminishing the draught or activity of the fire in the furnace.

These chimneys and arresters are simple, durable and neat in appearance. They are now in use on the following roads, to the managers and other officers of which we are at liberty to refer those who may desire to purchase or obtain further information in regard to their merits:

R. L. Stevens, President Camden and Amboy Railroad Company; Richard Peters, Superintendent Georgia Railroad, Augusta, Ga.; G. A. Nicolls, Superintendent Philadelphia, Reading and Pottsville Railroad, Reading, Pa.; W. E. Morris, President Philadelphia, Germantown and Norristown Railroad Company, Philadelphia; E. B. Dudley, President W. and R. Railroad Company, Wilmington, N. C.; Col. James Gadsden, President S. C. and C. Railroad Company, Charleston, S. C.; W. C. Walker, Agent Vicksburgh and Jackson Railroad, Vicksburgh, Miss.; R. S. Van Rensselaer, Engineer and Sup't Hartford and New Haven Railroad; W. R. M'Kee, Sup't Lexington and Ohio Railroad, Lexington, Ky.; T. L. Smith, Sup't New Jersey Railroad Trans. Co.; J. Elliott, Sup't Motive Power Philadelphia and Wilmington Railroad, Wilmington, Del.; J. O. Sterns, Sup't Elizabethtown and Somerville Railroad; R. R. Cuyler, President Central Railroad Company, Savannah, Ga.; J. D. Gray, Sup't Macon Railroad, Macon, Ga.; J. H. Cleveland, Sup't Southern Railroad, Monroe, Mich.; M. F. Chittenden, Sup't M. P. Central Railroad, Detroit, Mich.; G. B. Fisk, President Long Island Railroad, Brooklyn.

Orders for these Chimneys and Arresters, addressed to the subscribers, care Messrs. Baldwin & Whitney, of this city or to Hinkley & Drury, Boston, will be promptly executed.

FRENCH & BAIRD.

N. B.—The subscribers will dispose of single rights, or rights for one or more States, on reasonable terms.

Philadelphia, Pa., April 6, 1844.

•• The letters in the figures refer to the article given in the Journal of June, 1844.

ja45

**PATENT HAMMERED RAILROAD, SHIP and Boat Spikes.** The Albany Iron and Nail Works have always on hand, of their own manufacture, a large assortment of Railroad, Ship and Boat Spikes, from 2 to 12 inches in length, and of any form of head. From the excellence of the material always used in their manufacture, and their very general use for railroads and other purposes in this country, the manufacturers have no hesitation in warranting them fully equal to the best spikes in market, both as to quality and appearance. All orders addressed to the subscriber at the works, will be promptly executed.

JOHN F. WINSLOW, Agent.

Albany Iron and Nail Works, Troy, N. Y. The above spikes may be had at factory prices, of Erastus Corning & Co., Albany; Hart & Merritt, New York; J. H. Whitney, do.; E. J. Etting, Philadelphia; Wm. E. Coffin & Co. Boston.

ja45

**MACHINE WORKS OF ROGERS,** Ketchum & Grosvenor, Patterson, N. J. The undersigned receive orders for the following articles, manufactured by them of the most superior description in every particular. Their works being extensive and the number of hands employed being large, they are enabled to execute both large and small orders with promptness and despatch.

Railroad Work.

Locomotive steam engines and tenders; Driving and other locomotive wheels, axles, springs & flange tires; car wheels of cast iron, from a variety of patterns, and chills; car wheels of cast iron with wrought tires; axles of best American refined iron; springs; boxes and bolts for cars.

Cotton, Wool and Flax Machinery of all descriptions and of the most improved patterns, style and workmanship.

Mill gearing and Millwright work generally; hydraulic and other presses; press screws; callenders; lathes and tools of all kinds; iron and brass castings of all descriptions.

ROGERS, KETCHUM & GROSVENOR, a45 Paterson, N. J., or 60 Wall street, N. York.

**PATENT RAILROAD, SHIP AND BOAT Spikes.** The Troy Iron and Nail Factory keeps constantly for sale a very extensive assortment of Wrought Spikes and Nails, from 3 to 10 inches, manufactured by the subscriber's Patent Machinery, which after five years' successful operation, and now almost universal use in the United States (as well as England, where the subscriber obtained a patent) are found superior to any ever offered in market.

Railroad companies may be supplied with Spikes having countersink heads suitable to holes in iron rails, to any amount and on short notice. Almost all the railroads now in progress in the United States are fastened with Spikes made at the above named factory—for which purpose they are found invaluable, as their adhesion is more than double any common spikes made by the hammer.

All orders directed to the Agent, Troy, N. York will be punctually attended to.

HENRY BURDEN, Agent.

Spikes are kept for sale, at Factory Prices, by I. & J. Townsend, Albany, and the principal Iron merchants in Albany and Troy; J. I. Brower, 222 Water St., New York; A. M. Jones, Philadelphia; T. Janviers, Baltimore; Degrand & Smith, Boston.

•• Railroad Companies would do well to forward their orders as early as practicable, as the subscriber is desirous of extending the manufacturing so as to keep pace with the daily increasing demand.

ja45

**DAVENPORT & BRIDGES CONTINUE** to Manufacture to Order, at their Works, in Cambridgeport, Mass., Passenger and Freight Cars of every description, and of the most improved pattern. They also furnish Snow Ploughs and Chilled Wheels of any pattern and size. Forged Axles, Springs, Boxes and Bolts for Cars at the lowest prices. All orders punctually executed and forwarded to any part of the country.

Our Works are within fifteen minutes ride from State street, Boston—coaches pass every fifteen minutes.

1y1

## THE HERRON RAILWAY TRACK,

As seen stripped of the top ballasting

A GOLD MEDAL AWARDED THE INVENTOR BY THE AMERICAN INSTITUTE.

**THE UNDERSIGNED RESPECTFULLY** invites the attention of Engineers, and Railroad Companies, to some highly important improvements he has recently made in the Herron system of Railway structure. These improvements enable him to effect a very large reduction in the quantity of Timber, and cost of construction, without impairing the strength of the Track, or its powers of resisting frost, while they secure additional features of excellence in the Drainage and facility of making Repairs.

The above cut represents the "Herron Track" as it is laid on the Philadelphia and Reading, and on the Baltimore and Susquehanna Railroads. The intersection of the sills of the trellis are 5 feet from centre to centre, while in the new construction they are only 2½ feet. This renders the string piece unnecessary, thus removing the only objectionable feature found in the Track.

The result of experience has proved that all Tracks constructed with longitudinal timbers, such as mud sills, and more especially, the continuous bearing string pieces retain the rain water that falls between the Rails, which, being thus confined, settles along those timbers, and accumulating in quantity flows rapidly along them on the descending grades, washing out the earth from under the timber, and frequently causing large breaches in the embankments of the road. Whereas all water intercepted by the oblique sills of the trellis, is discharged immediately into the side ditches.

In the 5 foot plan, the Track occupies a Road bed nearly 11 feet wide, while the new construction takes

but 8 feet; the timber being more concentrated under the Rails. A block of hard wood, about 2 feet long and 15 inches wide, is introduced into a square of the trellis for the purpose of giving an additional, and effectual support to the joints of the Rails, which rest upon it. Should these joint blocks become chafed and worn by the working, and imbedding of the chairs, as is now the case on all Railroads, they can be readily replaced without any derangement of the timbers less liable to wear.

The following is a general estimate of its cost near the seaboard. In the interior it will be considerably less.

ESTIMATE OF THE PROBABLE COST OF ONE MILE.		
4,224 Timbers, 11 ft. long, 3 x 6 inches =	68,696 ft. b.m., at \$10 =	\$686 96
587 Oak joint blocks 2 ft. x 3 x 15 in. =	4,403 ft. b.m., at \$13 =	57 34
13,000 Spikes = 2,250 lbs. at 4½ cts =		101 25
Workmanship free of patent charge =		600 00

Cost of one mile including the laying of the Rail.....\$1,445 45

He has made other important improvements, which will be shown in properly proportioned models, that give a much better idea of the great strength of the Track than a drawing will do.

Sales of the Patent right to all the distant States will be made on liberal terms.

JAMES HERRON.

Civil Engineer and Patentee.

No. 277 South Tenth St., Philadelphia. 331f

# ENGLISH PATENT WIRE ROPES—FOR THE USE OF MINES, RAILWAYS, ETC.—

for sale or imported to order by the subscriber.

These Ropes are manufactured on an entirely different principle from any other, and are now almost exclusively used in the collieries and on the railways in Great Britain, where they are considered to be greatly superior to hempen ones, or iron chains, as regards safety, durability and economy. The plan upon which they are made effectually secures them from corrosion in the interior, as well as the exterior of the rope, and gives a greater compactness and elasticity than is found in any other manufacture.

Many of these ropes have been in constant operation in the different mines in England, and on the Blackwall and other inclined planes, for three and four years, and are still in good condition.

They have been applied to almost every purpose for which hempen ropes have been used—mines, heavy cranes, standing rigging, window cords, lightning conductors, signal halyards, tiller ropes, etc. Reference is made to the annexed statement for the relative strength and size. Testimonials from the most eminent engineers in England can be shown as to their efficiency, and any additional information required respecting the different descriptions and application will be given by

ALFRED L. KEMP,

75 Broad street, New York, sole agent in the United States.

Statement of Trial made at the Woolwich Royal Dock Yard, of the Patent Wire Ropes, as compared with Hempen Ropes and Iron Chains of the same strength.—October, 1841.

WIRE ROPES.			HEMPEN ROPES.			CHAINS.		STRENGTH
Wire gauge number.	Circumference of rope.	Weight per fathom.	Circumference of rope.	Weight per fathom.		Weight per fathom.	Diameter of iron.	
	INCH.	LBS. OZ.	INCH.	LBS. OZ.		LBS.	INCH.	Tons.
11	4½	13 5	10	24 -		50	15-16	20
13	3½	8 3	8½	16 -		27	11-16	13½
14	3½	6 11	7½	12 8		17	9-16	10½
15	2½	5 2	6½	9 4		13½	1-2	7½
16	2½	4 3	6	8 8		10½	7-16	7

N.B. The working load, with a perpendicular lift, may be taken at 6 cwt. for every lb. weight per fathom, so that a rope weighing 5 lbs. per fathom would safely lift 3360 lbs., and so on in proportion. 1y34

## AMERICAN RAILROAD JOURNAL.

OFFICE AT THE FRANKLIN HOUSE,  
105 Chestnut Street,  
PHILADELPHIA, PA.

This is the only periodical having a general circulation throughout the Union, in which all matters connected with public works can be brought to the notice of all persons in any way interested in these undertakings. Hence it offers peculiar advantages for advertising times of departure, rates of fare and freight, improvements in machinery, materials, as iron, timber, stone, cement, etc. It is also the best medium for advertising contracts, and placing the merits of new undertakings fairly before the public.

## BOSTON AND PROVIDENCE RAILROAD. Passenger Notice. Summer Arrangement. On and after Monday, Sept. 28, 1846, the Passenger Trains will run as follows:

For New York—Night Line, via Stonington. Leaves Boston every day, but Sunday, at 5 p.m. Accommodation Trains, leave Boston at 7½ a.m. and 3½ p.m., and Providence at 8 a.m. and 3½ p.m. Dedham trains, leave Boston at 9 a.m.; 3 p.m., 5½ p.m., and 10½ p.m. Leave Dedham at 8 a.m. and 4½ and 9 p.m. Stoughton trains, leave Boston at 11½ a.m. and 4-10 p.m. Leave Stoughton at 8 a.m. and 2½ p.m. All baggage at the risk of the owners thereof.

W. RAYMOND LEE, Sup't.

## BRANCH RAILROAD AND STAGES CONNECTING WITH THE BOSTON AND PROVIDENCE RAILROAD.

Stages connect with the Accommodation trains at the Foxboro' Station, to and from Woonsocket. At the Seekonk Station, to and from Lonsdale, R. I. via Pawtucket. At the Sharon Station, to and from Walpole, Mass. And at Dedham Village Station, to and from Medford, via Medway, Mass. At Providence, to and from Bristol, via Warren, R. I.—Taunton, New Bedford and Fall River cars run in connection with the accommodation trains.

## BOSTON AND MAINE RAILROAD.

Upper Route, Boston to Portland via, Reading, Andover, Haverhill, Exeter, Dover, Great Falls, South & North Berwick, Wells, Kennebunk and Saco.

Winter Arrangement, 1846-7.

On and after October 5th, 1846, Passenger Trains will leave daily, (Sundays excepted,) as follows:

Boston for Portland at 7½ a.m. and 2½ p.m. Boston for Great Falls at 7½ a.m., 2½ and 3-25 p.m.

Boston for Haverhill at 7½ and 11½ a.m., 2½, 3-25 and 5 p.m.

Boston for Reading at 7½ and 11½ a.m., 2½, 3-25 and 6½ p.m.

Portland for Boston at 7½ a.m., and 3 p.m.

Great Falls for Boston at 6½ and 9½ a.m., and 4½ p.m.

Haverhill for Boston at 7½, 8½, and 11 a.m. and 3 and 6½ p.m.

Reading for Boston at 7, 8½ and 9½ a.m., 12 m., 1½, 4 and 7½ p.m.

The Depot in Boston is on Haymarket Square.

Passengers are not allowed to carry Baggage above \$50 in value, and that personal Baggage, unless notice is given, and an extra amount paid, at the rate of the price of a Ticket for every \$500 additional value.

CHAS. MINOT, Sup't.

## THE BEST RAILROAD ROUTE TO THE

Lake and Buffalo, from Cincinnati.

Take Cars to Xenia, 65

miles; take Stage to Mansfield, 88 miles; thence by Cars to Sandusky, 56 miles to the Lake; thence Steamboat to Buffalo, 230 miles.

Fare from Cincinnati to Sandusky.....\$8 00

" " Sandusky to Buffalo, Cabin..... 6 00

" " " " Steerage..... 4 50

Fare by this route, although the cheapest across the state, will be reduced in a short time, railroad lengthened, and speed increased.

Leave Cincinnati in the morning, arrive at Columbus at night.

Leave Columbus in the morning, arrive at Sandusky same day.

Leave Sandusky, by Boat, in the morning, arrive at Buffalo next morning in time for the Cars north and east for Niagara Falls, Canada, Saratoga Springs, Troy, Albany, Boston, New York, Washington, or Philadelphia.

Passengers should not omit to pay their fare through from Cincinnati to Sandusky, or from Columbus to Sandusky via Mansfield; as this route is the only one that secures 56 miles [this road is run over in 2½. 50m.] most railroad which is new, and is the shortest, cheapest and most expeditious across the state.

Fares on the New York railroads are about to be reduced.

B. HIGGINS, Sup't, etc.

Sandusky, Ohio. M. & S. C. R. R. Co.

## SUMMER ARRANGEMENT.—NEW YORK

AND ERIE RAILROAD LINE, from April 1st until further notice, will

run daily (Sundays excepted) between the city of New York and Middletown, Goshen, and intermediate places, as follows:

FOR PASSENGERS—

Leave New York at 7 A. M. and 4 P. M.

" Middletown at 6½ A. M. and 5½ P. M.

FARE REDUCED TO \$1 25 to Middletown—way in proportion. Breakfast, supper and berths can be had on the steamboat.

FOR FREIGHT—

Leave New York at 5 P. M.

" Middletown at 12 M.

The names of the consignee and of the station where to be left, must be distinctly marked upon each article shipped. Freight not received after 5 P. M. in New York.

Apply to J. F. Clarkson, agent, at office corner of Duane and West sts. H. C. SEYMOUR, Sup't. March 25th, 1846.

Stages run daily from Middletown, on the arrival of the afternoon train, to Milford, Carbondale, Honesdale, Montrose, Towanda, Owego, and West; also to Monticello, Windsor, Binghamton, Ithaca, etc., etc. Agent on board. 13 u

## NORWICH AND WORCESTER RAILROAD.

Summer Arrangement, commencing

Monday, April 6, 1846.

Accommodation Trains, daily,

except Sunday. Leave Norwich, at 6 a.m., and 4½ p.m. Leave Worcester, at 10 a.m., and 4½ p.m.

The morning Accommodation Trains from Norwich, and from Worcester, connect with the trains of the Boston, and Worcester and Western railroads each way.

The Evening Accommodation Train from Worcester connects with the 1½ p.m. train from Boston.

New York Train via Long Island Railroad:

Leave Allyn's Point for Boston, about 1 p.m., daily, except Sunday.

Leave Worcester for New York, about 10 a.m., stopping at Webster, Danielsonville, and Norwich.

New York Train via Steamboat—Leave Norwich for Boston, every morning, except Monday, on the arrival of the steamboat from New York, stopping at Norwich and Danielsonville.

Leave Worcester for New York, upon the arrival of the train from Boston, at about 4½ p.m., daily, except Sunday, stopping at Webster, Danielsonville and Norwich.

Freight Trains daily each way, except Sunday.—Special contracts will be made for cargoes, or large quantities of freight, on application to the superintendent.

Fares are Less when paid for Tickets than when paid in the Cars. 5½

J. W. STOWELL, Sup't.

**TROY RAILROADS.—IMPORTANT NOTICE.**—Troy and Greenbush Railroad, forming a continuous track from Boston to Buffalo and Saratoga Springs.

This road is new, and laid with the heaviest iron H rail. Trains will always be run on this road connecting at Greenbush each way with the trains to and from Boston and intermediate places, leaving Greenbush daily at 1½ p.m. and 6 p.m., or on arrival of the trains from Boston; leave Troy at 7½ a.m. and 4½ p.m., or to connect with trains to Boston.

Trains also run hourly on this road between Troy and Albany. Running time between Greenbush and Troy, 15 minutes.

#### TROY AND SCHENECTADY RAILROAD.

This road is laid its entire length with the heaviest H rail—which is not the fact with the road from Albany. Trains will always be run on this road connecting each way, to and from Buffalo and intermediate places. Leave Troy for Buffalo at 7½ a.m. and 1 p.m. and 6½ p.m., or to connect with the trains for the west; leave Schenectady at 2½ a.m., 8½ a.m., 1 p.m. and 3½ p.m., or on arrival of the trains from Buffalo and intermediate places.

#### TROY AND SARATOGA RAILROAD.

##### THE ONLY DIRECT ROUTE.

No change of passenger, baggage or other cars on this route. Cars leave Troy for Ballston, Saratoga Springs, Lake George and White Hall at 7½ a.m., (arriving one hour in advance of the train from Albany,) and at 3½ p.m. Returning, leave Saratoga at 9 a.m. and 3½ p.m., (reaching Troy in time for the evening boats to New York.) Cars also leave Troy for the Burroughs at 3½ p.m. and 7 p.m., connecting with packet boats for the north. This takes passengers from New York and Boston to Montreal in 44 hours.

N.B. Travellers will find the routes through Troy most convenient and economical, and as expeditious as any other. The steamboats to and from New York land within a few steps of the railroad office, and passengers are taken up and landed by the different railroad lines at the doors of principal hotels, thus saving all necessity for, and annoyance from, hack drivers, cabmen, runners, etc.

Aug 3, 1846.

1y 32

#### BALTIMORE AND OHIO RAILROAD.

**MAIN STEM.** The Train carrying the Great Western Mail leaves Baltimore every morning at 7½ and

Cumberland at 8 o'clock, passing Ellicott's Mills, Frederick, Harpers Ferry, Martinsburgh and Hancock, connecting daily each way with the Washington Trains at the Relay House seven miles from Baltimore, with the Winchester Trains at Harpers Ferry—with the various railroad and steamboat lines between Baltimore and Philadelphia and with the lines of Post Coaches between Cumberland and Wheeling and the fine Steamboats on the Monongahela Slack Water between Brownsville and Pittsburgh. Time of arrival at both Cumberland and Baltimore 5½ P. M. Fare between those points \$7, and 4 cents per mile for less distances. Fare through to Wheeling \$11 and time about 36 hours, to Pittsburgh \$10, and time about 32 hours. Through tickets from Philadelphia to Wheeling \$13, to Pittsburgh \$13. Extra train daily except Sundays from Baltimore to Frederick at 4 P. M., and from Frederick to Baltimore at 8 A. M.

#### WASHINGTON BRANCH.

Daily trains at 9 A. M. and 5 P. M. and 12 a night from Baltimore and at 6 A. M. and 5½ P. M. from Washington, connecting daily with the line North, South and West, at Baltimore, Washington and the Relay house. Fare \$1 60 through between Baltimore and Washington, in either direction, 4 cents per mile for intermediate distances. (s13y)

**THE SUBSCRIBER IS PREPARED TO** execute at the Trenton Iron Works, orders for Railroad Iron of any required pattern, and warranted equal in every respect in point of quality to the best American or imported Rails. Also on hand and made to order, Bar Iron, Braziers' and Wire Rods, etc., etc.

PETER COOPER 17 Burling Slip.

1y 10

New York.

#### NEW RAILROAD ROUTE FROM BUFFALO TO CINCINNATI.

Passengers destined for Columbus and Cincinnati, O., Louisville, Ky., St. Louis, Mo., Memphis, Tenn., Vicksburg, Natchez, New Orleans, and all intermediate ports, will find a new, and the most expeditious and comfortable Route, by taking Steamboats at Buffalo, landing at Sandusky City, Ohio, distance 230 miles.

From thence by Cars, over the Mansfield Railroad which is new and just opened [laid with heavy iron,] to Mansfield, distance 56 " Thence by Stage via Columbus to Xenia over gravel and Macadamized Road, (the best in the state,) in new coaches, distance 88 " Thence, over the Little Miami Railroad, from Xenia to Cincinnati, distance 65 "

TIME. From Buffalo to Sandusky 24 hours. Leave Sandusky 5 a.m. to Columbus 14 " From Columbus to Cincinnati 15 " Or say 30 hours from Sandusky to Cincinnati over this route, including delays.

FARE. From Buffalo to Sandusky, Cabin \$6 00 " " " Steerage 3 00 " Sandusky to Columbus 4 50 " " through to Cincinnati 8 00

Passengers should not omit to pay their fare through from Sandusky City to Cincinnati and take receipts availing themselves of the benefit of a contract existing between the said Railroad and Stage Co's, securing 121 miles travel by good Railroad and 88 miles by Stage, in crossing from Lake Erie to the Ohio river, in the space of 30 hours.

Passengers destined for St. Louis, or any point below on the Mississippi, will save by taking this route, from 4 to 6 days time and travel, and nearly half the expense, over the Chicago and Peoria route to the above places.

Fare by this route, although the cheapest, will in a short time be reduced, Railroad lengthened, and speed increased.

B. HIGGINSON, Supt., etc.

M. & S. C. R. R. Co.

Sandusky City, Ohio.

#### NEW YORK & HARLEM RAILROAD CO.—Winter Arrangement.

On and after Monday, November 23, 1846, the cars will run as follows:

Leave 27th street for 42d street, Deaf and Dumb Institute, Yorkville, Harlem Morrianna, and Williams' Bridge, at 7 o'clock a.m. From City Hall for above named places, 2 p.m. [freight train,] 2 30 p.m. 5 p.m. to Morrisania only.

Leave City Hall for Harlem, Morrisania, Fordham and Williams' Bridge, at 7 45 a.m., and 10 45 a.m.; 1 15 p.m., 2 p.m. [freight train,] 2 30 p.m. and 3 45 p.m.

Leave City Hall for Hunt's Bridge, Bronx, Tuckahoe, Hart's Corners White Plains, Davis' Brook, Unionville and Pleasantville, [Pleasantville 4 miles from Sing Sing,] 7 45 and 10 45 a.m.; 1 15 p.m., 2 p.m. [freight train,] and 3 45 p.m.

##### RETURNING.

Leave Pleasantville, at 8, 10, [freight train,] and 11, a.m.; 1 30, and 4 p.m.

Leave White Plains, at 8 12, 10 30, [freight train] and 11 20 a.m.; 1 50, and 4 20 p.m.

Leave Tuckahoe, 8 35, 10 55, [freight train,] and 11 35, a.m.; 2 05, and 4 35, p.m.

Leave Williams' Bridge at 7 45, 8 50 and 11 50 a.m.; 2 50, 4, and 4 50 p.m.

Leave Morrisania 8 and 9 05 a.m.; 12 05, 2 35, 4 20, 5 05 and 6 p.m.

Leave Yorkville, at 8 12 a.m.; 4 35 and 6 15 p.m.

##### SUNDAY ARRANGEMENTS.

Leave City Hall for Pleasantville and intermediate places, at 7 45 a.m.; 1 15 and 3 p.m.

Leave Pleasantville for City Hall, at 8 a.m.; 11, and 3 15 p.m.

Leave City Hall for Williams' Bridge and intermediate places, 10 45 a.m.; 2 30 p.m.

Leave Williams' Bridge for City Hall, at 8 50 and 11 50 a.m.; 1, 3 45 and 4 45 p.m. 1y 49

#### BALTIMORE AND SUSQUEHANNA Railroad.—Reduction of Fare. Morning and Afternoon Trains between Baltimore and York.—The Passenger

trains run daily, except Sunday, as follows:

Leaves Baltimore at 9 a.m. and 3½ p.m. Arrives at 9 a.m. and 6½ p.m. Leaves York at 5 a.m. and 3 p.m. Arrives at 12½ p.m. and 8 p.m. Leaves York for Columbia at 1½ p.m. and 8 a.m. Leaves Columbia for York at 8 a.m. and 2 p.m.

##### FARE.

Fare to York \$1 50 " Wrightsville 2 00 " Columbia 2 12½

Way points in proportion.

#### PITTSBURG, GETTYSBURG AND HARRISBURG.

Through tickets to Pittsburg via stage to Harrisburg \$9 Or via Lancaster by railroad 10 Through tickets to Harrisburg or Gettysburg 3 In connection with the afternoon train at 3½ o'clock, a horse car is run to Green Spring and Owning's Mill, arriving at the Mills at 5½ p.m. Returning, leaves Owning's Mills at 7 a.m.

D. C. H. BORDLEY, Supt.

31 1y Ticket Office, 63 North st.

#### LEXINGTON AND OHIO RAILROAD.

Trains leave Lexington for Frankfort daily, at 5 o'clock a.m., and 2 p.m.

Trains leave Frankfort for Lexington daily, at 8 o'clock a.m. and 2 p.m. Distance, 36 miles. Fare \$1 25.

On Sunday but one train, 5 o'clock a.m. from Lexington, and 2 o'clock p.m. from Frankfort.

The winter arrangement (after 15th September to 15th March) is 6 o'clock a.m. from Lexington, and ma. 9. from Frankfort, other hours as above.

35 1y

#### SOUTH CAROLINA RAILROAD.—A Passenger Train runs daily from Charleston,

on the arrival of the boats from Wilmington, N. C., in connection with trains on the Georgia, and Western and Atlantic Railroads—and by stage lines and steamers connects with the Montgomery and West Point, and the Tusculum Railroad in N. Alabama. Fare through from Charleston to Montgomery daily \$26 50

Fare through from Charleston to Huntsville, Decatur and Tusculum 29 00

The South Carolina Railroad Co. engage to receive merchandise consigned to their order, and to forward the same to any point on their road; and to the different stations on the Georgia and Western and Atlantic railroad; and to Montgomery, Ala., by the West Point and Montgomery Railroad. 1y 25 JOHN KING, Jr, Agent.

#### CENTRAL RAILROAD-FROM SAVANNAH to Macon. Distance 190 miles.

This Road is open for the transportation of Passengers and Freight.

Rates of Passage, \$8 00. Freight—

On weight goods generally 50 cts. per hundred.

On measurement goods 13 cts. per cubic ft.

On brls. wet (except molasses and oil) \$1 50 per barrel.

On brls. dry (except lime) 80 cts. per barrel.

On iron in pigs or bars, castings for mills, and unboxed machinery 40 cts. per hundred.

On hhd's. and pipes of liquor, not over 130 gallons \$5 00 per hhd.

On molasses and oil \$6 00 per hhd.

Goods addressed to F. WINTER, Agent, forwarded free of commission. THOMAS PURSE, y 40 Gen'l. Supt. Transportation.

#### MANUFACTURE OF PATENT WIRE

Rope and Cables for Inclined Planes, Standing Ship Rigging, Mines, Cranes, Tillers etc., by JOHN A. ROEBLING, Civil Engineer, Pittsburgh, Pa.

These Ropes are in successful operation on the planes of the Portage Railroad in Pennsylvania on the Public Ships, on Ferries and in Mines. The first rope put upon Plane No. 3, Portage Railroad, has now run 4 seasons, and is still in good condition. 2y 19 1y

**CENTRAL AND MACON AND WESTERN** Railroads, Ga.—These Roads with the Western and Atlantic Railroad of the State of Georgia, form a continuous line from Savannah to Oothcaloga, Ga., of 371 miles, viz:

Savannah to Macon—Central Railroad ..... 190 Miles.  
Macon to Atlanta—Macon and Western ..... 101  
Atlanta to Oothcaloga—Western and Atlantic... 80  
Goods will be carried from Savannah to Atlanta and Oothcaloga, at the following rates, viz:

	To Atlanta	To Oothcaloga
On Weight Goods—Sugar, Coffee, Liquor, Bagging, Rope, Butter, Cheese, Tobacco, Leather, Hides, Cotton Yarns, Copper, Tin, Bar & Sheet Iron, Hollow Ware & Castings.....	\$0 50	\$0 75
Flour, Rice, Bacon in Casks or boxes, Pork, Beef, Fish, Lard, Tallow, Beeswax, Mill Gearing, Pig Iron and Grind Stones.....	0 50	0 62½
On Measurement Goods—Boxes of Hats, Bonnets and Furniture, per cubic foot.....	0 20	0 26
Boxes and Bales of Dry Goods, Saddlery, Glass, Paints, Drugs and Confectionary, per cubic foot.....	0 20	pr. 100 lbs. 35
Crockery, per cubic foot.....	0 15	" 35
Molasses and Oil, per bhd., (smaller casks in proportion).....	9 00	12 50
Ploughs, (large,) Cultivators, Corn Shellers, and Straw Cutters, each.....	1 25	1 50
Ploughs, (small,) and Wheelbarrows.....	0 80	1 05
Salt, per Liverpool Sack.....	0 70	0 95

Passage—Savannah to Atlanta, \$10; Children, under 12 years of age, half price, Savannah to Macon, \$7.  
Goods consigned to the subscriber will be forwarded free of Commissions.  
Freight may be paid at Savannah, Atlanta or Oothcaloga.

F. WINTER, Forwarding Agent, C. R. R.  
Savannah, Aug. 15th, 1846.

**GREAT SOUTHERN MAIL LINE! VIA** Washington city, Richmond, Petersburg, Weldon and Charleston, S. C., direct to New Orleans. The only Line which carries the Great Southern Mail, and Twenty-four Hours in advance of Bay Line, leaving Baltimore same day.

Passengers leaving New York at 4½ P.M., Philadelphia at 10 P.M., and Baltimore at 6½ A.M., proceed without delay at any point, by this line, reaching Richmond in eleven, Petersburg in thirteen and a half hours, and Charleston, S. C., in two days from Baltimore.

Fare from Baltimore to Charleston.....\$21 00  
" " " Richmond..... 6 00

For Tickets, or further information, apply at the Southern Ticket Office, adjoining the Washington Railroad Office, Pratt street, Baltimore, to STOKTON & FALLS, Agents.

**RAILROAD SCALES.—THE ATTENTION** of Railroad Companies is particularly requested to Ellicott's Scales, made for weighing loaded cars in trains, or singly, they have been the inventors, and the first to make platform scales in the United States; supposing that an experience of 20 years has given a knowledge and superior advantage in the business.

The levers of our scales are made of wrought iron, all the bearers and fulcrums are made of the best cast steel, laid on blocks of granite, extending across the pit, the upper part of the scale only being made of wood. E. Ellicott has made the largest Railroad Scale in the world, its extreme length was one hundred and twenty feet, capable of weighing ten loaded cars at a single draft. It was put on the Mine Hill and Schuylkill Haven Railroad.

We are prepared to make scales of any size to weigh from five pounds to two hundred tons.

ELLICOTT & ABBOTT.  
Factory, 9th street, near Coates, cor. Melon st.

**GEORGIA RAILROAD. FROM AUGUSTA TO ATLANTA—171 MILES.**  
AND WESTERN AND ATLANTIC RAILROAD FROM ATLANTA TO OOTHCALOGA, 80 MILES.

This Road in connection with the South Carolina Railroad and Western and Atlantic Railroad now forms a continuous line, 388 miles in length, from Charleston to Oothcaloga on the Oostenaula River, in Cass Co., Georgia.

## RATES OF FREIGHT.

	Between Augusta and Oothcaloga, 250 miles.	Between Charleston and Oothcaloga, 388 miles.
1st class. Boxes of Hats, Bonnets, and Furniture, per cubic foot.....	\$0 16	\$0 25
2d class. Boxes and Bales of Dry Goods, Saddlery, Glass, Paints, Drugs and Confectionary, per 100 lbs.	0 90	1 40
3d class. Sugar, Coffee, Liquor, Bagging, Rope, Cotton Yarns, Tobacco, Leather, Hides, Copper, Tin, Bar and Sheet Iron, Hollow Ware, Castings, Crockery, etc.	0 55	0 75
4th class. Flour, Rice, Bacon, Pork, Beef, Fish, Lard, Tallow, Beeswax, Feathers, Ginseng, Mill Gearing, Pig Iron, and Grindstones, etc.....	0 37½	0 62½
Cotton, per 100 lbs.....	0 45	0 65
Molasses, per hoghead.....	8 50	13 50
" " barrel.....	2 00	3 25
Salt per bushel.....	0 17	
Salt per Liverpool sack.....		95
Ploughs, Corn Shellers, Cultivators, Straw Cutters, Wheelbarrows.....	0 75	1 37

German or other emigrants, in lots of 20 or more, will be carried over the above roads at 2 cents per mile.

Goods consigned to S. C. Railroad Co. will be forwarded free of commissions. Freight may be paid at Augusta, Atlanta, or Oothcaloga.

J. EDGAR THOMSON,  
Ch. Eng. and Gen. Agent.  
Augusta, Sept. 2d, 1846.

**THE WESTERN AND ATLANTIC** Railroad.—This Road is now in operation to Oothcaloga, a distance of 80 miles, and connects daily (Sundays excepted) with the Georgia Railroad.

From Kingston, on this road, there is a tri-weekly line of stages, which leave on the arrival of the cars on Tuesday, Thursday and Saturday, for Warrenton, Huntsville, Decatur and Tusculumbia, Alabama, and Memphis, Tennessee.

On the same days, the stages leave Oothcaloga for Chattanooga, Jasper, Murfreesborough, Knoxville and Nashville, Tennessee.

This is the most expeditious route from the east to any of these places.

CHAS. F. M. GARNETT,  
Chief Engineer.  
Atlanta, Georgia, April 16th, 1846.

**TO RAILROAD COMPANIES AND MANUFACTURERS** of railroad Machinery. The subscribers have for sale Am. and English bar iron, of all sizes; English blister, cast, shear and spring steel; Juniata rods; car axles, made of double refined iron; sheet and boiler iron, cut to pattern; tiers for locomotive engines, and other railroad carriage wheels, made from common and double refined B. O. iron; the latter a very superior article. The tires are made by Messrs. Baldwin & Whitney, locomotive engine manufacturers of this city. Orders addressed to them, or to us, will be promptly executed.

When the exact diameter of the wheel is stated in the order, a fit to those wheels is guaranteed, saving to the purchaser the expense of turning them out inside.

THOMAS & EDMUND GEORGE,  
E. cor. 12th and Market sts., Philad., Pa.

445

**LITTLE MIAMI RAILROAD.—OPEN** TO SPRINGFIELD—Distance 84 miles—

connecting at Xenia and Springfield with Messrs. Neil, Moore, & Co's. daily daylight lines of stages going east and north, to Columbus, Zanesville, Wheeling, Cleveland, and Sandusky City, via Urbana, Bellefontaine, Kenton, and the Mad river and lake Erie railroad, or Columbus, Delaware, and the Mansfield and Sandusky City railroad—forming, by these connections, the cheapest and most expeditious route to Buffalo, Niagara Falls, Rochester, Albany, New York, and Boston.

On and after Thursday, August 13, 1846, until further notice, a Passenger train will run as follows: Leave Cincinnati daily at 9 A. M., for Milford, Foster's Crossing, Deerfield, Morrow, Fort Ancient, Freeport, Waynesville, Spring Valley, Xenia, Old Town, Yellow Springs, and Springfield.

Returning, will leave Springfield at 4 hours 35 minutes A. M. A line of Hacks runs in connection with the Cars, between Deerfield and Lebanon.

FARE—From Cincinnati to Lebanon....\$1 00  
" " " Xenia..... 1 50  
" " " Springfield... 2 00  
" " " Columbus... 4 00  
" " " Sandusky city 8 00

The Passenger trains runs in connection with Strader & Gorman's line of Mail Packets to Louisville.

Tickets can be procured at the Broadway Hotel, Dennison House, or at the Depot of the Company, on East Front street.

Further information and through tickets for the Stage lines, may be procured at P. Campbell, Agent on Front street, near Broadway.

The company, will not be responsible for baggage beyond 50 dollars in value, unless the same is returned to the conductor or agent, and freight paid at of a passage for every \$500 in value over that amount.

The 1½ P. M. train from Cincinnati, and the 2 40 P. M. train from Xenia, will be discontinued on and after Monday, the 10th instant.

A freight train will run daily.  
W. H. CLEMENT, Sup't.

**PHILADELPHIA, WILMINGTON & BALTIMORE RAILROAD.—1847.**

Winter Arrangement.

Philadelphia for Baltimore... 8 a.m. and 4 p.m.  
Baltimore for Philadelphia... 9 a.m. and 8 p.m.

Connecting in Baltimore with Mail Lines south and west, as per notice of the Baltimore and Ohio Railroad—and with Mail Lines north from Philadelphia, both morning and afternoon.

Sundays, the Morning Lines do not run in either direction.

Accommodation train from Wilmington to Philadelphia, leaves Wilmington at 8 a.m., and returns at 2 p.m.

J. R. TRIMBLE,  
Engineer and General Superintendent.

**LAWRENCE'S ROSENDALE HYDRAULIC** Cement. This cement is warranted equal to any manufactured in this country, and has been pronounced superior to Francis' "Roman." Its value for Aqueducts, Locks, Bridges, Floors and all Masonry exposed to dampness, is well known, as it sets immediately under water, and increases in solidity for years.

For sale in lots to suit purchasers, in tight paper barrels, by JOHN W. LAWRENCE,  
142 Front street, New York.

Orders for the above will be received and promptly attended to at this office.

**SPRING STEEL FOR LOCOMOTIVES,** Tenders and Cars. The Subscriber is engaged in manufacturing Spring Steel from 1½ to 6 inches in width, and of any thickness required: large quantities are yearly furnished for railroad purposes, and wherever used, its quality has been approved of. The establishment being large, can execute orders with great promptitude, at reasonable prices, and the quality warranted. Address

JOAN F. WINSLOW, Agent,  
Albany Iron and Nail Works,

1y

**VALUABLE PROPERTY ON THE MILL Dam For Sale.** A lot of land on Gravelly Point, so called, on the Mill Dam, in Roxbury, fronting on and east of Parker street, containing 63,197 square feet, with the following buildings thereon standing.

Main brick building, 120 feet long, by 46 ft wide, two stories high. A machine shop, 47x43 feet, with large engine, face, screw, and other lathes, suitable to do any kind of work.

Pattern shop, 35x32 ft. with lathes, work benches,

Work shop, 86x35 feet, on the same floor with the pattern shop.

Forge shop, 118 feet long by 44 feet wide on the ground floor, with two large water wheels, each 16 feet long, 9 ft diameter, with all the gearing, shafts, drums, pulleys, &c., large and small trip hammers, furnaces, forges, rolling mill, with large balance wheel and a large blowing apparatus for the foundry.

Foundry, at end of main brick building, 60x45½ feet two stories high, with a shed part 45½x20 feet, containing a large air furnace, cupola, crane and corn oven.

Store house—a range of buildings for storage, etc., 200 feet long by 30 wide.

Locomotive shop, adjoining main building, fronting on Parker street, 54x25 feet.

Also—A lot of land on the canal, west side of Parker st., containing 6000 feet, with the following buildings thereon standing:

Boiler house 50 feet long by 30 feet wide, two stories.

Blacksmith shop, 49 feet long by 20 feet wide.

For terms, apply to HENRY ANDREWS, 48 State st., or to CURTIS, LEAVENS & CO., 106 State st., Boston, or to A. & G. RALSTON & Co., Philadelphia. ja4

**TO RAILROAD COMPANIES AND BUILDERS OF MARINE AND LOCOMOTIVE ENGINES AND BOILERS.**

#### PASCAL IRON WORKS.

##### WELDED WROUGHT IRON TUBES

From 4 inches to 4 in calibre and 2 to 12 feet long, capable of sustaining pressure from 400 to 2500 lbs. per square inch. With Stop Cocks, T's, L's, and other fixtures to suit, fitting together, with screw joints, suitable for STEAM, WATER, GAS, and for LOCOMOTIVE and other STEAM BOILER FLUES.

Manufactured and for sale by  
**MORRIS, TASKER & MORRIS.**  
Warehouse E. E. Corner of Third & Walnut Streets,  
**PHILADELPHIA.**

**PATENT INDESTRUCTIBLE WATER**  
Pipes. The subscribers continue to manufacture the above Pipes, of all the sizes and strength required for City or Country use, and would invite individuals or companies to examine its merits.—This pipe, unlike cast iron and lead, imparts neither color, oxide or taste, being formed of strongly riveted sheet iron, and evenly lined on the inside with hydraulic cement. While in the process of laying, it has a thick covering externally of the same—thus forming nature's own conduit of stone. The iron being thoroughly enclosed on both sides with cement, precludes the possibility of rust or decay, and renders the pipe truly indestructible. The prices are less than those of iron or lead. We also manufacture Basins and D. Traps, for Water Closets, on a new principle, which we wish the public to examine at 112 Fulton street, New York.

28d J. BALL & CO.

**TO LOCOMOTIVE AND MARINE ENGINE BOILER BUILDERS.** Pascal Iron Works, Philadelphia. Welded Wrought Iron Flues, suitable for Locomotives, Marine and other Steam Engine Boilers, from 2 to 5 inches in diameter. Also, Pipes for Gas, Steam and other purposes; extra strong Tube for Hydraulic Presses; Hollow Pistons for Pumps of Steam Engines, etc. Manufacture: and for sale by

**MORRIS TASKER & MORRIS.**

Warehouse E. E. corner 3d and Walnut Sts., Philadelphia.

## NORRIS' LOCOMOTIVE WORKS.

BUSH HILL, PHILADELPHIA, Pennsylvania.

**MANUFACTURE** their Patent 6 Wheel Combined and 8 Wheel Locomotives of the following descriptions, viz:

Class	1,	15 inches	Diameter of	Cylinder,	×	20 inches	Stroke.
"	2,	14	"	"	×	24	"
"	3,	14½	"	"	×	20	"
"	4,	12½	"	"	×	20	"
"	5,	11½	"	"	×	20	"
"	6,	10½	"	"	×	18	"

With Wheels of any dimensions, with their Patent Arrangement for Variable Expansion. Castings of all kinds made to order: and they call attention to their Chilled Wheels, for the Trucks of Locomotives, Tenders and Cars.

**NORRIS, BROTHERS.**

**THE NEWCASTLE MANUFACTURING**  
Company continue to furnish at the Works, situated in the town of Newcastle, Del., Locomotive and other steam engines, Jack screws, Wrought iron work and Brass and Iron castings, of all kinds connected with Steamboats, Railroads, etc.; Mill Gearing of every description; Cast wheels (chilled) of any pattern and size, with Axles fitted, also with wrought tires, Springs, Boxes and bolts for Cars; Driving and other wheels for Locomotives.

The works being on an extensive scale, all orders will be executed with promptness and despatch. Communications addressed to Mr. William H. Dobbs, Superintendent, will meet with immediate attention.

ANDREW C. GRAY,  
President of the Newcastle Manuf. Co.

From the United States Gazette.  
The Central Railroad.

THOMAS P. COPE, ESQ.—Sir: The project of connecting the city of Philadelphia with her sister city of Pittsburg by railroad, being one of vast importance and of engrossing interest at this time, it becomes the duty of every one feeling an interest in the welfare of Philadelphia, to contribute all in his power to give confidence and success to the movement. The project of a subscription of \$2,500,000 on the part of the city, has been productive of various conflicting views, of which the public prints have been the constant vehicles for some time past.

Many—and these I think compose the greatest number of persons opposed to a subscription on the part of the city—are appalled at the magnitude of the undertaking, and the supposed enormous expense involved in its completion; whence arises the conviction, or at least the apprehension, that the work will never pay. That while the burden of expense will be borne by the city, its advantages will be general—the districts for instance, participating equally in them.

The Councils may reasonably be supposed to hesitate between their duty to promote the "trade and welfare" of the city, and a just regard for the number and respectability of those who hold these opinions. This being also the view, doubtless, of many capitalists and moneyed men, having reference to a supposed cost of from \$8,000,000 to \$10,000,000, a consequent apathy may be expected in coming forward to subscribe for the stock, especially if the number of those—and we know they will be numerous—who come forward through patriotic motives, should be unequal to the task.

We know there is abundant capital in Philadelphia; and if it can be shown that it will be a paying concern, patriotism will at once be stimulated in others, a great number of those who oppose the city subscription, would doubtless become reconciled to the measure, and complete and speedy success would crown the enterprise. If it can be made to appear, with a reasonable degree of certainty, that a railroad may be constructed from Harrisburg to Pittsburg for \$4,500,000, capable of accommodating all the business that may offer, with certainty and despatch, then it will require no farther proof that it will pay.

This is to be done by making available at a certain extent the works already forming the line of communication on that route. It is to this subject I would call your attention in this communication. It is a matter that has engaged my thoughts for some time.—While the subject was pending before the Legislature, and while legislative action might have been had in the matter, I prepared an article on the subject of making the present works available for the proposed railroad; but was deterred from submitting it to the public eye, lest to some the project might appear chimerical. But as farther reflection has but strengthened me in my convictions of its utility, I have ventured to call attention to the matter.

Of course the materials are not sufficient for an elaborate investigation of the plan.—Nothing but a careful investigation of all the circumstances based upon instrumental examinations of that portion of the public works proposed to be so used, can develop those.—But meagre as are the materials, I think it will not be difficult at least, to show that the matter is worthy of serious attention. The example of a railroad laid upon the banks of a canal is not wanting. We see an instance of it upon one of the banks of the Delaware and Raritan canal, which is occupied for some miles by the railroad line from Philadelphia to New York, via New Brunswick.

The distance from Harrisburg to Hollidaysburg by the line of the canal, is 145 miles, and the lockage or rise in that distance is about 620 feet—by other authorities less. This divided by the number of miles, gives not quite four and a half feet per mile, average. But the rise is more rapid as the canal approaches its termination at Hollidaysburg, being something like 450 feet in the last 38 miles which however is less than twelve feet per mile, average. I have made no allowance for any reduction of distance from that by the present line of improvements, by occasional deviations from the canal, where much saving could be effected in that particular, on which account I might fairly have deducted several miles. All who have travelled by the canal will have in recollection a point on the Eastern Division, where a walk of three-fourths of a mile over a ridge or spur, cuts off a detour by the canal of three miles—but this is a single instance.

A part of this plan is to lay down the railroad upon or the other bank of the canal, as circumstances at different points might make most desirable. It would be necessary to increase the towing path from ten feet, its present width, to that say of fifteen—for single track, which is, I believe, all that is contemplated at present. Culverts, etc., would require to be lengthened to correspond—that is, five feet.

Now let me endeavor to show the difference in cost between this plan and an independent line in the items of grading, culverts, drains, and the like. Take a single instance. An embankment 30 feet in height, 15 feet in width on top, and having the usual slopes of one and a half feet horizontal to one perpendicular, would be 105 feet at bottom, 15 feet at top—in place of an increased width of but five feet throughout; involving, as a few figures would show, but one-twelfth the labor and expense. The same applies to excavations. To adapt a culvert under such circumstances to the increased width, would cost but one-twentieth, there being but five feet in length to construct instead of, say, 100. A person not familiar with the subject, might at the first blush of the matter, conclude that the additional cost would be exactly in proportion to the increased width.

It is true, that I have perhaps, assumed an extreme case—but one that would frequently occur however—for the discrepancy would not be so great between the increased width and cost, if the excavation or embankment

was but five feet. But we see at least, that so to enlarge the cuttings and embankments of the canal, as to obtain a roadway of 15 feet, could never cost more than one-third of what would be the expenditure to obtain the same dimensions in a separate work; for where the cuttings and embankments were but one foot, this would be nearly the case—and varying from that to one-twelfth, as I have shown where the cuttings and embankments are thirty feet. An allowance for constructing the horse path, where occupied by the railroad, will be hereafter spoken of.

But let us proceed cautiously. We will therefore assume that the grading would cost one-third of what would be the expense of an independent line, including viaducts, culverts, etc., under the head of grading. This ration of expense is particularly applicable, it is believed, to adapting the aqueducts (of which there are 49 upon the two divisions of the canal) to the double purpose; especially as it is possible that the railroad might be passed upon a second story, as is the case with the railroad over the Raritan at New Brunswick. We will put the cost of an independent line at \$30,000 per mile, which is thought to be a fair estimate, for all but the Allegheny Division, where this plan proposes the use of the Portage railroad. It is about the average cost of well constructed railroads in this country, including equipments. If of this sum we set aside \$3000 per mile for the equipments, such as cars, locomotives, depots, water stations, etc., we have \$27,000 per mile for the construction of the road proper. We will set aside \$8000 of this for the superstructure—single track—which will equip the road with a T rail weighing 56 pounds per yard, we have \$19,000 per mile left for grading. Now if we assume that a road bed may be graded and prepared along the banks of canal for one-third of the cost of an independent line, as I have endeavored to show we may, then we require for this purpose \$6333 per mile. Add to this \$8000 per mile for superstructure, and \$3000 per mile for equipments, and we have \$17,333 per mile, total expense. The distance from Harrisburg to Hollidaysburg being 145 miles, we have as total cost of this link in the chain, £2513,295.

In these estimates I have taken no notice of the fact, and a very important one it is, that the land damages or "right of way" amounting in England—I state it as a curious fact—to \$20,000 per mile, or equal to the entire cost of many of our railroads, would cost a mere trifle; as the line of railroad might, I doubt not, be almost entirely laid within the limits to which the titles have been extinguished by the state, for the purposes of the canal. Under other circumstances, this item, including fencing, could not be put at less than \$1500 per mile. Neither have I taken any notice of the fact that there would be little or no clearing and grubbing, usually amounting from \$300 to \$500 per mile.

I might also urge the facilities which the canal would afford in the construction of the railroad.

I will offset these against the construction

of the horse or towing path, at such points as would require it. On embankments this would be unnecessary, as it is already provided in the "heel path."

I do not know whether the same plan is applicable to the western division of the canal, extending from Johnstown to Pittsburg, since it would appear, that by deviating considerably from the line of the canal the distance may be very much curtailed. However, I shall assume for the present purpose that it is, and will endeavor to show at all events, that by adhering to it, a railroad communication may be had with Pittsburg at a very small cost—making the Portage railroad also a link in the chain, as before mentioned.—From Johnstown to Pittsburg the distance by the canal is 104 miles, and the lockage, or descent, 471 feet, or four and one-half feet per mile average, the descent of course being more rapid near Johnstown, but still such as to admit of extremely easy grades.

And here I will take occasion to say in regard to both divisions of the canal, that the lockages usually occur singly—the locks being seldom nearer each other than from a third to a half a mile. If we assume a maximum grade of 45 feet per mile, and put down the average rise at each lock at eight feet, then we would require a plane of but one-sixth of a mile at each lock to overcome the ascent; and the balance would be upon the present level grade on the towing path. And as 14 miles at 45 feet per mile, will overcome the whole ascent between Harrisburg and Hollidaysburg, and as 11 miles at 45 feet per mile will overcome the whole ascent from Pittsburg to Johnstown, it follows, that with the exception of these 25 miles, the whole remainder, consisting of 224 miles, might be upon a dead level. This is an answer to any objections, that might arise to the short curvatures occasionally occurring on the canal, as they could be made to fall upon level grades. Besides, the Columbia railroad presents instances of as sharp curves as occur upon the canal, if I mistake not, viz: a radius, of 350 feet. There are curves of 822 feet radius, which occupy 12 miles in length of that work.

The distance from Johnstown to Pittsburg being 104 miles, as before stated, at \$17,338 per mile, gives us the sum of \$1,802,632, which add to \$2,513,295, and we have \$4,315,927, as the cost of the whole improvement, including cars, locomotives, depots, etc. provided we make use of the Portage railroad, at least for some years. Now let us see why this may not be done.

The Portage railroad is 37 miles in length. The rise from Hollidaysburg to the summit, is 1398 feet, distance 10 miles; and the descent from the summit to Johnstown, is 1171 feet, distance 27 miles. This trip is performed in about four hours, or at the average speed of about nine miles per hour, which is six miles less per hour than the ordinary speed of passenger trains upon the railroads of this country. Now it might well be questioned, whether, if the 2569 feet of rise and fall between Hollidaysburg and Johnstown, could be spread out so as to occupy 39 miles,

at 66 feet per mile—being the grade which the Baltimore and Ohio railroad will have for about that number of miles, if ever completed to the Ohio, as I understand—this would not offer almost as great an obstacle, especially to its freighting business, as in its present shape; when we take into account that as an equivalent for this, we have light grades for the remainder of the distance, and even 224 miles of perfect level.

Now let us look at the amount of business which the Portage railroad can accommodate. Not having by me any information of a late date, I am compelled to consult a report made in 1838, in which this matter is alluded to. It is to be presumed that its capabilities have not diminished since that period—on the contrary we know, that within the last few years, great improvements have been made in the working of inclined planes, both as regards its speed and safety. In this report it is stated, that four cars carrying two and a half tons each, may ascend together; that an equal number may be let down at the same time, and that from six to ten of these trips may be made per hour. Four cars each way, with two and a half tons each, gives 20 tons per trip. Now assuming the smallest number of trips per hour, viz: six, we have 120 tons as the business which may pass a given point in one hour; and 1440 as a day's work, or 864,000 tons, working the road day and night.

Since writing the above, the report of the Canal Commissioners for 1836 has met my eye, from which I extract the following, by which it will be seen that I have underrated, rather than overrated, the capacity of the Portage railroad.

"The Portage railway, however complicated in its operations, is, nevertheless, adequate to the transaction of a vast amount of business. Occupying as it does, nearly a central position on the main line between Columbia and Pittsburg, the capacity of the planes ought to be equal to that of the canal locks, the latter, we know, have never had a demand upon them equal to one-fifth of their capacity on those divisions. Many suppose the planes fall very far short of that limit, and that their full capacity is nearly reached.

"It is however due to our commercial interests and the public at large to state, that the maximum of that limit is very far from being attained. The length of the longest plane is about 3000 feet; the time occupied in moving up or down it, is five minutes, the time occupied in attaching is two and a half minutes, making seven and a half minutes, or eight drafts per hour of three loaded cars, carrying three tons each, making 24 cars, or 72 tons per hour each way," which is equal to 518,400 tons per annum.

"It will be observed by the report of the Superintendent, that the number of cars weighed at Hollidaysburg, and transported from east to west, from April 1st, to October 31st, is 14,800, making a transit of a number not exceeding a hundred per day, but when the business requires it, instead of this number 24 cars can be passed up and the same number down the longest plane in each hour,

making 288 cars in the day of 12 hours, or 576 in one direction in 24 hours; this can be accomplished by using the road day and night, by means of a double set of hands.—This is the true limit of the capacity of the road," viz: 1,036,800 per annum, which approaches the immense tonnage of the Reading railroad.

If we compare this capacity for business with the amount done on the principal freighting railroads of the country, how far it outstrips them. Take the Western railroad, between Boston and Albany, for instance, which in 1844 transported 71,000 tons.

Under these circumstances, why should not the Portage become a link in the chain? Since we find that it can do all that is required of it, and save a heavy outlay that might jeopard the undertaking. Should the project of using the canal banks not meet with the favor I anticipate for it, from any cause, I am confident I shall not be disappointed as to the approbation this part of the plan will meet with, under the state of facts I have shown to exist. It is this portion of the improvement—the passage of the Allegheny mountain, that "so affrights men's souls."—Let it be known that the Portage railroad can be safely made available for this purpose, and much of the difficulty vanishes.

It is not to be presumed there would be any difficulty in effecting the amendments in the charter which this plan, or any portion of it, might make necessary; when we consider the revenue that would flow into the treasury, by its adoption. Indeed, if the route by the Juniata should be adopted, it may be worth considering, whether that instrument will not require some amendment, at all events—as the railroad will doubtless require to cross and re-cross the canal frequently, and often run parallel and near to it—to prevent collision between the two interests; which may happen if the rights of both are not clearly pointed out and defined.

As to the expense of working and maintaining the Portage railroad, it appears from the report of the Canal Commissioners, that for the year ending December 1st, 1844, the motive power, trucks, and maintenance of way of the Portage railroad, cost \$135,000; and that the same distance on the Columbia road cost for the same purposes, \$90,187, or but about one-third less.

The following additional statistics of the Portage railroad may be interesting.

The Portage railroad cost about \$2,000,000, or \$54,000 per mile; from this may be inferred the cost of constructing a railroad through this region with easy grades, and without the facility of adapting itself, like that work, to the inequalities of the ground. There are upon the line four viaducts, one of which is 70 feet high, and cost \$54,000; one tunnel 900 feet long, 69 culverts, and 85 drains.—There are 10 planes, five on each side of the summit, with two stationary engines at each; but one however is used at a time, the other being kept as a relay. The height of the summit above the ocean is 2491 feet.

I will close this communication with the following deduction (in part) from the pre-

mises I have taken. If we call the investment in round numbers \$4,500,000; and if we assume a number equal to 150,000 through passengers, at \$4; and 150,000 tons of freight at \$6, to say nothing of mail service, etc., we have the following items:

150,000 passengers, at \$4.....	\$600,000
150,000 tons freight, at \$6.....	900,000

Total.....	1,500,000
Deduct as the State's pro rata.....	300,000

Balance.....	1,200,000
Deduct 50 per cent. for expenses.....	600,000

Total net.....	\$600,000
----------------	-----------

Which is equal to over 13 per cent. on the capital.

The following, which has just come under my notice, as it appears pertinent to the subject, I append. It may be well to add, that the work spoken of is now progressing. "I will also remark that the idea of so appropriating the banks of the canal, was suggested by your correspondent in an article published in the Railroad Journal five years since, with details of the plan and estimates; but the limited means of the company prevented its adoption at that time."

"The New Haven and Northampton canal company have had it in contemplation for some time, and are now concerting measures for an increase of capital to enable them to lay down a railroad on their towing path from New Haven to Westfield and Northampton, 80 miles, and thus bring the travel and transportation of the populous and thriving valley of the Connecticut to New York, by way of New Haven, using both the canal and railroad. The whole length being already graded with the exception of some slight additions about the locks, with the advantage of a canal to transport all the materials for the superstructure, it has been ascertained that the whole can be done with the heaviest T rail for about \$7000 per mile—say \$560,000 for 80 miles! Then it will be tested which road can best afford to carry for low fare, the one that costs only \$560,000, or the one that has cost, or will cost, when completed, one or two millions of dollars! Many persons now express their surprise that the canal company, or the New Haven people, did not sooner avail themselves of the already graded banks of the canal for this purpose."

I am, with great respect, your obedient servant,  
FRANKLIN P. HOLCOMB.

#### New York and Erie Railroad.

We have received the following call upon, and statement to, the shareholders of this road. In giving place to this communication, we cannot refrain from the free expression of our opinion of the efforts and deserts of the directors and officers of this company. Coming into this place, and the management of its affairs, as they did, when its sun of prosperity was under an almost total eclipse, and bringing it, as they have, into a state of prosperity and active progression, they merit—and if the people of New York, and the Southern tier of counties, and the West can appreciate a generous devotion to the public interest—they will receive rich rewards in a just estimation of their labors.

It is no new thing for us to say that, to the city of New York, it would be true economy—could it not

be otherwise built—to build it by a tax upon the property of the city—rather than not to have it done; but, by the energy and perseverance of those who have had its direction during the two past years, doubts have been dispelled, and renewed confidence inspired in the minds of those who are to be benefited by its early completion; and we desire again to bear our testimony warmly in favor of, and to cheer on, those who deserve so much from their fellow citizens. The call referred to is as follows, and we trust it will meet with a prompt response from all to whom it is addressed.

*"The Stockholders of the New York and Erie Railroad Company are hereby notified that an instalment of ten dollars per share on all shares on which the payments already made do not exceed twenty-five dollars, is required to be paid at the office of the company, No. 45 Wall street, on or before the 12th day of January, 1847.*

*By order of the Board of Directors.*

*NATHANIEL MARSH, Secretary.*

*"N. B.—Subscribers at or near Newburgh, are requested to make payments to Thomas C. Ring, Esq., Cashier of the Powell Bank.*

"The above is a copy of a call for a further instalment of ten per cent. And in making this call, the Board of Directors have considered it due to the Stockholders that they should be kept fully advised of the condition and prospects of the Company, and to that end submit the following:—

"All the preceding calls made by the Directors have been very generally responded to by the subscribers, and 25 per cent has been paid on an amount beyond 3,000,000 dollars; a considerable number have paid a much larger per centage in advance, and many have paid up in full.—

"The interest on the instalments, and on all other indebtedness of the Company, has been paid semi-annually, agreeably to the terms of subscription; and in accordance with the views set forth in the address of the Directors, at the time of opening the Books for subscription on the 1st September, 1845, it has been paid out of the net earnings of the road, leaving a surplus to carry to next year's interest account.

"From 9 to 10 miles of as heavy and expensive a portion of the work as any of like distance to Lake Erie, (viz: from Middletown to Otisville,) was added to the main line in the month of October last. The grading from that point to Binghamton, a distance of over 140 miles, has been put under contract on very favorable terms, and much below the Engineer's estimate, and will be finished during the ensuing year. The contractors are now at work on the heaviest and most difficult parts of the line, both in our own State and in Pennsylvania, and the whole work will be urged forward as rapidly as a proper regard to economy and prudence will permit; the Directors hoping to be able to extend the road to Hornellsville, nearly simultaneously with its completion to Binghamton, or at the farthest, by the 1st January, 1849—or within two years from date.

"A contract for all the iron rails required for the whole distance to the place last named, has also been made on very advantageous terms.

"The Stockholders having been heretofore informed of the reasons which have delayed a more rapid prosecution of the work, it may suffice at this time to state that the whole line from Otisville to Binghamton, a distance of 140 miles, was for a long time under the control of the Commissioners, until by their recent decision in favor of the best route to Lake Erie, they have settled a very important question which has embarrassed the company for years.

"By this decision a most favorable line has been obtained, in addition to which the Directors have determined to alter and improve the grade beyond Binghamton, at the few points where it is required, which is considered by the Engineers perfectly practicable, and at very little expense; when the grade or line will stand thus:—From Dunkirk on Lake Erie, coming east towards the Hudson River, for the first 14 miles, the maximum grade will not exceed 60 feet to the mile;—from that point to Hornellsville, a distance of 114 miles, the grade will not exceed 30 feet to the mile;—from Hornellsville to Port Jervis, 250 miles, the whole distance is level, descending, or not exceeding five feet to the mile, except at one point, where an ascending grade of 60 feet to the mile is met with for a distance of 8 miles, being the high land between the Susquehanna and Delaware Rivers; at which point a heavy train of cars would require an extra or assisting engine, with which assistance a continuous line of 250 miles would be rendered practically level. From Port Jervis, ascending the Shawangunk mountain to Otisville, a distance of 11 miles, the grade is but 45 feet to the mile. With the road now in use from Otisville, (the present terminus) to Piermont, a distance of 62 miles, the Stockholders are doubtless generally familiar.

"Thus it will be seen that a better grade has been obtained for this great work than its most sanguine friends ever anticipated, the value and importance of which to this city and the southwestern counties of our State, can hardly be estimated, and can only be measured by millions of dollars, when the business of a series of years is taken into account.

"It is further believed that if anything can compensate the people of the Southwestern counties, and those also of our own city, for the great injury they have sustained by the long delay in the construction of this important work, it will be found in the improved character of the line above referred to.

"At the time of opening the Books for subscription, the Directors deemed it expedient, if not absolutely necessary to success, that interest should be paid on the new subscriptions, believing that the net earnings of the road would provide for such payment, leaving the subject of paying interest on the old stock an open question. Since which time unceasing complaints have been made,

and much dissatisfaction expressed at the Directors declining to pay interest on the old stock. The consideration of the question having been postponed as long as a proper and prudent regard for the true interests of the company would permit, the subject was recently taken up by the Board, and after a very full and careful examination, it was determined to pay interest on the old stock from the date of completion of the road to Banghamton, and upon the same principle, that it was determined to pay interest on the new subscriptions, viz: out of the net earnings of the road, believing that when the road shall be extended to that point, that the net earnings will provide for the interest on both classes of stock; in which case they consider they would have no right to withhold it. If the limits assigned to this circular would allow a full statement of all the reasons which influenced the Board in such determination, it is believed their decision would meet the approbation of every Stockholder in the Company.

"The earnings of the road are steadily and permanently increasing, and every additional portion added to the main line, lessens the active competition between it and the Hudson river, from which, as it will be seen by reference to the map, it very gradually diverges from its commencement at Piermont to Middletown; but from which latter point westward, there will be little or no competition for the trade of the South-western Counties of our own State, and also that of all the Northern tier of Counties of Pennsylvania, extending on a line parallel with the road, a distance of nearly 400 miles, and which, by their position, will necessarily be dependent on this road for a communication with this city, and without taking into account the business of the rapidly extending West, with its great inland seas, it is difficult to conceive with an outspread map before us, of any portion of our country through which a railroad could be constructed which would draw to it the trade of such an extensive and valuable portion of the country, and so abundant in resources and substantial wealth.

"It may not be improper here to add, that from the time the present Board of Directors assumed the control of this work, they have disincumbered it of a vast amount of difficulties and embarrassments, and placed it in a condition to deserve, as they believe, the entire confidence of the Stockholders and the public; and when it is further considered (and it will bear repetition), that in addition to the great natural advantages of this work, is added the release of the State lien of \$3,000,000, and the reduction of the old stock to half its par value, thus forming a bonus of more than thirty per cent. on all the stock of the Company, it is doubtless safe to state that no railroad stock of our country ever presented, or will be likely hereafter to present, greater inducements for a safe and permanent investment.

"By order of the Board of Directors.

NATHANIEL MARSH,  
Secretary."

New York, January, 1847.

#### The Railroad Interest in Maine.

The accounts from the state of Maine, give evidence of a lively interest being exhibited in that quarter, in regard to railroads. The citizens of Bath, Augusta, Gardiner, Hallowell, etc., are up and doing—and the prospect is, that important results will be accomplished—if the spirit shown at the late public meetings, can be taken as an earnest of the disposition of the people there. We learn from the "Yankee Blade," that a great mass meeting of the citizens of Hallowell, Augusta and Gardiner, was held at the town hall in the first named town, on Saturday last, for the purpose of taking more active and energetic measures in regard to the Portland and Kennebec railroad. The people turned out in great numbers; both in the forenoon and afternoon, and eloquent and enthusiastic speeches were delivered, which were listened to with the deepest interest. Among those who addressed the meeting were Rev. J. W. Bardbury, Hon. Renel Williams, Hon. David Bronson, and Rev. W. A. Drew, of Augusta, Hon. John Otis, of Hallowell, and R. H. Gardiner, and Park Sheldon, Esq., of Gardiner. A degree of zeal, spirit, unanimity and enthusiasm was exhibited, such as has never before been witnessed among us, and on all hands there was felt to be an absolute necessity of adopting the most vigorous measures, and that—*immediately!*—Mr. Otis, "one of the directors of the railroad, reported that the aggregate subscriptions for the road, now on the books, amounted to \$478,000—and that, in all probability, the amount would soon be raised to \$800,000. The following strong resolutions were passed. It will be seen by the last particularly that the people are wide awake for the enterprise, and are determined that its prosecution shall lag no longer.

This is managing matters in the right spirit. A series of resolution were proposed and adopted—from which we cull the following as specimens:—

*Resolved*, That the time has arrived when the public interest demands the opening of a grand channel of railroad communication, connecting the valleys of the Kennebec and the Penobscot with Portland and Boston; and that it is the sense of this meeting that such road should pass through Brunswick, Gardiner, Hallowell, and Augusta, to such point on the Kennebec river, in Waterville or Fairfield, as shall best secure the public accommodation, and the facilities of crossing the Kennebec in its extension to Bangor.

*Resolved*, That we regard this road as the commencement of a system of railroads, running far up the valley of the Kennebec, and connecting with Bangor, branching off at various points, so as to accommodate every part of the interiors of the counties of Kennebec, Franklin, Somerset and Penobscot, developing the resources, and increasing the wealth of the country through which it shall pass.

*Resolved*, That the subscriptions already obtained to the Kennebec and Portland railroad, together with the sums pledged to be taken and in a short time to be realized, do, in the opinion of this meeting, fully authorize the directors to take immediate steps to put the whole line under contract to Augusta, with the branch to Bath.

*Resolved*, That the towns of Augusta, Hallowell, Gardiner, Bath, and Brunswick, have the ability to invest at least \$800,000 in the road, and that the interests of those towns imperiously demand that it be done.

Railroad meetings appear to be the order of the day in every direction, in that region, and the disposition appears to be to push matters on with vigor. The Skowhegan Press says that subscription papers are in circulation, for subscribers to the stock in the Waterville and Lewiston road, and something like \$5000 have been taken by individuals in the two villages of Skowhegan and Bloomfield.

The residents along the proposed routes from Portland, eastward, are actively engaged in pressing the

subject upon the people generally, and we are happy to see that it has excited a deep interest among all classes there—the merchant, the manufacturer and the farmer, as well as the capitalist.

#### Wolfe Island, Kingston, and Toronto Railroad.

The Kingston (U. C.) Gazette says, "it will be remembered that a few months ago, our talented and respected fellow townsman, Charles Stuart, Esq., proceeded to England on behalf of the acting committee of the Wolfe Island, Kingston, and Toronto railroad company, for the purpose of taking up a portion of the stock in London, and also with a view of urging upon the Government the necessity of giving without loss of time the royal assent to the Provincial Act incorporating the said company. About the 20th of October last, Mr. Stuart had an interview with Lord Grey, the colonial secretary on the subject, when he strongly urged upon him the propriety of the royal assent being given as soon as possible, and though his Lordship then seemed to throw various obstacles in the way, yet it is now gratifying to find by the Official Gazette of Saturday, that our bill with all the others passed last session, have received the royal assent;—we make the following extract from the proclamation in the Gazette:—

Now Know Ye, that the aforesaid Bills, respectively intitled, "An Act to incorporate a Company to extend the Great Western Railroad from Hamilton to Toronto," "An Act to amend an Act passed in the eighth year of Her Majesty's Reign, intituled, An Act to amend an Act passed in the sixth year of the Reign of His late Majesty King William the Fourth, intituled, An Act to incorporate the City of Toronto and Lake Huron Railroad Company," "An Act for erecting a suspension Bridge over the Niagara River at or near the Falls of Niagara," "An Act to restore the rights of certain persons attainted for High Treason," "An Act to incorporate the Wolfe Island, Kingston and Toronto Railroad Company," "An Act to incorporate the Petersboro' and Port Hope Railway Company," "An Act to incorporate the Montreal and Kingston Railroad Company," having been laid before Us in Council, on the Thirtieth day of October, now last past, we have been pleased to assent to each and every of the same; and we do by these presents and according to the provisions of the said Act of Parliament of the United Kingdom of Great Britain and Ireland, passed in the third and fourth years of our reign, assent to each and every of the aforesaid respective bills; of all which our loving subjects, and all others whom these presents may concern, are hereby required to take notice, and to govern themselves accordingly.

#### Northern Railroad.

A section of this important road was opened last week, from Concord to Franklin, N. H. Thence, it is to proceed north westerly to Lebanon, near the mouth of White river in Vermont, where the parties have already agreed that it shall connect with the Vermont Central. At the festival on the opening, Mr. C. T. Russell, one of the Directors, made the following statements on the aspects of the enterprise.

To-day, he said, we had seen 19 of the 68 miles completed. The part completed had cost \$25,000 per mile. Forty-nine miles remained to be done, all of which was under contract, including the bridge over the Connecticut at the mouth of White river. Two-thirds of the grading had been completed, needing only the dressing to be ready for rails. A section of the road immediately beyond Franklin would be opened in the spring. The principal difficulty was the removal of 28,000 cubic yards of rock at Orange, the summit, which would be completed in August, and the whole road would be traversed by cars as early as the first of November next.

Correspondents will oblige us by sending in their communications by Tuesday morning at latest.

### AMERICAN RAILROAD JOURNAL.

Published by D. K. MINOR, 105 Chestnut St., Philadelphia.

Saturday, January 16, 1847.

We ask the attention of our readers to the following notice:

#### NOTICE TO RAILROAD CONTRACTORS.

Proposals will be received by the Subscriber, at the office of the Michigan Central Railroad Company, at Detroit, until the 16th day of February next, for Grading the first thirteen miles of the Extension of the Michigan Central Railroad, from Kalamazoo, westward; said thirteen miles contains about four hundred thousand cubic yards of earth work. Plans and Specifications will be ready for examination at the office of the subscriber after February 1st.

J. W. BROOKS, Supt. & Eng.

Detroit, January 5, 1847.

513

#### Index to the Last Volume.

This useful and necessary appendage to the Journal, for last year, will be ready in a short time and forwarded to each subscriber.

#### Table of American Railroads.

The difficulty of completing this interesting document, has been such as to delay it much longer than we anticipated. It will, however, be completed at the earliest possible period, and forwarded with the Journal.

#### Railroad Iron.

In accordance with our suggestion a short time since, in the Journal, a bar of railroad iron from the new mill of Messrs. Reeve, Buck & Co., Phoenixville, has been deposited at our office, in the FRANKLIN HOUSE, for the inspection of those who are interested in such matters. It is a beautiful sample of the rail, eighteen feet long, weighing sixty pounds to the yard. There is also the fag-end of a bar, broken to show the quality of the iron, which is pronounced, by good judges, a superior article, and we invite all those interested in the construction of railroads, or in the manufacture of iron, to call and look at it.

#### Phoenixville, Pa.

This interesting village is located on the Schuylkill and Reading railroad, about 25 miles from this city. Its importance is chiefly derived from the ironworks of Messrs. Reeve, Buck & Co., and a cotton mill of considerable extent. But that which is most interesting to the visitor is the manufacture of iron, from the raw material, into the various shapes in which it is placed in the market. Here the ore, with the coal and the lime-stone, is placed in the furnace and run into "pigs." Thence it is carried to the puddling furnace, again heated, and after "bringing it to nature," is "balled," squeezed into shape, rolled into bars, cut, piled, re-heated and rolled into railroad bars; or, into merchant bars, or

sheets, from which about 1000 kegs of nails are manufactured and packed every week. The manufacture of rails is, however, the most important, and when we take into consideration the extent of the works, the quantity and expense of the machinery, with the number of workmen, and the skill and labor required, we think the proprietors entitled to much credit for their enterprise and perseverance. In the entire establishment about 500 men are employed, and when we add the colliers, the miners, and the carriers, we think the "industrial classes" will look upon the iron business as one of the important interests of the state.

#### The Prospect.

At the last accounts, there needed the subscription of but a few hundred shares to the capital stock of the Pennsylvania railroad, to obtain the charter. The citizens of Philadelphia have evinced their confidence in this great work, by coming forward and subscribing generously to the stock, and the result will show that the people in this vicinity have not lost sight of the important advantages which attach to this project. We are among those who feel confident that this line of railroad must prove very profitable as an investment—and we cannot but believe that this route will bring to the city of Philadelphia, an immense amount of additional trade from the interior, as well as the west, which is now drawn from it, by other main channels of conveyance from Ohio, etc., to our Atlantic borders. Let the work go on—and let us have a good road, well constructed and well appointed—and but a few years will elapse before the city of Philadelphia will feel the influence of its establishment, as Boston has, since the completion of the Great Western road.

#### Magnetic Telegraph.

This important invention is likely to become a very common means of correspondence and communication all over the country. The board of trade of Montreal have taken the subject in hand, and will petition government to erect one from Montreal to Halifax. Thus giving the first news by the English steamers that touch at that point on their way to Boston. In that case we should get the first intelligence from Europe by way of Canada.

Another line is recommended to Portland, passing along the line of the railroad now building from Montreal to that city. Another line is contemplated from Montreal to New York, intersecting at Saratoga. The line from Toronto to Montreal, passing through Kingston, will also be built. There is already one from Buffalo to Toronto.

The Pittsburg Gazette of the 31st ult., states that the poles of the Pittsburg, Cincinnati, and Louisville line of telegraphs were being put up, commencing at the corner of Fourth and Smithfield streets, and proceeding towards the Monongahela bridge, over which it is to be carried.

The Baltimore Sun states that books are open in that city for the subscription of stock for the telegraph line from Washington City to New Orleans, via Charleston, S. C. The stock in the line from Baltimore to New York, has netted full twelve per cent on the cost of construction, including the stock given to the patentees. This makes the net income on the actual outlay for the road 24 per cent, "despite all the delays and accidents incident to a new invention." It is proposed to finish the line to New Orleans in four months.

The projectors of the Philadelphia and New Orleans magnetic telegraph, have made an estimate of the expenses and the profits of their line. They judge that by constant operation during the 24 hours

each day, it would earn at the rate of two dollars for each fifteen words, superscription, etc., \$1,440, or \$419,280 in a year. The gross expenses are estimated at \$63,000 for the year, and the cost of construction \$300,000.

We saw and conversed with Mr. Eliphalet Case, Jr., a few days ago, who is interested in the line from Pittsburg to Cincinnati. From him we learn that the best prospects promise, in relation to the establishment of the telegraph, upon that line—and we now learn from the Cincinnati Gazette, of a late date, that Mr. C. has returned there, from his visit to the east, and has obtained from the patentees to himself and his associates, a legal transfer of their right to construct a line of telegraph from Cincinnati to Pittsburg, to Lake Erie, to Louisville, to St. Louis, and to New Orleans, via Nashville, and arrangements are making to construct these lines with all despatch. It seems from this conveyance that the proprietors of the patent do not recognize any other authority to construct any of these lines. The business is entrusted to good hands, and Mr. Case's business reputation is ample guaranty that the work will be "put through" with all practicable despatch.

#### Railroad Matters.

The Utica and Schenectady railroad is to be relaid early the ensuing spring, with rails heavier and more substantial than any hitherto used in this country. The grading is now good, the fare has been made reasonable—a little over two cents a mile—and when the new rails are laid, there will be nothing more to be desired. We have a profound conviction, says the Rochester American, that the interests of the several railroad corporations, no less than that of the public, requires such renovation and improvement as are undertaken by the enterprising Utica and Schenectady company. Heavy rails and good grading will ensure cheap fares and large profits.—This is all which can be desired either by the stockholders or the community. The above-mentioned road passes through a valley of extraordinary natural beauty, along which a great current of travel must always go.

The Detroit Free Press states that on the 24th of December, ult., the Michigan Southern railroad company paid to the state treasurer, the second instalment required by their charter for the purchase of the Southern railroad. On the same day the agents of the state started for Monroe for the purpose of transferring the road to the company, and to-day we presume the road will pass from the state and be vested in the company. The amount paid by the company, so far, is \$50,000, leaving \$450,000 to be paid in instalments hereafter. The terms of the sale require the prompt finishing of the road, and the advantages to the fertile portion of the state through which it will pass, must necessarily be very great.

On Tuesday last, the County Commissioners viewed the several highways and town-ways over which the Cape Cod Branch railroad will cross in Sandwich; and the next day, at their meeting in Barnstable, they authorized the corporation to cross said highways and town-ways with the road upon a level. The corporation, however, must construct in the Town Neck lane, a safe passage way, 15 feet wide, and six feet high, under the road, for the cattle to go to Town Neck.

The Baltimore and Ohio railroad company have in use an engine of 25 tons, which, with the aid of a newly constructed snow plough, that is said to have cost only \$50, carries a heavy train up a steep ascent, through snow drifts eight and nine feet deep.

When the line is completed between Berwick and Newcastle, the journey from Edinburgh to London will be a matter of fifteen or sixteen hours. Little more than a century ago, the following notice was given: "9th May, 1734.—A coach will set out from Edinburgh towards the end of next week for London, or any place on the road. To be performed in nine days, being three days sooner than any other coach that travels the road; for which purpose eight stout horses are stationed at proper distances."

The Cincinnati Gazette informs us that the following named gentlemen were, on the 15th December, elected Directors of the Little Miami railroad company for the ensuing year, viz: Jeremiah Morrow, John Kilgour, Jacob Strader, John Kugler, Samuel Barnett, C. Williams, R. R. Springer, G. Taylor, S. Hivling, N. Wright, R. Brachman, W. McCammon. At a subsequent period, the new Board organized by the election of Jeremiah Morrow, President, and Clark Williams, Secretary. At a meeting of the Board held at the office of the company in that city, a dividend of five per cent. was declared out of the profits for the past year, payable in the stock of the company, to all stockholders who had fully paid up their subscriptions previous to the 1st day of July last. On all stock paid up subsequently, a dividend was ordered to be paid pro rata from the first day of each month following the period of such payment.

The people of Bath and the Kennebec towns generally are pushing forward vigorously the project of a railroad from Portland to Augusta, with a branch from Bath to Brunswick. The road is intended ultimately to be extended to Waterville, and from thence to the Penobscot.

An application will be made to the legislature for a charter for a railroad from Lee, Mass., to Housatonicville, to intersect with the Housatonic railroad. We learn from the Pittsfield Sun that a meeting was held at Lee on the 28th ult., at which a report of a survey was made, which represented the route as very feasible. The cost is estimated at \$500,000.

#### Coal Trade--Shipping--and other Items.

The Reading railroad company sent 1,233,561 tons over the road last year, being only 16,438 tons less than the managers estimated the capacity of the road. The quantity sent to market from all the regions in 1846, is in round numbers 2,334,000 tons, against 2,053,633 tons in 1845, being an increase in 1846 of 312,000 tons. This is an immense business, but nothing to compare with what the Reading railroad is destined, ere long, to attain, in the transportation of coal. During the week ending Saturday, 2d inst., says the Cumberland Civilian, nearly 1,000 tons of coal were sent by the Maryland mining company on the Baltimore and Ohio railroad to the eastern markets, notwithstanding the intervention of the holidays.

The Geneva Gazette says that the statement of the business of the collector's office, in this village, as prepared by our attentive collector, Col. Bogert, presents a gratifying account of the trade upon our lake and canal. The amount of tolls received at the office is more than \$8000 greater than that received last year, notwithstanding that there has been a considerable reduction in the rates of tolls on the bulk of the article.

BENJAMIN KINGSBURY, JR., the surveyor of Portland, furnishes a list of the vessels, with their class and tonnage, which have been built and registered in the district of Portland during the year 1846.—The district includes the towns of North Yarmouth, Brunswick, Freeport, Harpswell, and perhaps some

others. The total amount of new vessels is 49, viz: three ships, twenty-two barques, fourteen brigs, eleven schooners and one sloop, the tonnage of which is 10,467—an increase over last year of 2171 tons. Three barques and one schooner were built for Boston, and one barque for New York.

The proposition to establish a line of steam packets between Richmond, Va., and New York, has been revived, and a petition presented to the Legislature of Virginia, to incorporate a company for this purpose.

The New York Tribune states that the contract for the second ship of the steam navigation company was made on Monday, and next day preparations for the getting up the frame work were commenced. The first ship will be launched about the 15th prox. We are very glad to learn that the subscription to the stock of this company is going on favorably, and that it only falls short \$76,000 of the amount needed—500,000. This will probably be taken within a week or two.

A new mill-pond, covering 80 acres, has lately been formed at Cabotville, Mass. The power acquired by both dams is estimated to be sufficient to carry from 80,000 to 100,000 spindles. A few years of prosperity will doubtless witness the rise of a village of 8,000 to 10,000 inhabitants, where, until within a few years, the solitude has been almost unbroken, since the red man roved along the banks, or darted his canoe across the waters.

A memorial is to be presented at the coming session of the Legislature of N. York, for a canal upon the south side of Long Island. The project is to unite and make navigable the several bays upon the south side, from Riverhead or Southampton, to Coney Island.

The type-setting machine noticed in our columns last week, as having been successfully introduced to work in the office of the New York Sun, seems to be an old affair, which was abandoned some years ago in England. The New York Herald of the 27th ult., makes the following reference to it:—

"Some of the daily papers of last week have brought this machine before the public as a great wonder. But unhappily it is neither that nor a novelty, nor a dangerous competitor to type-setters.—It was known long ago in England, and has been tried in Clowes' printing office, in London, where it has been demonstrated that its application to practical purposes offers no pecuniary advantage or economy, though it can set up a large quantity of type; it takes as much time to fill the canals again with type as it now takes to set them up by hand, and the setting up with the machine gives occasion to so much disorder and pi that Clowes found it a losing experiment, and returned the steam type-setter to its inventor."

#### "Parallel Railroads."

Under the above caption, the Rochester Democrat remarks that "the construction of a railroad on the line of the canal from Rochester to Syracuse, is again the subject of agitation in the towns on the proposed route. The presses at the points most interested speak warmly in favor of the measure, and those who are most active in the agitation feel quite confident that the work will eventually be constructed. In regard to the expediency of this work and its prospects of success, as well as the effects upon the interests of the state, we are, after a full investigation of the subject, constrained to differ from those who are taking measures to urge it forward. In the first place, we have no faith that the capital can be raised. We judge so from the fact that the state, within the last five years, has authorized the construction of some fourteen or fifteen railroads, all of them on important routes, none of which have been

touched beyond partial surveys. The citizens of Buffalo have subscribed liberally to the Attica and Hornellsville road; but there is very little prospect that it will be built immediately. If capital cannot be procured for these works, where shall we find the sum necessary for the construction of a line that will have to compete with the canal as well as the line already in operation? It surely cannot be raised along the route, and the course of our legislature in reference to railroads, claiming the right to regulate fares and reduce profits at pleasure, however just such interference may be deemed to be, will effectually deter eastern capitalists from investing in New York enterprises.

"A number of weighty objections present themselves against this enterprise—objections that have received additional force from the discussions in the various papers favorable to the project. The friends of the route claim that their work, if constructed, will reduce the rates of fare so low that all the travel will be diverted from the canals to the railroads.—So far as the travelling public alone are concerned, this might prove a benefit. But the canal interest is the great interest of the state. It gives employment to thousands where railroads do to tens; and renders profitable large investments in boats, packets and warehouses. In time it will contribute largely to the ordinary expenses of the state, and relieve the people from general taxation. A large debt is now upon its hands, and the work of enlargement—a work all important, by the side of which railroads dwindle into insignificance, is also thrown upon its resources. The friends of the canal—and they comprise five-sixths of the people of Western New York—will never consent that this great work shall be crippled for the benefit of the travelling public and a mere corporation."

We agree entirely with the editor of the Democrat in most of his views as given in this article, but not in his opinion of the value of railroads.

#### Manufacture of Plate Glass in England.

The Mining Journal states that perhaps there is no one article, the produce of the manufactures of the isles of Great Britain, in which there has been, for the last thirty years, so much room for the investment of capital, in competition with those who held the trade in their own hands, as that of plate glass. The statistics of this manufacture show some extraordinary features—always having a demand far beyond the power of the makers to supply, enormous profits have been made; and it is a well-known fact that one house, in 1845, the year of the total repeal of the duty, made in twelve months a profit of £30,000 on a paid-up capital of £125,000, or very nearly 25 per cent. per annum. Notwithstanding the increasing supply annually, since 1819, the demand has increased in a greater ratio; in that year the manufacture was 3000 superficial feet per week, of indifferent quality, with no complaint as to the supply; in 1827 it was 5000 feet, considerably improved, but inadequate to the demand; in 1836 it was 7000 feet, improved, but still insufficient; and in 1844 it had risen to 23,000 feet per week, still improving in quality, but the supply more inadequate than ever. In 1819 the average price for all sizes was from 20s. to 25s. per foot, and is now from 5s. to 6s. per foot. Large plates—say 144 inches by 75 inches—could not be manufactured till about the year 1836; they are now made with facility, and sold at 35s. 7d. per foot, while French plates, made at St. Gobain, free of duty, cannot be obtained of that size under 67s. 11d. per foot. There are still only seven houses engaged in this manufacture; the sales

average 45,000 feet per week; and the demand is so on the increase, that the works are kept in constant operation, some of them day and night. The duty remitted in 1845 amounted to about forty per cent. on the cost price—while such reduction has only benefited the consumer to the extent of fifteen per cent.; and even at these enormously increased profits, as we have before stated, the demand far exceeds the supply.

#### Awful Neglect and Accident.

We are particularly pained to day, to record the details of one of the most shocking accidents it has ever been our lot to know in this country, which took place upon the Reading railroad, on Thursday evening last. The explosion occurred just beyond the Mill creek bridge, a little way above Manayunk, some nine or ten miles from this city—by which seven beings were immediately killed—not one of the whole number present, being left to tell the story! The locomotive attached to an empty coal train, bound up, exploded with a dreadful crash, at the spot we have named above, destroying the engine, tender, etc., and blowing to atoms the persons who were unfortunately upon the cars. The "Spirit of the Times" gives the following terrible particulars in relation to this melancholy accident.

The cause of the explosion, says that paper, is, of course, enveloped in mystery, and can only form the subject of conjecture. The most rational conclusion is that the water was allowed to get out of the boiler, and when the flues were perhaps red hot, the water was let on. Gas being thus rapidly generated produced the explosion. The boiler exploded upwards and outwards, throwing the driving wheels out each side, tearing the engine to pieces, staving in the tank, wrecking the tender, damaging half a dozen of the cars—and producing altogether, it is believed, the most frightful wreck of the kind ever beheld. The terrible result that ensued was never equalled. The body, or rather the trunk of the body of one of the brake men was thrown up a hill, the distance of at least two hundred and fifty yards. Beside, or near him, were two pieces of iron from the boiler, weighing two or three hundred pounds each, that were found indented some two and a half feet into the ground. Another body was found upon a small island of ice in the stream, that had been blown through a large tree, in the limbs of which parts of the clothing were hanging. The body supposed to be that of the engineer was discovered driven into the water tank. Sticks of wood were forced thro' it, and from this circumstance, it is thought that the unfortunate man must have been either on or near the wood-pile, or it may have been, was in the act of handling the billets at the moment of the accident. One man was blown up the hill and his body being doubled up, was sent through a fence, which it carried with it. A body was found with nothing on it save a scarf around his neck; others with only pieces of the flannel shirt. Out of the seven bodies, there was not more than one that was whole enough to be recognized with any certainty. All were stripped entirely of their clothing, except here and there a remnant that clung to some portion of them. The head of one of the men was found mashed to a jelly, another was found

separated from the trunk, and an arm was picked up in a field with a tin cup in the hand. The corpses were all horribly mutilated, torn, burnt, and blackened.

The report of the explosion was tremendous. It was heard a great distance, and the concussion shook the windows at the Falls of the Schuylkill, four miles from the scene. The locomotive was an eight wheel one of the largest and finest description, and was named "Neversink." The collecting of the bodies yesterday was a melancholy and distressing sight; the most affecting part of which was an aged father bending over and bathing the corpse of his son.

The agents of the company at this end of the road, immediately on the receipt of the intelligence of the accident, proceeded to the scene of the disaster, and were untiring in every exertion that humanity dictated.

#### Commerce of the Canals.

The Albany Argus has prepared, from official sources, a table of the commerce of the canals of the state for the past season. It presents a very gratifying result of the year's business, and exhibits in strong colors the wealth of that state and of the west.

Accompanying the table showing the movement from and to the Hudson for the past season, is a similar one of the movement for the season of 1845.

It is shown that there is an increase in the tonnage of 172,579 tons, and of \$14,826,461 in the value of the property transported, and the excess both in tonnage and value over previous years is still greater.

The value of the entire movement of property from and to the Hudson, is still greater by \$4,490,353 than the exports of the United States for the fiscal year ending July, 1844, and greater by \$7,297,845 than the value of the goods imported into the United States for the same time.

These facts speak volumes in favor of the importance of this commerce, not only to that state, but in a national point of view, as worthy the attention of the general government.

#### Plank Roads.

The subject of plank roads seems to have excited a good deal of attention lately. The Syracuse Journal of a late date, remarks that the one constructed last year, in that county, has "satisfied every person who has travelled on it, of its vast superiority over any other road in the country. We are permitted to publish the following letter to the Hon. John Stryker, of Rome, from the Engineer of that road, as applications are continually made to him for information on the subject."

The following letter from GEO. GEDDES, Esq. C. E. upon this subject, will be read with interest. Mr. G. is very favorably known to the railroad community—and he is eminently well qualified to offer information upon this subject. We learn that Mr. G. and Mr. Alvord of Salina, were the principal managers in constructing the plank road from Salina to Brewerton.

"They visited Canada together"—says the Rochester American, "previous to the commencement of this road, examined several, consulted with experienced gentlemen connected with enterprises of this character there, and then returned with a general knowledge, and made their estimates and commenced operations. Some months ago we had

the pleasure of an interview with Mr. Geddes, and were both astonished and gratified by his statements of the complete success attending plank roads, wherever tried. He was firmly of the opinion that a system of such roads radiating from this city as a centre, into the rich country which surrounds it, would very greatly increase its wealth and business, as well as prove highly profitable to the stockholders. We commend his article to the attention of the public. The draft of a proposed act, therein mentioned, we omit, as not of such general interest."

FAIRMOUNT, ONON. CO. N. Y. }  
December 24, 1846. }

JOHN STRYKER, Esq., DEAR SIR.—Your letter of the 22d inst., came to hand yesterday. You say that it is proposed to make plank roads in two directions from Rome, and that you understand that I am "fully informed as to the cost, manner of construction, etc." and you ask me to communicate to you such information as may be useful to you.

I have twice visited Canada to procure information upon this subject; and as you probably know, during the past year, I have had charge, as Engineer, of the construction of the Salina and Central Square plank road, twelve and a half miles of which are finished and now in use. Any information that I have acquired by my examinations and experience is at your service; and so far as I can, in a letter, I will state what appears to me to be important to the objects you have in view.

By the new constitution, general laws are to be passed providing for the creation of corporations for such purposes as making plank roads; and, in my judgment, the first thing is for all the friends of plank board projects to unite, and procure the enactment of such a law by the Legislature, at an early day of the next session. At the suggestion of various gentlemen, I have drawn up a law, which, in my opinion, will give all the powers necessary to the companies organized under it, and amply protect the public and the owners of land from injury. A copy of the proposed law I will send you.

The mode of construction of a plank road is the point upon which you are most desirous of information.

In case it is expected that a *very great amount of travel* is to pass over the road, two tracks, each eight feet wide, will be required; but it is not probable that any road coming into your town will require more than one track; at any rate for more than a few miles out of town. It is difficult to persuade a man, who has not seen the thing tried, that one track is entirely sufficient, except in cases of an *extraordinary amount* of travel; but it is so, and the road out of Salina, has but one track, except over places where proper earth could not be obtained with which to make a road along side of the plank. Over the light sand plains, where, in dry weather, a wagon would cut into the sand, we laid two tracks, but over clay or common earth, we laid but one; and during the very rainy autumn just past, our road

has constantly been in good order for teams to turn out.

In case there is so much travel that common earth cannot be kept in good order for turning out—then the tolls paid by that travel will compensate for the cost of the second track; so that the interests of the public and the owners meet, and the thing will regulate itself. If the second track is required, then its cost will be a good investment.

There is another particular in which the public interests, and the interests of the owners go together—the tolls. The character of the Salina road allows the Directors to regulate the tolls within certain limits; in summer we exact three-fourths, and in winter one-half the sum allowed us from vehicles drawn by two animals. It is our interests to encourage such an amount of travel as to insure the *wearing* out, rather than the rotting out of our timber, and by taxing the travel lightly, we increase the amount.

The track is laid on one side of the road, so that teams coming into town keep it, and teams going out yield it in passing. The tonnage being chiefly in one direction, it is generally the unloaded teams that have to do all the turning out.

The plank are of hemlock, eight feet long and four inches thick, laid crosswise of the road, on sills four inches square. The earth is broken up and made fine, the sills are bedded into it, and the surface graded smooth; the plank are then laid on the sills, care being taken that the earth is up to and touches the plank at every point. This is important, for if any space be left for air under the plank, or along side the sills, dry rot follows. I saw, in Canada, a road that had been worn out, and was being rebuilt. The sills were good and the plank were sound on the under side, save where air had supplied the place of earth, and there they were destroyed by rot. The plank having been laid, the next thing is to grade a road some ten or twelve feet wide on one side, and two or three on the other, by taking earth from the ditches on each side, and bringing it by a ditch scraper just up to and even with the upper side of the plank, so that if a wheel runs off the track, it passes upon a smooth surface of earth. The ends of the plank should not be laid even, but a part should project from two to four inches by the general line, to prevent a rut being cut just along the ends of the plank. If the ends of the plank are even, and a small rut is made, the wheel of a loaded wagon will scrape along the ends for some distance before it will rise up to the top of the plank, unless the wagon moves in a direction nearly across the road; but if the wheel can not move two feet forward without coming square against the edge of a projecting plank, the difficulty of getting on the road is avoided. It is not necessary to pin or spike, the plank to the sills.

Perfect drainage must be secured, and to that end the ditches must be deep and wide, and good sluices wherever water crosses the road. This is the important point—drain perfectly.

As to the cost of such a road, I will answer you by giving you a copy of my estimate for the Salina road, which very considerably exceeded the actual cost. It is proper to inform you that this road was made upon the bed of an old road, filled in many places with stone and logs. The right of way cost us nothing. The estimate was for plank three or four inches thick. Where we laid two tracks, we laid one of them with three inch plank, but the main track was four inches thick. It is economy to use thick plank if the travel is sufficient to *wear* out the road, but if it is to rot before it is worn out, then of course thin plank should be used. The Canada roads are generally three inches thick and are made of pine, and last about eight years.

Estimate of the cost of a single track plank road, eight feet wide, for one mile:

Sills 4 in. by 4 in..	14080 ft.	B. M.
8 ft. width of p'k 3 in. thick	127726 "	"
	140800	
At \$5 a thousand, . . .	5	
	\$704,00	
Laying and grading \$1, a rod, . . . . .	320,00	
	1024,00	
Engineering, Superintendence, etc. 10 per cent.	102 00	
	1126,00	
Gate houses, say \$100,	100,000	
	1226,00	
For a 4 in. road add 42240 ft. at \$5 per M., . .	211,00	
	1437,00	
Sluices, bridges and contingencies, . . . .	63,00	
	\$1500,00	

We did not let out to contractors the construction of our road, for the reason that, we were very desirous of securing the bedding of the timber perfectly, a thing that my observation in Canada satisfied me was not always done, when the work was made by the rod; and as plank road making was a new business, no person was willing to undertake the work at the price estimated. By doing our work by the day, we not only secured its perfect construction in this particular, but we saved some thousands of dollars in the cost. After we had acquired experience and skill, we reduced the cost of grading and laying the road to from thirty to fifty cents a rod, including construction of sluices and bridges, and grubbing, and in short every thing but materials and superintendence.

If you make plank roads, I advise you by all means to do the work by the day, and put at the head of the business, a man who is fully competent to engineer and direct the whole matter. The variation of a few inches in the line of a road, may tell largely in the

cost of construction. The lumber you can best obtain by dividing the road into eighty rod sections, staking them out and letting them to the most favorable proposers—the lumber to be distributed along the line equally as near as may be, as it is delivered.

As to the value of plank roads to the public and to the owners, I can best answer you by saying that I have seen a McAdamised road taken up, eight feet in width, to make room for a plank track—and by informing you that men who have travelled over the best roads in England, say that there is not in Great Britain as good a road as the Salina plank road.

Our stock cannot be purchased at par,—and various projects are being started for the extension of our road, and constructing other roads, radiating from the capital of our county.

Very respectfully,

Yours, &c.

GEO. GEDDES, Civil Engineer.

#### New York and Albany or Hudson River Railroad.

We find the following exceedingly appropriate article on this important subject, in a late number of the *New York Journal of Commerce*. It is from the able pen of a gentleman who has, often before, labored for the best interests of the city of New York, without having his labors—at the time—duly appreciated by those most deeply interested. He is, however, fortunately for the people, one of those men who, conscious of being right on the subject under consideration, labor on, even though others differ in opinion, and labor against them. In this great work, however, as in that of "city sewerage"—for which he labored long and devotedly—he may look for entire success, at an early day, if the property holders of New York can be made to see their own true interest.

From the *Journal of Commerce* of 19th December.

**Hudson River Railroad.**—The Hudson river, among its great benefits, accommodates a breadth of country on each side of it of about 20 miles, or a strip forty miles wide. The industry conducted within that space finds accommodation at the river towns for prosecuting its business with the city: accommodation of all sorts,—ware-houses, taverns, merchants, capital: indeed, all the arrangements necessary for the business of an active region of country. A railroad running through these towns will, at the close of navigation, take up the trade, where the boats have it, and carry it on without any other change than that of the medium of conveyance. The facilities of the kind above enumerated, will be quite as needful to those who use the railroad, as to those who use the river. There are people, however, intelligent, candid and respectable, who insist that a road running on the extreme right of the belt of forty miles, cut though it must be through cultivated fields and along small streams and rivulets, and over the mountains, and near the Housatonic road, would better accommodate the trade, be more profitable to New York, and yield a larger revenue on the stock. A mere statement of the case, so that reflection may seize hold of and act upon it, must set the matter right to most

minds. They will perceive that those who go to the river when the navigation is open, will conduct business there over a railroad when it is closed—that a road twenty miles to the right of the river would be of no use to those living on its left, and who in the winter might cross on the ice to a nearer conveyance—that no facilities for conducting trade would exist on the inland route—and that the wealth accumulated at the towns would be seriously diminished by a road that should divert from them their usual trade.

The inland road would, like our lateral canals, extend through a fine agricultural region, and like them not pay; the river road should be where the great trade has always been conducted to the profit of carriers and all engaged in it.

There are those also, who are constantly urging that a road along the river will be unable to stand competition with the river, unless the very highest speed is accomplished, such as is usual on the English roads, and that it will cost too much to adopt their plans.

The objection applies to any road between this and Albany, but the answer to it, as far as concerns the road in question, is most complete.

The Edinburgh Review for October, 1846, in a powerful article on "Railways at home and abroad," shows that what in England produces high speed, may more easily be obtained cheap, on the river route, than on any other whatever.

One great expense in building the English roads arose from the rails being sustained "on square stone blocks measuring two feet on the side, and twelve inches deep. Cross sleepers of timber (says the Review) were only used as temporary supports on embankments until their settlement and consolidation should be effected by time and work. The stone blocks are, however, now everywhere abandoned, and the cross sleepers of timber permanently and universally established."

The cheap American plan of cross sleepers of timber, is found in England to be the best; proving that their expensive foundations did not constitute the element as is erroneously supposed, of their superiority in speed. It arose from other causes. They rejected all curves but those of a large radius, and restricted themselves to gradients of a low limit. See Page 260. These, obtained only at immense cost in England, were the main elements of their success in accomplishing high speed.

I attempted to show in a previous article, that the dip which occurred at the highlands in a long chain of mountains;—the course of the valley, straight almost as the flight of an arrow; the flow of the tide extending up to and beyond Albany; made the valley of the Hudson eminently suited for a railroad; and that we should abandon a great natural advantage, an advantage possessed by no other state aspiring to the western trade, to leave it and climb over the mountains.

The surveys show that the general route

through that valley is nearly level, and that the grades are not over seventeen feet in the mile. The few curves which exist have the wide radius of 2000 feet; in a line whose course is generally straight.

On the river route alone, nature has bestowed these important benefits,—benefits which make the transportation of passengers and goods cheap and rapid, which enable an engine of small power to do heavy work; which make the enormous expense that accrues from deep cuttings and heavy embankments unnecessary; and which save expense in maintaining the road, and in repairs, such as belong to those of high grades, built over mountains and across deep valleys.

Objection is also made to the use of this route on the ground of expected difficulty from snow and ice. The Emperor of Russia under the superintendence of Mr. Whistler, an American, is now building a road from St. Petersburg to Moscow, and would no doubt be quite amused to hear that in this latitude hesitation existed for such cause, on the part of those who preferred a route over mountains. It is estimated that every 80 yards of elevation is equivalent to one degree of latitude north, and that the mountains in question are from seven hundred to one thousand feet high. The great snow storm of February 1845 extended to the Boston and Albany road, but the track was cleared in about twenty-four hours. It lay for nearly a fortnight on a road much nearer home. The river road being on the east bank of the river, (the hills with an aspect to the West,) but little difficulty can be experienced from the melting of the snows, certainly as little as on any other route.

Those who are alarmed at the occasional passage of the road over the few shallow inlets of the river, may read with profit an article in the Foreign Quarterly for January, on the relative advantages of the routes through Asia proposed to the East India Company for a road to be built by them from Mirzapore to Calcutta; one, along the Ganges, the other and the favorite, extending over an extensive district of country subject to inundations, and but lately twenty feet under water, and requiring a causeway twenty-five feet high.

Trivial objections such as those which have been considered were long ago overcome in the progress of the railroad enterprises of the world, and if New York is to halt for them, she must not only go behind Boston, but behind all the world besides. They are objections not taken by Engineers, nor by persons who would probably otherwise be friends of this route.

While we are discussing them however, Boston is securing the trade that belongs rightfully to us, the trade with our back country, reached by us, except in the winter, through the valley of the Hudson and the Mohawk, and she is securing it as perfectly as if the Hudson flowed one quarter of the year from Albany to Boston.

Should some convulsion of nature deprive us of its waters, what amount would we not

pay to restore them to its banks; and yet its loss for one fourth of the time, (one year out of four,) and what is equivalent to its diversion for that time to Boston, make no impression on our sagacious capitalists!

A rivalry in extravagance, hitherto unknown, in our dwellings and their decoration, seems to animate them, instead of that exalted rivalry which civilization has lately called into play for the benefit of mankind.

Boston acts not thus, her railroads form a perfect net work over Massachusetts, and they are penetrating into our own state. Acting upon the cupidity of Northern and Western New York, to whom she offered a second market for their sales and purchases, she readily overcame every feeling of friendship and allegiance to this city, and from her liberality, her help to our main line of roads which this city would not build, procured weight and influence in the councils of our state.

This city has none. "You opposed our canal," said a member to me when pressing on him the necessity of this road; "you would not help to build our railroads; your best men take no part nor interest in our legislation, you cannot expect much sympathy for you here."

This is the contemptuous feeling which our want of public spirit has secured, and is likely to continue towards us, while the master spirits of Boston have won the respect of all men, and their counsels are listened to by the public functionaries of Massachusetts, and they take part and lot in the fortunes of the state.

A happy day will it be for New York, when our best citizens shall employ themselves in matters of public concern, and see that the impress of their opinion and acts is made on her future progress.

They may then ask some other question than the one which now may safely be answered in the affirmative, whether it will pay a good dividend should they subscribe to a road to Albany.

The city of New York has now before her, a charter, obtained with the greatest difficulty, and the maps and survey of the river route, which expires unless subscribed to by the first of March. An engineer of tried experience, and of undoubted integrity, whose services are withheld from a rival state, stands ready to stake a reputation not surpassed for prudence and skill, on the success of this enterprise, an enterprise which a few disinterested men, with a generous subscription of their own capital, present confidently to their fellow citizens.

GEO. B. BUTLER.

**A Railroad to the Pacific.**

Geo. A. Wilkes, in the course of a pamphlet, urging the importance of a railroad from the Atlantic to the Pacific, says that "aside from the considerations of national aggrandizement this work is warranted by considerations which make their appeal as well to the heart of the philanthropist, as to the calculation of the statesman. It would not only bind with an absorbing and relentless attraction, the separate interests of the north and south, but would be a benefaction to the laboring masses of both, and would come with a peculiar grace from a parental government to its most deserving children. In addition, it would be an evidence in favor of the government, that among all the chartered privileges lavished time and again upon the rich, it had found it in its heart to make at least one charter for the poor. Lastly, if the magnetic telegraph should be added to this comprehensive scheme, where shall calculation look for the limits of its vast results? Basing our calculations upon our wonderful advance in the present century, it is no extravagance to predict that in less than fifty years, we shall behold in our beloved country, a government holding the preponderance of power, owning a population of a hundred millions, with a central capital in the great valley of the Mississippi, commanding from its nucleus of power an electric communication over three millions of square miles, and diffusing its enlarged spirit of liberty, philanthropy, peace and good-will, to the uttermost ends of the earth, in a fulness that will realize at least the fondest dreams of the millennium!" He also urges that the earliest practicable time should be adopted to carry out the design, and closes thus:

"While France and New Grenada meditate the segregation of the continent, and while England is employing an expensive squadron in the Arctic sea, we certainly are

called upon to avail ourselves of the superior advantages offered us within the bosom of our own territories, for accomplishing the same grand purpose which impels them.—We owe this to our own character and to future generations, and we also owe it to that spirit of progress which, directed by the spirit of Columbus, awakened our continent from its sleep in the abyss, and which, after having endured a check of four centuries as its only reward, now imperatively demands the consummation of its purpose. Arouse, then, America, and obey the mandate which destiny has imposed upon you for the redemption of a world! Send forth upon its errand the spirit of enfranchised man; nor let it pause till it enlarges the boundaries of freedom to the last meridian, and spreads its generous influence from pole to pole!"—*Phila. Inquirer.*

**BACK VOLUMES OF THE RAILROAD JOURNAL** for sale at the office, No. 105 Chestnut street.

**A. & G. RALSTON & CO., NO. 4** South Front St., Philadelphia, Pa.

Have now on hand, for sale, Railroad Iron, viz: 180 tons 2½ x 1 inch Flat Punched Rails, 20 ft. long. 25 " 2½ x 1 " Flange Iron Rails. 75 " 1 x 1 " Flat Punched Bars for Drafts in Mines. A full assortment of Railroad Spikes, Boat and Ship Spikes. They are prepared to execute orders for every description of Railroad Iron and Fixtures.

**RAILWAY IRON.—THE BEST QUALITY** of English Heavy H Rails—60 lbs. to the yard—now in store, landing from the vessel, and on ship board to arrive, for sale on most favorable terms by **DAVIS, BROOKS & CO.,** Jan. 2. [11f] 68 Broad St., New York.

**RAILROAD IRON.—THE NEW JERSEY** Iron Company, Boonton, N. J., are now preparing to make Railroad Bars, and are ready to take orders or make contracts for Rails, deliverable after the first of December next. Apply to **FULLER & BROWN, Agent,** No. 139 Greenwich, corner of Cedar street. September 18, 1846. 10:39

**NICOLL'S PATENT SAFETY SWITCH** for Railroad Turnouts. This invention, for some time in successful operation on one of the principal railroads in the country, effectually prevents engines and their trains from running off the track at a switch, left wrong by accident or design.

It acts independently of the main track rails, being laid down, or removed, without cutting or displacing them.

It is never touched by passing trains, except when in use, preventing their running off the track. It is simple in its construction and operation, requiring only two Castings and two Rails; the latter, even if much worn or used, not objectionable.

Working Models of the Safety Switch may be seen at Messrs. Davenport and Bridges, Cambridgeport, Mass., and at the office of the Railroad Journal, New York.

Plans, Specifications, and all information obtained on application to the Subscriber, Inventor, and Patentee **G. A. NICOLLS,** ja45 Reading, Pa.

**RAILROAD IRON.—THE SUBSCRIBER'S** New Rail Iron Mill at Phoenixville, Pa., is expected to be ready to go into operation by the 1st of September, and will be capable of turning out 30 to 40 tons or finished Rails per day. They are now prepared to receive orders to that extent, deliverable after the 1st of October next, for heavy rails of any pattern now in use, equal in quality and finish to best imported.

**PIG IRON.—**They are also receiving weekly 150 to 200 tons of No. 1 Phoenix Foundry Iron, well adapted for light castings.

**REEVES, BUCK & CO.,** 45 North Water St., Philadelphia, or by their Agent, **ROBT. NICHOLS,** 79 Water St., New York

**THE SUBSCRIBERS, AGENTS FOR** the sale of

Codorus, Glendon, Spring M.J. and Valley, } Pig Iron.

Have now a supply, and respectfully solicit the patronage of persons engaged in the making of Machinery, for which purpose the above makes of Pig Iron are particularly adapted.

They are also sole Agents for Watson's celebrated Fire Bricks and prepared Kaolin or Fire Clay orders for which are promptly supplied.

**SAM'L KIMBER, & CO.,** 59 North Wharves, Jan. 14, 1846. [1y4] Philadelphia, Pa.

**RAY'S EQUALIZING RAILWAY TRUCK.—THE SUBSCRIBER** having recently formed a business connection in the City of New

York, expressly for the manufacture of the newly patented and highly approved Railroad Truck of Mr. Fowler M. Ray, is ready to receive orders for building the same, from Railroad Companies and Car Builders in the United States, and elsewhere.

The above Truck has now been in use from one to two years on several roads a sufficient length of time to test its durability, and other good qualities, and to satisfy those who have used it, as may be seen by reference to the certificates which follow this notice.

There have been several improvements lately introduced upon the Truck, such as additional springs in the bolster of passenger cars, making them delightful riding cars—adapting it to tenders, trucks forward of the locomotive, and freight cars, which, with its original good qualities, make it in all respects the most desirable truck now offered to the public.

Orders for the above, will, for the present, be executed at the New York Screw Mill, corner 33d street and 3d avenue, (late P. Cooper's rolling mills) and at the Steam Engine Shop of T. F. Secor & Co., foot of 9th street, East

river, (of which firm the subscriber was late a partner) under the immediate supervision of Mr. Ray himself.

Several sets of trucks containing the latest improvements have recently been turned out for the New York and Erie railroad, and the New Jersey Transportation company, which may be seen upon said roads.

The patronage of Railroad Companies and Car Builders is respectfully solicited.

**New York, May 4, 1846.** **W. H. CALKINS, and Others.** To all whom it may concern:—This is to certify that the New Haven, Hartford and Springfield railroad co., have had in use six sets of F. M. Ray's patent trucks for the last 30 months, during which time it appears to me, they have proved to be the best and most economical truck now in use.

[Signed,] **WILLIAM ROE, Sup't of Power.** I certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Philadelphia and Reading railroad for some time past, under a passenger car.

For simplicity of construction, economy in cost, lightness of material, and extreme ease of motion, I consider it the best truck we have ever used. Its peculiar make also renders it less liable to be thrown off the track, when passing over any obstruction. We intend using it extensively under the passenger and freight cars of the above road.

**Reading, Pa., October 6, 1845.** [Signed,] **G. A. NICOLL,** Supt. Transportation, etc., Philadelphia and Reading Railroad.

To all whom it may concern:—This is to certify that the N. Jersey Railroad and Transportation company have used Fowler M. Ray's Truck for the last seven months, during which time it has operated to our entire satisfaction. I have no hesitation in saying that it is the simplest and most economical truck now in use.

[Signed,] **T. L. SMITH,** Jersey City, November 4, 1845. N. Jersey Railroad and Transp. Co. This is to certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Long Island railroad for the last year, under a freight car.

For simplicity of construction, economy in cost, lightness of material and ease of motion, I consider it equal to any truck we have in use.

[Signed,] **JOHN LEACH,** Long Island Railroad Depot, Jamaica November 12, 1845. } 1y19 Sup't Motive Power.

**RICH & CO'S IMPROVED PATENT SALAMANDER SAFES.**

Warranted free from dampness, as well as fire and thief proof.

Particular attention is invited to the following certificates, which speak for themselves:

**TEST No. 10.**

*Certificate from Mr. Silas C. Field, of Vicksburgh, Mississippi.*

On the morning of the 14th ult., the store owned and occupied by me in this city, was, with its contents, entirely consumed by fire. My stock of goods consisted of oil, rosin, lard, pork, sugar, molasses, liquors, and other articles of a combustible nature, in the midst of which was one of Rich's Improved Patent Salamander Safes, which I purchased last October of Mr. Isaac Bridge, New Orleans, and which contained my books and papers. This safe was red hot, and did not cool sufficiently to be opened until 16 hours after it was taken from the ruins. At the expiration of that time it was unlocked, when its contents proved to be entirely uninjured, and not even discolored. I deem this test sufficient to show that the high reputation enjoyed by Rich's Safes is well merited.

S. C. FIELD.

**TEST No. 11.—Certificate.**

By the fire which occurred in this village on the 27th July last, our Law Office, together with many other buildings, was destroyed—we had in our office one of Rich's Improved Patent Salamander Safes, which, though heated red hot, preserved, without being the least damaged, many papers valuable to our clients—the envelopes of a few papers being slightly scorched. Some twenty-four hours after the fire, the Safe was removed, and so hot was it, that several hours were required for it to cool off. Our office was in the second story of a large brick building, all the wood used in construction of said house being pitch pine. While the Safe was red hot, one of the walls tumbled in, and so injured the lock that it was necessary to break the door open. From this test, we feel no hesitancy in recommending "Rich's Patent Salamander Safe" as entirely fire proof.

GOREE & KING.

Marion, Ala., Sept. 15th, 1846.

*Still other Tests in the Great Fire of July 19, 1845.*

The undersigned purchased of A. S. Martin, No. 138½ Water street, one of Rich's Improved Patent Salamander Safes, which was in our store, No. 54 Exchange place. The store was entirely consumed in the great conflagration on the morning of the 19th inst. The safe was taken from the ruins 52 hours after, and on opening it, the books and papers were found entirely uninjured by fire, and only slightly wet—the leather on some of the books was parched by the extreme heat.

RICHARDS & CHONKHITE.

Benton, Miss., December 27, 1845.

One of Rich's Improved Salamander Safes, which I purchased on the 2d of June last of A. S. Marvin, 138½ Water street, agent for the manufacturer, was exposed to the most intense heat during the late dreadful conflagration. The store which I occupied, No. 46 Broad street, was entirely consumed; the safe fell from the 3d story, about 15 feet, into the cellar, and remained there 14 hours, and when found, I am told, and from its appearance afterwards, should judge that it had been heated to a red heat. On opening it, the books and papers were found not to have been touched by fire. I deem this ordeal sufficient to confirm fully the reputation that Rich's safe has already obtained for preserving its contents against all hazards.

(Signed,)

WM. BLOODGOOD.

New York, 21st July, 1845.

Reference made to upwards of nine hundred and fifty merchants, cashiers, brokers, and officers of courts and counties, who have Rich's Safe's in use.

The above safes are finished in the neatest manner, and can be made to order at short notice, of any size and pattern, and fitted to contain plate, jewelry, etc. Prices from \$50 to \$500 each. For sale by

A. S. MARVIN, General Agent,  
138½ Water st., N. Y.

Also by Isaac Bridge 76 Magazine street, New Orleans.

Also by Lewis M Hatch, 130 Meeting street Charleston, S. C.

**FRENCH AND BAIRD'S PATENT SPARK ARRESTER.**

TO THOSE INTERESTED IN Railroads, Railroad Directors and Managers are respectfully invited to examine an improved SPARK ARRESTER, recently patented by the undersigned.

Our improved Spark Arresters have been extensively used during the last year on both passenger and freight engines, and have been brought to such a state of perfection that no annoyance from sparks or dust from the chimney of engines on which they are used is experienced.

These Arresters are constructed on an entirely different principle from any heretofore offered to the public. The form is such that a rotary motion is imparted to the heated air, smoke and sparks passing through the chimney, and by the centrifugal force thus acquired by the sparks and dust they are separated from the smoke and steam, and thrown into an outer chamber of the chimney through openings near its top, from whence they fall by their own gravity to the bottom of this chamber; the smoke and steam passing off at the top of the chimney, through a capacious and unobstructed passage, thus arresting the sparks without impairing the power of the engine by diminishing the draught or activity of the fire in the furnace.

These chimneys and arresters are simple, durable and neat in appearance. They are now in use on the following roads, to the managers and other officers of which we are at liberty to refer those who may desire to purchase or obtain further information in regard to their merits:

R. L. Stevens, President Camden and Amboy Railroad Company; Richard Peters, Superintendent Georgia Railroad, Augusta, Ga.; G. A. Nicolls, Superintendent Philadelphia, Reading and Pottsville Railroad, Reading, Pa.; W. E. Morris, President Philadelphia, Germantown and Norristown Railroad Company, Philadelphia; E. B. Dudley, President W. and R. Railroad Company, Wilmington, N. C.; Col. James Gadsden, President S. C. and C. Railroad Company, Charleston, S. C.; W. C. Walker, Agent Vicksburgh and Jackson Railroad, Vicksburgh, Miss.; R. S. Van Rensselaer, Engineer and Sup't Hartford and New Haven Railroad; W. R. McKee, Sup't Lexington and Ohio Railroad, Lexington, Ky.; T. L. Smith, Sup't New Jersey Railroad Trans. Co.; J. Elliott, Sup't Motive Power Philadelphia and Wilmington Railroad, Wilmington, Del.; J. O. Stiers, Sup't Elizabethtown and Somerville Railroad; R. R. Cuyler, President Central Railroad Company, Savannah, Ga.; J. D. Gray, Sup't Macon Railroad, Macon, Ga.; J. H. Cleveland, Sup't Southern Railroad, Monroe, Mich.; M. F. Chittenden, Sup't M. P. Central Railroad, Detroit, Mich.; G. B. Fisk, President Long Island Railroad, Brooklyn.

Orders for these Chimneys and Arresters, addressed to the subscribers, care Messrs. Baldwin & Whitney, of this city or to Hinckley & Drury, Boston, will be promptly executed. **FRENCH & BAIRD.**

N. B.—The subscribers will dispose of single rights, or rights for one or more States, on reasonable terms.

Philadelphia, Pa., April 6, 1844.

.. The letters in the figures refer to the article given in the Journal of June, 1844.

ja45

**PATENT HAMMERED RAILROAD, SHIP and Boat Spikes.** The Albany Iron and Nail Works have always on hand, of their own manufacture, a large assortment of Railroad, Ship and Boat Spikes, from 2 to 12 inches in length, and of any form of head. From the excellence of the material always used in their manufacture, and their very general use for railroads and other purposes in this country, the manufacturers have no hesitation in warranting them fully equal to the best spikes in market, both as to quality and appearance. All orders addressed to the subscriber at the works, will be promptly executed. **JOHN F. WINSLOW, Agent.**

Albany Iron and Nail Works, Troy, N. Y. The above spikes may be had at factory prices, of Erastus Corning & Co., Albany; Hart & Merriut, New York; J. H. Whitney, do.; E. J. Eiting, Philadelphia; Wm. E. Coffin & Co., Boston. ja45

**MACHINE WORKS OF ROGERS, Ketchum & Grosvenor, Patterson, N. J.** The undersigned receive orders for the following articles, manufactured by them of the most superior description in every particular. Their works being extensive and the number of hands employed being large, they are enabled to execute both large and small orders with promptness and despatch.

Railroad Work.

Locomotive steam engines and tenders; Driving and other locomotive wheels, axles, springs & flange tires; car wheels of cast iron, from a variety of patterns, and chills; car wheels of cast iron with wrought tires; axles of best American refined iron; springs; boxes and bolts for cars.

Cotton, Wool and Flax Machinery of all descriptions and of the most improved patterns, style and workmanship.

Mill gearing and Millwright work generally; hydraulic and other presses; press screws; callenders; lathes and tools of all kinds; iron and brass castings of all descriptions.

**ROGERS, KETCHUM & GROSVENOR,**  
ja45 Paterson, N. J., or 60 Wall street, N. York.

**PATENT RAILROAD, SHIP AND BOAT Spikes.** The Troy Iron and Nail Factory keeps constantly for sale a very extensive assortment of Wrought Spikes and Nails, from 3 to 10 inches, manufactured by the subscriber's Patent Machinery, which after five years' successful operation, and now almost universal use in the United States (as well as England, where the subscriber obtained a patent) are found superior to any ever offered in market.

Railroad companies may be supplied with Spikes having countersink heads suitable to holes in iron rails, to any amount and on short notice. Almost all the railroads now in progress in the United States are fastened with Spikes made at the above named factory—for which purpose they are found invaluable, as their adhesion is more than double any common spikes made by the hammer.

All orders directed to the Agent, Troy, N. York will be punctually attended to.

**HENRY BURDEN, Agent.**

Spikes are kept for sale, at Factory Prices, by I. & J. Townsend, Albany, and the principal Iron merchants in Albany and Troy; J. I. Brower, 222 Water St., New York; A. M. Jones, Philadelphia; T. Janviers, Baltimore; Degrand & Smith, Boston.

.. Railroad Companies would do well to forward their orders as early as practicable, as the subscriber is desirous of extending the manufacturing so as to keep pace with the daily increasing demand. ja45

**DAVENPORT & BRIDGES CONTINUE** to Manufacture to Order, at their Works, in Cambridgeport, Mass., Passenger and Freight Cars of every description, and of the most improved pattern. They also furnish Snow Ploughs and Chilled Wheels of any pattern and size. Forged Axles, Springs, Boxes and Bolts for Cars at the lowest prices. All orders punctually executed and forwarded to any part of the country.

Our Works are within fifteen minutes ride from State street, Boston—coaches pass every fifteen minutes.

## THE HERRON RAILWAY TRACK,

As seen stripped of the top ballasting

A GOLD MEDAL AWARDED THE INVENTOR BY THE AMERICAN INSTITUTE.

**THE UNDERSIGNED RESPECTFUL**—but 8 feet; the timber being more concentrated under the Rails. A block of hard wood, about 2 feet long and 15 inches wide, is introduced into a square of the trellis for the purpose of giving an additional, and effectual support to the joints of the Rails, which rest upon it. Should these joint blocks become chafed and worn by the working, and imbedding of the chairs, as is now the case on all Railroads, they can be readily replaced without any derangement of the timbers less liable to wear.

The following is a general estimate of its cost near the seaboard. In the interior it will be considerably less.

ESTIMATE OF THE PROBABLE COST OF ONE MILE.

4,224 Timbers, 11 ft. long, 3 x 6 inches = 68,696 ft. b.m., at \$10 = .....\$686 96

587 Oak joint blocks 2 ft. x 3 x 15 in. = 4,403 ft. b.m., at \$13 = ..... 57 24

13,000 Spikes = 2,250 lbs. at 4½ cts. .... 101 25

Workmanship free of patent charge ..... 600 00

The above cut represents the "Herron Track" as it is laid on the Philadelphia and Reading, and on the Baltimore and Susquehanna Railroads. The intersection of the sills of the trellis are 5 feet from centre to centre, while in the new construction they are only 2½ feet. This renders the string piece unnecessary, thus removing the only objectionable feature found in the Track.

The result of experience has proved that all Tracks constructed with longitudinal timbers, such as mud sills, and more especially, the continuous bearing string pieces retain the rain water that falls between the Rails, which, being thus confined, settles along those timbers, and accumulating in quantity flows rapidly along them on the descending grades, washing out the earth from under the timber, and frequently causing large breaches in the embankments of the road. Whereas all water intercepted by the oblique sills of the trellis, is discharged immediately into the side ditches.

In the 5 foot plan, the Track occupies a Road bed nearly 11 feet wide, while the new construction takes

Cost of one mile including the laying of the Rail .....\$1,145 45

He has made other important improvements, which will be shown in properly proportioned models, that give a much better idea of the great strength of the Track than a drawing will do.

Sales of the Patent right to all the distant States will be made on liberal terms.

JAMES HERRON.  
Civil Engineer and Patentee.  
No. 277 South Tenth St., Philadelphia. 33tf

# ENGLISH PATENT WIRE ROPES—FOR THE USE OF MINES, RAILWAYS, ETC.—

for sale or imported to order by the subscriber.

These Ropes are manufactured on an entirely different principle from any other; and are now almost exclusively used in the collieries and on the railways in Great Britain, where they are considered to be greatly superior to hempen ropes, or iron chains, as regards safety, durability and economy. The plan upon which they are made effectually secures them from corrosion in the interior, as well as the exterior of the rope, and gives a greater compactness and elasticity than is found in any other manufacture.

Many of these ropes have been in constant operation in the different mines in England, and on the Blackwall and other inclined planes, for three and four years, and are still in good condition.

They have been applied to almost every purpose for which hempen ropes have been used—mines, heavy cranes, standing rigging, window cords, lightning conductors, signal halyards, tiller ropes, etc. Reference is made to the annexed statement for the relative strength and size. Testimonials from the most eminent engineers in England can be shown as to their efficiency, and any additional information required respecting the different descriptions and application will be given by

ALFRED L. KEMP,  
75 Broad street, New York, sole agent in the United States.

Statement of Trial made at the Woolwich Royal Dock Yard, of the Patent Wire Ropes, as compared with Hempen Ropes and Iron Chains of the same strength.—October, 1841.

WIRE ROPES.			HEMPEN ROPES.			CHAINS.		STRENGTH Tons.
Wire gauge number.	Circumference of rope.	Weight per fathom.	Circumference of rope.	Weight per fathom.		Weight per fathom.	Diameter of iron.	
	INCH.	LBS. OZ.	INCH.	LBS. OZ.		LBS.	INCH.	
11	4½	13 5	10	21 —		50	15-16	20
13	3½	8 3	8½	16 —		27	11-16	13½
14	3½	6 11	7½	12 8		17	9-16	10½
15	2½	5 2	6½	9 4		13½	1-2	7½
16	2½	4 3	6	8 8		10½	7-16	7

N.B. The working load, with a perpendicular lift, may be taken at 6 cwt. for every lb. weight per fathom, so that a rope weighing 5 lbs. per fathom would safely lift 3360 lbs., and so on in proportion. 1y24

## BOSTON AND PROVIDENCE RAILROAD.

Passenger Notice. Summer Arrangement. On and after Monday, Sept. 28, 1846, the Passenger Trains will run as follows:

For New York—Night Line, via Stonington. Leaves Boston every day, but Sunday, at 5 p.m.

Accommodation Trains, leave Boston at 7 1/2 a.m. and 3 1/2 p.m., and Providence at 8 a.m. and 3 1/2 p.m.

Dedham trains, leave Boston at 9 a.m.; 3 p.m., 5 1/2 p.m., and 10 1/2 p.m. Leave Dedham at 8 a.m. and 4 1/2 and 9 p.m.

Stoughton trains, leave Boston at 11 1/2 a.m. and 4 1/2 p.m. Leave Stoughton at 8 a.m. and 3 1/2 p.m. All baggage at the risk of the owners thereof.

W. RAYMOND LEE, Sup't.

BRANCH RAILROAD AND STAGES CONNECTING with the Boston and Providence Railroad.

Stages connect with the Accommodation trains at the Foxboro' Station, to and from Woonsocket. At the Seekonk Station, to and from Lonsdale, R. I. via Pawtucket. At the Sharon Station, to and from Walpole, Mass. And at Dedham Village Station, to and from Medford, via Medway, Mass. At Providence, to and from Bristol, via Warren, R. I.—Taunton, New Bedford and Fall River cars run in connection with the accommodation trains.

## BOSTON AND MAINE RAILROAD.

Upper Route, Boston to Portland via, Reading, Andover, Haverhill, Exeter, Dover, Great Falls, South & North Berwick, Wells, Kennebunk and Saco.

Winter Arrangement, 1846-7.

On and after October 5th, 1846, Passenger Trains will leave daily, (Sundays excepted,) as follows: Boston for Portland at 7 1/2 a.m. and 2 1/2 p.m.

Boston for Great Falls at 7 1/2 a.m., 2 1/2 and 3-25 p.m.

Boston for Haverhill at 7 1/2 and 11 1/2 a.m., 2 1/2, 3-25 and 5 p.m.

Boston for Reading at 7 1/2 and 11 1/2 a.m., 2 1/2, 3-25 and 6 1/2 p.m.

Portland for Boston at 7 1/2 a.m., and 3 p.m.

Great Falls for Boston at 6 1/2 and 9 1/2 a.m., and 4 1/2 p.m.

Haverhill for Boston at 7 1/2, 8 1/2, and 11 a.m. and 3 and 6 1/2 p.m.

Reading for Boston at 7, 8 1/2 and 9 1/2 a.m., 12 m., 1 1/2, 4 and 7 1/2 p.m.

The Depot in Boston is on Haymarket Square.

Passengers are not allowed to carry Baggage above \$50 in value, and that personal Baggage, unless notice is given, and an extra amount paid, at the rate of the price of a Ticket for every \$500 additional value.

CHAS. MINOT, Super't.

## THE BEST RAILROAD ROUTE TO THE

Lake and Buffalo, from Cincinnati.

Take Cars to Xenia, 65

miles; take Stage to Mansfield, 88 miles; thence by Cars to Sandusky, 56 miles to the Lake; thence Steamboat to Buffalo, 230 miles.

Fare from Cincinnati to Sandusky.....\$8 00

" " Sandusky to Buffalo, Cabin..... 6 00

" " " " " Steerage.... 4 50

Fare by this route, although the cheapest across the state, will be reduced in a short time, railroad lengthened, and speed increased.

Leave Cincinnati in the morning, arrive at Columbus at night.

Leave Columbus in the morning, arrive at Sandusky same day.

Leave Sandusky, by Boat, in the morning, arrive at Buffalo next morning in time for the Cars north and east for Niagara Falls, Canada, Saratoga Springs, Troy, Albany, Boston, New York, Washington, or Philadelphia.

Passengers should not omit to pay their fare through from Cincinnati to Sandusky, or from Columbus to Sandusky via Mansfield; as this route is the only one that secures 56 miles [this road is run over in 2h. 50m.] most railroad which is new, and is the shortest, cheapest and most expeditious across the state.

Fares on the New York railroads are about to be reduced.

B. HIGGINS, Sup't, etc.  
Sandusky, Ohio. M. & S. C. R. R. Co.

## SUMMER ARRANGEMENT.—NEW YORK

AND ERIE RAILROAD LINE, from April

1st until further notice, will

run daily (Sundays excepted) between the city of New York and Middletown, Goshen, and intermediate places, as follows:

FOR PASSENGERS—

Leave New York at 7 A. M. and 4 P. M.

" Middletown at 6 1/2 A. M. and 5 1/2 P. M.

FARE REDUCED to \$1 25 to Middletown—way in proportion. Breakfast, supper and berths can be had on the steamboat.

FOR FREIGHT—

Leave New York at 5 P. M.

" Middletown at 12 M.

The names of the consignee and of the station where to be left, must be distinctly marked upon each article shipped. Freight not received after 5 P. M. in New York.

Apply to J. F. Clarkson, agent, at office corner of Duane and West sts. H. C. SEYMOUR, Sup't, March 25th, 1846.

Stages run daily from Middletown, on the arrival of the afternoon train, to Millford, Carbondale, Honesdale, Montrose, Towanda, Owego, and West; also to Monticello, Windsor, Binghamton, Ithaca, etc., etc. Agent on board. 13 d

## NORWICH AND WORCESTER RAILROAD.

Road. Summer Arrangement, commencing

Monday, April 6, 1846.

Accommodation Trains, daily,

except Sunday. Leave Norwich, at 6 a.m., and 4 p.m. Leave Worcester, at 10 a.m., and 4 1/2 p.m.

The morning Accommodation Trains from Norwich, and from Worcester, connect with the trains of the Boston, and Worcester and Western railroads each way.

The Evening Accommodation Train from Worcester connects with the 1 1/2 p.m. train from Boston.

New York Train via Long Island Railroad.

Leave Allyn's Point for Boston, about 1 p.m., daily, except Sunday.

Leave Worcester for New York, about 10 p.m., stopping at Webster, Danielsonville, and Norwich.

New York Train via Steamboat—Leave Norwich for Boston, every morning, except Monday, on the arrival of the steamboat from New York, stopping at Norwich and Danielsonville.

Leave Worcester for New York, upon the arrival of the train from Boston, at about 4 1/2 p.m., daily, except Sunday, stopping at Webster, Danielsonville and Norwich.

Freight Trains daily each way, except Sunday.—Special contracts will be made for cargoes, or large quantities of freight, on application to the superintendent.

Fares are Less when paid for Tickets than when paid in the Cars. J. W. STOWELL, Sup't.

**TROY RAILROADS.—IMPORTANT NOTICE.**

Troy and Greenbush Railroad, forming a continuous track from Boston to Buffalo and Saratoga Springs.

This road is new, and laid with the heaviest iron H rail. Trains will always be run on this road connecting at Greenbush each way with the trains to and from Boston and intermediate places, leaving Greenbush daily at 1 p.m. and 6 p.m., or on arrival of the trains from Boston; leave Troy at 7 a.m. and 4 p.m., or to connect with trains to Boston.

Trains also run hourly on this road between Troy and Albany. Running time between Greenbush and Troy, 15 minutes.

**TROY AND SCHENECTADY RAILROAD.**

This road is laid its entire length with the heaviest H rail— which is not the fact with the road from Albany. Trains will always be run on this road connecting each way, to and from Buffalo and intermediate places. Leave Troy for Buffalo at 7 a.m. and 1 p.m. and 6 p.m., or to connect with the trains for the west; leave Schenectady at 2 a.m., 8 a.m., 1 p.m. and 3 p.m., or on arrival of the trains from Buffalo and intermediate places.

**TROY AND SARATOGA RAILROAD.**

THE ONLY DIRECT ROUTE.

No change of passenger, baggage or other cars on this route. Cars leave Troy for Ballston, Saratoga Springs, Lake George and White Hall at 7 a.m., (arriving one hour in advance of the train from Albany,) and at 3 p.m. Returning, leave Saratoga at 9 a.m. and 3 p.m., (reaching Troy in time for the evening boats to New York.) Cars also leave Troy for the Burrough at 3 p.m. and 7 p.m., connecting with packet boats for the north. This takes passengers from New York and Boston to Montreal in 44 hours.

N.B. Travellers will find the routes through Troy most convenient and economical, and as expeditious as any other. The steamboats to and from New York land within a few steps of the railroad office, and passengers are taken up and landed by the different railroad lines at the doors of principal hotels, thus saving all necessity for, and annoyance from, hack drivers, cabmen, runners, etc.

Aug 3, 1846.

1y 32

**BALTIMORE AND OHIO RAILROAD.**

MAIN STEM. The Train carrying the

Great Western Mail leaves Baltimore every morning at 7 a.m. and

Cumberland at 8 o'clock, passing Milcott's Mills, Frederick, Harpers Ferry, Martinsburgh and Hancock, connecting daily each way with the Washington Trains at the Relay House seven miles from Baltimore, with the Winchester Trains at Harpers Ferry—with the various railroad and steamboat lines between Baltimore and Philadelphia and with the lines of Post Coaches between Cumberland and Wheeling and the fine Steamboats on the Monongahela Slack Water between Brownsville and Pittsburgh. Time of arrival at both Cumberland and Baltimore 5 1/2 P. M. Fare between those points \$7, and 4 cents per mile for less distances. Fare through to Wheeling \$11 and time about 36 hours, to Pittsburgh \$10, and time about 32 hours. Through tickets from Philadelphia to Wheeling \$13, to Pittsburgh \$12. Extra train daily except Sundays from Baltimore to Frederick at 4 P. M., and from Frederick to Baltimore at 8 A. M.

**WASHINGTON BRANCH.**

Daily trains at 9 A. M. and 5 P. M. and 12 at night from Baltimore and at 6 A. M. and 5 P. M. from Washington, connecting daily with the lines North, South and West, at Baltimore, Washington and the Relay house. Fare \$1 60 through between Baltimore and Washington, in either direction, 4 cents per mile for intermediate distances. s13yl

**THE SUBSCRIBER IS PREPARED TO** execute at the Treaton Iron Works, orders for Railroad Iron of any required pattern, and warranted equal in every respect in point of quality to the best American or imported Rails. Also on hand and made to order, Bar Iron, Braziers' and Wire Rods, etc., etc.

PETER COOPER 17 Burling Slip.

1y10

New York.

**NEW RAILROAD ROUTE FROM BUFFALO TO CINCINNATI.**

Passengers destined for:

Columbus and Cincinnati, Louisville, Ky., St. Louis, Mo., Memphis, Tenn., Vicksburg, Natches, New Orleans, and all intermediate ports, will find a new, and the most expeditious and comfortable Route, by taking Steamboats at Buffalo, landing at Sandusky City, Ohio, distance..... 230 miles.

From thence by Cars, over the Mansfield Railroad which is new and just opened [laid with heavy iron,] to Mansfield, distance..... 56 "

Thence by Stage via Columbus to Xenia over gravel and Macadamized Road, (the best in the state,) in new coaches, distance..... 88 "

Thence, over the Little Miami Railroad, from Xenia to Cincinnati, distance.... 65 "

**TIME.**

From Buffalo to Sandusky..... 24 hours.  
Leave Sandusky 5 a.m. to Columbus.... 14 "  
From Columbus to Cincinnati..... 15 "

Or say 30 hours from Sandusky to Cincinnati over this route, including delays.

**FARE.**

From Buffalo to Sandusky, Cabin.....\$6 00  
" " " Steerage..... 3 00  
" Sandusky to Columbus..... 4 50  
" " through to Cincinnati..... 8 00

Passengers should not omit to pay their fare through from Sandusky City to Cincinnati and take receipts availing themselves of the benefit of a contract existing between the said Railroad and Stage Co's, securing 121 miles travel by good Railroad and 88 miles by Stage, in crossing from Lake Erie to the Ohio river, in the space of 3 hours.

Passengers destined for St. Louis, or any point below on the Mississippi, will save by taking this route, from 4 to 6 days time and travel, and nearly half the expense, over the Chicago and Peoria route to the above places.

Fare by this route, although the cheapest, will in a short time be reduced, Railroad lengthened, and speed increased.

B. HIGGINSON, Sup't, etc.

M. & S. C. R. R. Co.

Sandusky City, Ohio.

**NEW YORK & HARLEM RAILROAD CO.—Winter Arrangement.**

On and after Monday, November 23, 1846, the cars will run as follows:

Leave 27th street for 42d street, Deaf and Dumb Institute, Yorkville, Harlem, Morrisania, and Williams' Bridge, at 7 o'clock a.m. From City Hall for above named places, 2 p.m. [freight train,] 2 30 p.m. 5 p.m. to Morrisania only.

Leave City Hall for Harlem, Morrisania, Fordham and Williams' Bridge, at 7 45 a.m., and 10 45 a.m.; 1 15 p.m., 2 p.m. [freight train,] 2 30 p.m. and 3 45 p.m.

Leave City Hall for Hunt's Bridge, Bronx, Tuckahoe, Hart's Corners, White Plains, Davis' Brook, Unionville and Pleasantville, [Pleasantville 4 miles from Sing Sing,] 7 45 and 10 45 a.m.; 1 15 p.m., 2 p.m. [freight train,] and 3 45 p.m.

**RETURNING.**

Leave Pleasantville, at 8, 10, [freight train,] and 11 a.m.; 1 30, and 4 p.m.

Leave White Plains, at 8 12, 10 30, [freight train] and 11 20 a.m.; 1 50, and 4 20 p.m.

Leave Tuckahoe, 8 35, 10 55, [freight train,] and 11 35 a.m.; 2 05, and 4 35 p.m.

Leave Williams' Bridge at 7 45, 8 50 and 11 50 a.m.; 2 10, 4, and 4 50 p.m.

Leave Morrisania 8 and 9 05 a.m.; 12 05, 2 35, 4 20, 5 05 and 6 p.m.

Leave Yorkville, at 8 12 a.m.; 4 35 and 6 15 p.m.

**SUNDAY ARRANGEMENTS.**

Leave City Hall for Pleasantville and intermediate places, at 7 45 a.m.; 1 15 and 3 p.m.

Leave Pleasantville for City Hall, at 8 a.m.; 11, and 3 15 p.m.

Leave City Hall for Williams' Bridge and intermediate places, 10 45 a.m.; 2 30 p.m.

Leave Williams' Bridge for City Hall, at 8 50 and 11 50 a.m.; 1, 3 45 and 4 05 p.m. 1y42

Fare from Baltimore to Charleston.....\$31 00  
" " " Richmond..... 6 60

For Tickets, or further information, apply at the Southern Ticket Office, adjoining the Washington Railroad Office, Pratt street, Baltimore, to 1v11

**STOCTON & FALLS, Agents.**  
**RAILROAD SCALES.—THE ATTENTION** of Railroad Companies is particularly requested to Ellicott's Scales, made for weighing loaded cars in trains, or singly, they have been the inventors, and the first to make platform scales in the United States; supposing that an experience of 20 years has given a knowledge and superior advantage in the business.

The levers of our scales are made of wrought iron, all the bearings and fulcrums are made of the best cast steel, laid on blocks of granite, extending across the pit, the upper part of the scale only being made of wood. E. Ellicott has made the largest Railroad Scale in the world, its extreme length was one hundred and twenty feet, capable of weighing ten loaded cars at a single draft. It was put on the Mine Hill and Schuylkill Haven Railroad.

We are prepared to make scales of any size to weigh from five pounds to two hundred tons.

**ELLICOTT & ABBOTT.**  
Factory, 9th street, near Coates, cor. Melon st.  
Office, No. 3 North 5th street,  
1y25 Philadelphia, Pa.

German or other emigrants, in lots of 20 or more, will be carried over the above roads at 2 cents per mile.

Goods consigned to S. C. Railroad Co. will be forwarded free of commissions. Freight may be paid at Augusta, Atlanta, or Oothcaloga.

J. EDGAR THOMSON,  
Ch. Eng. and Gen. Agent.  
Augusta, Sept. 2d, 1846. \*44 1y

**THE WESTERN AND ATLANTIC** Railroad.—This Road is now in operation to Oothcaloga, a distance of 80 miles, and connects daily (Sundays excepted) with the Georgia Railroad.

From Kingston, on this road, there is a tri-weekly line of stages, which leave on the arrival of the cars on Tuesday, Thursday and Saturday, for Warrenton, Huntsville, Decatur and Tusculumbia, Alabama, and Memphis, Tennessee.

On the same days, the stages leave Oothcaloga for Chattanooga, Jasper, Murfreesborough, Knoxville and Nashville, Tennessee.

This is the most expeditious route from the east to any of these places.

**CHAS. F. M. GARNETT,**  
Chief Engineer.  
Atlanta, Georgia, April 16th, 1846. 1y1

**TO RAILROAD COMPANIES AND MANUFACTURERS** of railroad Machinery. The subscribers have for sale Am. and English bar iron, of all sizes; English blister, cast, shear and spring steel; Juniata rods; car axles, made of double refined iron; sheet and boiler iron, cut to pattern; tiers for locomotive engines, and other railroad carriage wheels, made from common and double refined B. O. iron; the latter a very superior article. The tires are made by Messrs. Baldwin & Whitney, locomotive engine manufacturers of this city. Orders addressed to them, or to us, will be promptly executed.

When the exact diameter of the wheel is stated in the order, a fit to those wheels is guaranteed, saving to the purchaser the expense of turning them out inside.

**THOMAS & EDMUND GEORGE,**  
a45 E. cor. 19th and Market sts., Philad., Pa. 1y

**LITTLE MIAMI RAILROAD.—OPEN** TO SPRINGFIELD—Distance 84 miles—

connecting at Xenia and Springfield with Messrs. Neil, Moore, & Co's. daily daylight lines of stages going east and north, to Columbus, Zanesville, Wheeling, Cleveland, and Sandusky City via Urbana, Bellefontaine, Kenton, and the Mad river and lake Erie railroad, or Columbus, Delaware, and the Mansfield and Sandusky City railroad—forming, by these connections, the cheapest and most expeditious route to Buffalo, Niagara Falls, Rochester, Albany, New York, and Boston.

On and after Thursday, August 13, 1846, until further notice, a Passenger train will run as follows: Leave Cincinnati daily at 9 A. M., for Milford, Foster's Crossing, Deerfield, Morrow, Fort Ancient, Freeport, Waynesville, Spring Valley, Xenia, Old Town, Yellow Springs, and Springfield.

Returning, will leave Springfield at 4 hours 35 minutes A. M. A line of Hacks runs in connection with the Cars, between Deerfield and Lebanon.

FARE—From Cincinnati to Lebanon....\$1 00  
" " " Xenia..... 1 50  
" " " Springfield... 2 00  
" " " Columbus... 4 00  
" " " Sandusky city 8 00

The Passenger trains runs in connection with Strader & Gorman's line of Mail Packets to Louisville.

Tickets can be procured at the Broadway Hotel, Dennison House, or at the Depot of the Company, on East Front street.

Further information and through tickets for the Stage lines, may be procured at P. Campbell, Agent on Front street, near Broadway.

The company will not be responsible for baggage beyond 50 dollars in value, unless the same is returned to the conductor or agent, and freight paid at of a passage for every \$500 in value over that amount.

The 1 P. M. train from Cincinnati, and the 9 40 P. M. train from Xenia, will be discontinued on and after Monday, the 10th instant.

A freight train will run daily.  
47tf W. H. CLEMENT, Sup't.

**PHILADELPHIA, WILMINGTON & BALTIMORE RAILROAD.—1847.**

Winter Arrangement.

Philadelphia for Baltimore... 8 a.m. and 4 p.m.  
Baltimore for Philadelphia... 9 a.m. and 5 p.m.

Connecting in Baltimore with Mail Lines south and west, as per notice of the Baltimore and Ohio Railroad—and with Mail Lines north from Philadelphia, both morning and afternoon.

Sundays, the Morning Lines do not run in either direction.

Accommodation train from Wilmington to Philadelphia, leaves Wilmington at 8 a.m., and returns at 9 p.m.

J. R. TRIMBLE,  
2tf Engineer and General Superintendent.

**LAWRENCE'S ROSENDALE HYDRAULIC** Cement. This cement is warranted equal to any manufactured in this country, and has been pronounced superior to Francis' "Roman." Its value for Aqueducts, Locks, Bridges, Floors and all Masonry exposed to dampness, is well known, as it sets immediately under water, and increases in solidity for years.

For sale in lots to suit purchasers in tight papered barrels, by **JOHN W. LAWRENCE,**  
142 Front street, New York.

Orders for the above will be received and promptly attended to at this office. 32 1y

**SPRING STEEL FOR LOCOMOTIVES,** Tenders and Cars. The Subscriber is engaged in manufacturing Spring Steel from 1 1/2 to 6 inches in width, and of any thickness required: large quantities are yearly furnished for railroad purposes, and wherever used, its quality has been approved of. The establishment being large, can execute orders with great promptitude, at reasonable prices, and the quality warranted. Address

**JOAN F. WINSLOW, Agent,**  
Albany Iron and Nail Works,

**VALUABLE PROPERTY ON THE MILL Dam For Sale.** A lot of land on Gravelly Point, so called, on the Mill Dam, in Roxbury fronting on and east of Parker street, containing 68,497 square feet, with the following building: thereon standing.

Main brick building, 120 feet long, by 46 ft wide two stories high. A machine shop, 47x43 feet, with large engine, face, screw, and other lathes, suitable to do any kind of work.

Pattern shop, 35x32 ft. with lathes, work benches.

Work shop, 86x35 feet, on the same floor with the pattern shop.

Forge shop, 118 feet long by 44 feet wide on the ground floor, with two large water wheels, each 11 feet long, 9 ft diameter, with all the gearing, shafts, drums, pulleys, &c., large and small trip hammers, furnaces, forges, rolling mill, with large balance wheel and a large blowing apparatus for the foundry.

Foundry, at end of main brick building, 60x45 ft, two stories high, with a shed part 45x20 feet, containing a large air furnace, cupola, crane and corn oven.

Store house—a range of buildings for storage, etc., 200 feet long by 20 wide.

Locomotive shop, adjoining main building, fronting on Parker street, 54x25 feet.

Also—A lot of land on the canal, west side of Parker st., containing 6000 feet, with the following buildings thereon standing:

Boiler house 50 feet long by 30 feet wide, two stories.

Blacksmith shop, 49 feet long by 20 feet wide.

For terms, apply to HENRY ANDREWS, 48 State st., or to CURTIS, LEAVENS & CO., 106 State st., Boston, or to A. & G. RALSTON & Co., Philadelphia. ja4

**TO RAILROAD COMPANIES AND BUILDERS OF MARINE AND LOCOMOTIVE ENGINES AND BOILERS.**

#### PASCAL IRON WORKS.

#### WELDED WROUGHT IRON TUBES

From 4 inches to 1 in calibre and 2 to 12 feet long, capable of sustaining pressure from 400 to 3500 lbs. per square inch, with Stop Cocks, T's, L's, and other fixtures to suit, fitting together, with screw joints, suitable for STEAM, WATER, GAS, and for LOCOMOTIVE and other STEAM BOILER Tubes.

Manufactured and for sale by  
**MORRIS, TASKER & MORRIS.**  
Warehouse S. E. Corner of Third & Walnut Streets,  
**PHILADELPHIA.**

#### PATENT INDESTRUCTIBLE WATER

Pipes. The subscribers continue to manufacture the above Pipes, of all the sizes and strength required for City or Country use, and would invite individuals or companies to examine its merits.—This pipe, unlike cast iron and lead, imparts neither color, oxide or taste, being formed of strongly riveted sheet iron, and evenly lined on the inside with hydraulic cement. While in the process of laying, it has a thick covering externally of the same—thus forming nature's own conduit of stone. The iron being thoroughly enclosed on both sides with cement, precludes the possibility of rust or decay, and renders the pipe truly indestructible. The prices are less than those of iron or lead. We also manufacture Basins and D. Traps, for Water Closets, on a new principle, which we wish the public to examine at 113 Fulton street, New York.

J. BALL & CO.

#### TO LOCOMOTIVE AND MARINE EN-

gine Boiler Builders. Pascal Iron Works, Philadelphia. Welded Wrought Iron Flues, suitable for Locomotives, Marine and other Steam Engine Boilers, from 2 to 5 inches in diameter. Also, Pipes for Gas, Steam and other purposes; extra strong Tube for Hydraulic Presses; Hollow Pistons for Pumps of Steam Engines, etc. Manufacture: and for sale by

**MORRIS TASKER & MORRIS,**  
Warehouse S. E. corner 3d and Walnut Sts., Philadelphia.

## NORRIS' LOCOMOTIVE WORKS.

BUSH HILL, PHILADELPHIA, Pennsylvania.

**MANUFACTURE** their Patent 6Wheel Combined and 8 Wheel Locomotives of the following descriptions, viz:

Class 1,	15 inches	Diameter of	Cylinder,	×	20 inches	Stroke.
" 2,	14	"	"	"	×	24 " "
" 3,	14½	"	"	"	×	20 " "
" 4,	12½	"	"	"	×	20 " "
" 5,	11½	"	"	"	×	20 " "
" 6,	10½	"	"	"	×	18 " "

With Wheels of any dimensions, with their Patent Arrangement for Variable Expansion. Castings of all kinds made to order: and they call attention to their Chilled Wheels, for the Trucks of Locomotives, Tenders and Cars.

**NORRIS, BROTHERS.**

#### THE NEWCASTLE MANUFACTURING

Company continue to furnish at the Works, situated in the town of Newcastle, Del., Locomotive and other steam engines, Jack screws, Wrought iron work and Brass and Iron castings, of all kinds connected with Steamboats, Railroads, etc.; Mill Gearing of every description; Cast wheels (chilled) of any pattern and size, with Axles fitted, also with wrought tires, Springs, Boxes and bolts for Cars; Driving and other wheels for Locomotives.

The works being on an extensive scale, all orders will be executed with promptness and despatch. Communications addressed to Mr. William H. Dobbs, Superintendent, will meet with immediate attention.

**ANDREW C. GRAY,**  
a45 President of the Newcastle Manuf. Co.

## THE NEW RAILWAY TRACK.

The Baltimore and Ohio railroad company have, within the past week, completed the reconstruction of 30 miles of their railway east of Harper's Ferry, having substituted for that distance a substantial track, similar to the track west of that place, and laid with a rail of 51 lbs. to the yard, for the former plate rail of 15 lbs. per yard. The heavy and rapidly increasing trade of the road, had, as is well known, some time since rendered this change in the character of the structure admissible and indeed necessary, and it has now, to this extent, been accomplished, and with great relief to the portion of the line on which the light rail still remains. This part is now reduced to some 31 miles, which, when replaced, as is proposed, by the improved track, will make an unbroken line of heavy rail from Baltimore to Harper's Ferry. The new track just finished begins at Harper's Ferry and extends eastward to the Monocacy, 23½ miles. The remaining 6½ miles of the 30 is in three detached sections on this side the Monocacy, laid at points where they are calculated to be of the greatest service until the entire line of the old track shall be rebuilt. We are informed that the time occupied in the construction of the new road has been about eight months from the first delivery of materials—being at the rate of something less than a mile a week. The circumstance which limited the advance of the work, was the delivery of the iron rails; and it is with pride and pleasure we state, that this most important and expensive portion of the structure, hitherto drawn from abroad, was manufactured upon the very line of the road itself. The weight of iron used was about 2450 tons—one-half of which was rolled at Mount Savage, 9 miles from Cumberland; and the other half at the Avalon works, a similar distance from Baltimore. The castings and bolts were also of Baltimore manufacture, and, with the exception of the sawed timber, which came chiefly from the Susquehanna, and the spikes, which were made at Troy, N. Y., all the materials of the new road were of growth and manufacture indigenous to our State and city.

The track, we learn, was opened for use in short sections, as finished, so that the benefit of it has been partially and increasingly experienced since August last. The last section was passed over by the trains but four days after the last parcel of rails left the rolling mill—showing that no time was lost in availing of the advantages of the new structure. The deranged state of the old road required that the new should be thus brought into active use as fast as possible, and thus it was subjected to the immediate action of a very heavy trade, in a raw and uncompacted condition. The excessive rains of the past season had also kept the bed of the road, which at that part of the line consists chiefly of a stiff clay soil tenacious of water, in an unsettled state. These circumstances, united to the speed at which the trains were driven over the new track, in the irrepressible pleasure on the part of the engineers and conductors of changing it for the old one, caused

a good deal of derangement at first in the improved railway. This, however, we are happy to learn, is now remedied, and the track brought, for the most part, into good adjustment, which will continue to improve until the soil shall become thoroughly compacted under the new work.

The new track has been laid, we understand, at a cost less than the estimated expense, although for the iron rails higher prices have been paid than were therein contemplated.

The effects of this improvement are already manifested in the more early and regular arrival of the trains at both ends of the road, and they will be further felt in the reduction of expense in the maintenance of the road and machinery, and the increased safety and comfort of the travellers passing over the line. All these results will tell profitably in their effects upon the traffic and revenue of the road, and the wisdom of the measure of reconstruction will thus be made apparent, and its further prosecution to entire completion will be demonstrated.—*Patriot*.

## FORMATION OF COAL.

An account was given in the Evening Post, a few days ago, of the discovery at a considerable depth below the surface of the earth, in a process of transmutation into coal, of what was evidently once a mere log of wood. It was found by some persons engaged in making excavations, after they had passed through several layers of gravel, etc., firmly embedded in a thick stratum of clay. A small portion of it had, to all appearances, become coal, while other parts were as yet entirely wood, and others again in a state of partial transition. The last, on the application of fire, burned alike, but a little more rapidly than ordinary bituminous coal, emitting a similar smoke and odor. A specimen was presented to the editor of the Post, and said by him to be highly worth examination. This furnishes another and a rare proof of the correctness of the theory of the vegetable origin of coal.

Indeed, the assignment of this origin has come to be no longer considered a doubtful hypothesis; and the question now agitated is mainly as to the cause and manner of such immense conglomerations of vegetable matter as must have been necessary to the vast formations almost every year discovered. In the opinion of some, the deposits were made by great masses of the inconceivably luxuriant vegetation of the carboniferous era floating down the rivers until vast natural rafts were accumulated in the estuaries, which finally sunk, and after lying at the bottom and receiving fresh accessions of wood and earthy matter, for a long period of time, were finally by volcanic convulsions elevated above the waters. Others suppose the mines to have been gradually generated by the decaying and sinking of forests in marshy places, which first formed vast beds of a substance resembling peat, and afterwards passed completely into coal. There are many facts tending to support the latter supposition—as the discovery in a state of singular preservation, of animals, lost in such peat marshes generations ago—

There are also many facts confirmatory of the first hypothesis. Probably we should not much err in attributing the coal formations to both these agencies. The existence of sufficiently great forests to compose these formations, becomes readily credible, when we reflect upon the undoubted presence in the atmosphere of that era, of a remarkably large amount of carbonic acid gas—the direct effect of which would be destructive of animal life, (few or no traces whereof are accordingly found) but amazingly favorable to the growth of the vegetable kingdom. The whole earth must have been covered by one great wood. However, as we do not here intend an essay upon the subject, we cut it short off.—*Eureka*, for January.

## The Oregon Railroad Compared.

The subject of the Oregon Railroad, it is very well known, has, for a long time, been before the public, and our readers are aware, of course, that two plans have been presented to the people, for the route to the Pacific. Mr. Whitney presents one scheme, and Mr. Wilkes another—both of which have their friends. It is not, however, so generally understood what the schemes are, in detail—and it is evident that the public mind is not yet prepared to decide which is the most feasible, or practicable.—For the information of those interested, a late number of the New York Globe, publishes the following particulars in reference to both routes, which may serve to throw some additional light upon the subject:

MR. WHITNEY proposes, 1st. To construct the road himself, and to start from the lower point of Lake Michigan, on the eastern border of Illinois. 2d. He asks the government to give him a stretch of the public domain 60 miles in width, from that point to the Pacific Ocean, which he agrees to sell to obtain the means to build the road. 3d. The road to belong to him and his associates for the first twenty years after its completion, and afterwards to the government, "unless his associates or their successors" shall then conclude to pay the government 16 cents the acre for the granted land.

LIEUT. WILKES proposes, on the other hand, 1st. That the work shall be national, and that it be built and owned by the government.—2d. That its construction and control be confided to sworn commissioners selected by the State Legislatures, or by the people of the several states. 3d. That it start from the Missouri river, and run thence westwardly over the territories of the general government. 4th. That its revenues and tolls be kept down to the measure of its current expenses. 5th. That it be open to foreigners and their merchandize on the same terms as to our own citizens, with the exception of mere debenture fees on foreign freight. 6th. That it be built out of the public treasury, and that no special allotment of the contiguous public lands be made, except in favor of the laborers and mechanics on the road—it being recommended that each man who has worked one year upon it, receive, in addition to his usual wages, a reward of 80 or 100 acres, as a farm to settle on.

These are the two plans. They are both for the second time before the Congress of the nation, and the people can take their choice between them.

**American Locomotives in England.**

A correspondent of the Philadelphia Saturday Courier, writing from abroad, furnishes the following a title, which we commend to perusal:

Finding letters here, he says, which required me to go to Bristol, I took an omnibus for the railway station from which started the train for Gloucester, distance 53 miles, fare four shillings, time one hour and forty minutes. Having a little time to spare before the train set off, I went forward to see the locomotive, and was surprised to see on it in large gilt letters, "Philadelphia;" on another, "New York." This induced me to ask of the engineer if they were of American make, informing him I was an American, and was going in the train. He said they were made in Philadelphia by Mr. Norris; that 18 had come out, and fine little *Yankee horses* they were—could beat the London train, give them the start of a mile, and pass them with ease. The driving wheels of the English locomotives are five and a half feet in diameter—those of the American were but three feet, and I mentioned it to the engineer.

"Ah, never mind that," replied he—"you will soon see how she streaks it!"

The bell striking, I took my seat with a gentleman and two young ladies, his daughters from Yorkshire, who were also going to Gloucester. I informed them I was an American, which I found was a good introduction, as is the case now all through England, and tends at once to lead to some inquiry as regards the United States, and will in many instances, as it has done, create friends, which have proved very advantageous to the stranger while abroad. We were proceeding at a very rapid rate, and as the gentleman and myself had been conversing on the great improvements of the age, on which he placed all to the credit of the English mechanics, and how much America was indebted to England for most of the vast improvements in which that country was at the time engaged, he suddenly and familiarly placed his hand upon my knee, and asked with a smile if we could travel at the rapid rate we were then going, on the railroads in America, and finished by observing loudly,

"England—England, before all the world for locomotives and railroads."

"Yes," observed one of the daughters—"what would the world do without our little island, for people seem to come from all parts of the world to purchase their pins, needles, etc., and"—

"Bless me," cried out her sister, "we shall most certainly all be killed, if we go so fast; do, father, speak to the agent, and"—

"Killed, indeed," quickly observed the father, with a loud laugh of seeming exultation; "English locomotives are like English blood horses; when once warm there is no stopping them; what say you, my friend?" again squeezing my hand with a knowing inquisitive look.

"Only my dear sir, that the locomotive now drawing us at such fearful speed, was made in the United States—that is all," replied I bowing.

A loud laugh from the Yorkshireman and his daughters, followed my remark.

"Well said, well said—a good joke, indeed! An American locomotive on an English railway! ha! ha! ha! But my dear sir, excuse me," continued the gentleman—"but I cannot help laughing to see you look so very sedate, as if you really meant what you said."

"I do mean it, my dear sir," I replied—"and will repeat the assertion, and on our arrival at the station at Gloucester, will also convince you of a fact, which you seem to doubt, and treat with ridicule."

The national pride of the Yorkshire merchant was roused, and silently opening a large pocket book, took out a note of £100 saying,

"Excuse me, sir, but I am so positive that you are under some mistake, or have been misinformed, that I will place this sum against £5, merely for the joke's sake, that it is not so."

The whistle from the engine at that moment sounded, and the next moment we were at the station. After handing the ladies out, I observed to the father, smiling, if he would accompany me, I would convince him of the truth of my assertion. The daughters also joined us, to see if there was no mistake, and the passengers, hearing what had been asserted, followed as unbelievers.

There stood the little puffing *Yankee iron horse* with its keeper along side, and the blazing letters, "Philadelphia," on its side.

All seemed astonished, and many inquiries were made of the agent, who, observing their surprise, said with a laugh:

"Why, the company sent over to America for twenty at one order; we have a dozen on the road, and hope soon to have such fine little fellows on all the roads in England, for they go *ahad* and no mistake, like those who make them."

All ended with a laugh. The Yorkshire merchant insisted on my dining with him at the hotel; and in the afternoon I accompanied his daughters through the city to make calls and some purchases. Their father presented me with his card at parting, with a hope, if I returned through Sheffield, not to fail in finding him out, commanding his services, etc.

**Items from English Papers.**

The following items, from late English Journals, will be found interesting.

**Improved Wheels and Axles for Railway Engines and Carriages.**—Mr. Edge, of Manchester, has recently patented some improvements applicable to the wheels and axles of engines, tenders, carriages and wagons, to be used upon railways, and which are intended to be adopted in such cases, where the wheels are mounted upon revolving axles, and are designed to facilitate the transit of carriages over curves or other deviations upon the line of railway. In ordinary locomotive engines, tenders, carriages or wagons, used on railways, the wheels are both "staked," keyed or fastened upon their respective axles, and, consequently, both wheels revolve with the axles, while running; and, as is well known, in the event of passing over curves in the line, their action is not uniform, but subject to considerable friction and abrasion or "twist" against one side of the rails. This

invention consists in so constructing wheels and axles as to obviate this imperfection. The improvement is effected by "staking," keying or fixing only one wheel upon the revolving axle, instead of both, and leaving the other wheel loose upon its axis, and at liberty to turn, slip, or even remain for a time quiescent, when occasion may require.

**Croydon Atmospheric Railway.**—The same sealing composition which was used for closing the longitudinal valve during the extreme heat of last summer, has passed through its first freezing ordeal with great success. Many persons prognosticated that a contrary result would ensue. The trains since Monday were all run with the greatest punctuality, and the valve composition appeared perfectly soft and plastic, and wholly unaffected by the frost, though the thermometer at Forest Hill registered between 24 and 25 deg. during the whole of Tuesday and the latter part of Monday evening. Some slight irregularity has occurred, but this was caused by the drivers not knowing (in the absence of instruction,) how to adapt the "pressing wheel" to the altered state of the temperature, and had no reference to any inefficiency of the apparatus or sealing composition.

**Foreign Iron.**—Very extensive importations of iron are at present taking place, especially from Stockholm, Gothenburg and Gessle, the produce of Sweden: one vessel having brought 10,866, another nearly 14,000, and a third the large quantity of 18,349 bars of the article. Numerous other vessels have arrived from the same places with large cargoes, varying from 5000 to 10,000 bars of the same description of merchandize on board. These large arrivals at the present time may be readily accounted for, in consequence of the great demand for iron to effect the continuation or completion of the vast amount of operations in progress or in embryo throughout the country requiring such description of article for present or stock purposes, with the probability of the demand being still further increased at no very distant period. The iron mines of Sweden are known to be inexhaustible, and to afford ample means for responding to the calls which may be made upon them, and which, indeed, would appear evident from the fact above mentioned.

**Discovery of Copper in Western Australia.**—We have received a communication from Mr. Andrews, the editor of the Swan River News, by which we learn that the discovery of coal in that colony, which we announced about a month since, has been followed by that of copper, which is represented as having been found on the lands of Mr. Davey, of Fremantle: one writer states that he "had seen several specimens, and their solution in acids, of undoubted copper, brought down from the neighborhood of the River Avon." Another report states that "Mr. Davey had discovered copper ore lying on the surface of his land; he had smelted it, and obtained a small portion of copper, but was about to make further investigations when the news left."

**The Turbine.**—We learn from a recent number of an English paper, that a French machine has recently been introduced into use, which operates as a powerful water engine, and denominated the Turbine. It consists of a horizontal wheel, furnished with curved float boards, on which the water presses from a cylinder, which is suspended over the wheel, and the base of which is divided into curved partitions, that the water may be directed in issuing, so as to produce on the corresponding float boards of the wheel its greatest effect. The construction of the machine is simple; its parts not liable to get out of order; and as the action of the water is by pressure the force is under the most favorable circumstances for being utilized. The effective power appears to equal that of the overshot wheel, but accompanied by some conditions which render it peculiarly valuable. In a water wheel you cannot have great economy of power without very slow motion; but in the Turbine, the great economy is accompanied by a rapid motion. If a Turbine be worked with a power of ten horses, and its supply of water be suddenly doubled, it becomes twenty horse power; if the supply be reduced to one-half, it still works five horse power; while such sudden and extreme changes would altogether disarrange water wheels, which can be constructed for the minimum, and allow the overplus to go to waste. By the employment of a close pipe, water is now brought from a distance to several French factories, and there delivered with full force due to the altitude of its source on the Turbine.

#### **Machine for Raising & Lowering Miners.**

—The transactions of the Cornish Polytechnic society, state that the second machine, which has as yet been erected in Cornwall, for lowering and raising the miners, was brought into action at the United Mines in the parish of Gwennap, in the early part of June last. The number of men now being lowered and raised by this machine, is about 450; and of boys, 50; making together, 500 persons.—The average depth to which they are sent is 200 fathoms, which requires between 16 and 17 minutes, and the same time is required to bring them up, making together 34 minutes for the descent and ascent, while by ladders it would be full 65 minutes; thus showing a saving in time of a half hour per day, or in round numbers 150 hours in the year for each person. The clear profit thus derived is found to amount to upwards of £800 per annum, without including in the estimate anything more than the mere difference in time which is gained by the machinery. The cost of the machinery, and the erection of it, exclusive of the engine, which had been provided before, was somewhat less than £2000, it will therefore be repaid within two and a half years. The cost of erecting an engine of sufficient power for working the machinery would be about £1000; but in all cases where the engine can be applied to other purposes, it may be done with advantage, by making it powerful enough to accomplish the additional work which it would be required to perform.

**Mr. Neville's Iron Bridge for Railways.**—Some new tests have recently been applied to the iron bridge invented by Mr. Neville, and erected at the Brussels terminus of the Northern line. The experiments were instituted at the desire of the Belgian government, and were directed by a commission composed of engineers of the state. At first the strength of the bridge was tested by an engine and tender, followed by four wagons laden with 5000 kilogrammes, the weight of the carriages being 25 kil.; after which, another train of the same weight and length, passed over simultaneously with the former, but in an opposite direction, and in such a manner that both should arrive in the centre at the same moment. The next series of tests, consisted in running over the bridge, at first two engines, one after the other on the same line; then four engines, each pair fastened together, and running in contrary directions, meeting in the middle. This experiment was repeated, with the addition of joining to each couple of locomotives, four wagons laden as before. Next, two trains, occupying the whole length of the bridge, were stationed on one of the lines, while a train of two engines and four carriages ran over the other. This was repeated at different rates of speed. After this, while two engines stood on one line, a train, composed as previously, ran on at a great speed, and at the moment of reaching the middle, suddenly stopped. To terminate the experiments, it remained to produce, as nearly as possible, the effect which would arise from a train running off the line. For this purpose the rails were torn up at a part of the line, and disposed so as to produce the desired effect. A wagon, weighing, with its load, 10,000 kil. then ran on at a great speed; and at the entrance to the bridge, the engine which propelled it being withdrawn, the carriage continued its course until it came to the spot where the obstruction had been raised, and then bounded with its whole weight on almost the centre of the bridge. It ran over the bridge, but the shock was so great, that the axles were broken. Not one of these experiments even the last, at all disturbed the mechanism of the structure. Notwithstanding the satisfactory result of these proofs, the government has decided that nothing shall be wanting to ascertain, beyond doubt, the strength of the bridge; and fresh experiments will accordingly be made—one of which is to place a considerable weight on the bridge, which is to remain there a fortnight at least.

**Novel Project in Connection with Railways.**—A combination, or association, of a singular and original character, and embracing various subjects of interest, has lately been conceived, and as we understand, is nearly complete in its construction and arrangements. To make railway touring so pleasant that the traveller may be conveyed anywhere, however distant the point, with the slightest possible care on his mind by the way, or the necessity of troubling himself about any provision for the day or the morrow, the association referred to has been formed. The members, it is said, consist ex-

clusively of hotel keepers; and the servants of their respective establishments, as one of the rules, as reported, is that no servant shall be employed who shall not be interested for a certain number of shares. The company is to be governed by a board of management, composed equally of eight French and eight English directors. Messrs. Horne and Chapin, and Mr. Tyssen (a large landed proprietor, and owner of the Euston square hotels,) are said to be leading members and patrons of the undertaking. By the plan, as proposed, the passenger, from whatever point embraced, has only to state his object, and make the necessary deposit of the sum he may require, or mean to expend, and all the details of his journey are arranged for him. His place by railways and by steamers is secured and fare paid. His passports are taken out *vises en route*, wherever necessary, and his luggage taken care of, passed, re-adjusted whenever requisite, under superintendence of special agents, to whom his circular note is sufficient index, supposing no counterpart of advice. His quarters are provided wherever he may choose to stop at the hotel of correspondence. His bills are paid, and what money he may want, furnished to him. All these conveniences and ease are secured to him, on presentation of the circular note of credit issued to him at the place of departure. The check upon the circular bill of credit is kept of course by a regular mutual course of communication between all points, ending with the board of management in chief, as well as, probably, by a series of endorsements for moneys paid and advanced on account at each place of stoppage. Such, as reported, are the principal outlines of this undertaking, by which a system of paper values promise to be vastly extended (not introduced) over a great part of Europe, where upon the lesser scale, of bank circular notes, it indeed already circulates, without offering, however, anything like the accommodation, or being available for the uses and objects here held out. The necessity for specie or hard money will be materially diminished, by the fact, that people may traverse one-half of Europe freely, with scarcely the obligation of carrying a piece of metallic money, or a bank note. It is not improbable that the conveyance of packages and parcels may be mutually arranged for between the members of the company, by a somewhat similar system of exchanging of orders, to be liquidated by balances as at the banker's clearing house, where £100 coin or notes, is found equal to settle or balance for an aggregate mass of, perhaps, £50,000 of bills variously held for parties for and against each other.

**Waterproofing for Railway Purposes with Vegetable Black.**—It is well known that carbon is a substance less liable to change, from the action of time than almost any other. We have proofs of this in fact, that piles have been found, after immersion for ages in river and morasses, as sound as when placed there, in consequence of having their outer surfaces charred; and in the beauty of the characters traced on the manuscripts discovered at Herculaneum, which are as perfect now as when

written, and of which the coloring matter is ascertained to be carbon. At the present day the most useful black pigments we have are modifications of carbon, more or less impure, and they are principally obtained by the condensation of smoke, generated by the imperfect combustion of substances containing large quantities of carbon: as tar, oil, rosin and the like. The carboniferous products of these are, however, considerably contaminated by foreign matter, which is gasified and passes over with the smoke. These impurities injure the durability of the carbon, and render it needful, in making it into paint, to add sugar of lead, or some similar substance, to act as a drier, and cause the paint to harden. In the case of carbon made from wood, i.e. wood charcoal, the process of carbonizing being carried on at a red heat, the impurities are driven off, and a nearly pure article remains, of an indestructible nature and brilliant black appearance; but hitherto no means have been known of reducing this charcoal to a powder sufficiently fine to be made available for the purposes for which the smoke blacks have been used. The mode of doing so has now, however, been made the subject of a patent by Mr. Jones, of Chester, and the means he employs are these: The great obstacle to minute division of the particles of charcoal in the ordinary mills, arises from the elasticity of the material operated upon, and from the portions reduced to a sufficient state of fineness preventing the abrasion of the remainder, and no sieve is sufficiently fine to make the separation. Mr. Jones grinds his charcoal in a common mill, but causes a gentle current of air to pass through it, by which means as soon as the particles become fine enough to float on that current, they are carried away by it, and are allowed to deposit in a large chamber prepared to receive them. It is evident that the fineness of the powder thus obtained will be in inverse proportion to the strength of the current of the air, and thus any needful degree of minuteness in the atoms may be procured. The purity and fineness of the powder so prepared is such, that it only needs stirring into boiled oil to make at once a brilliant and durable paint.—*Railway Register.*

#### Railroad Advantages.

It has been found that the enormous amount of cattle, sheep, swine, etc., annually sent to, and consumed in, the city of London, can be forwarded by railway, at a great profit over the old system of "driving to market"—and the railroads are now being turned to advantage in this respect.

The following computation will give an idea of the immense amount saved (or gained) yearly by the adoption of the railway for conveyance.

The number of fat cattle annually sent to market is... 220,000—loss in driving... 8,800,000 lbs.  
Sheep... 1,250,000 " " ... 10,000,000 lbs.  
Swine... 550,000 " " ... 5,500,000 lbs.

Total..... 24,300,000 lbs.

"As the grazing districts," says an English paper, "are mostly in the north of England and Scotland, the average distance which these animals have been driven to market before the introduction of railways, was something over 100 miles. Long experience has demonstrated the fact that the loss in driving

beasts was equal to 40 pounds of beef per head; on sheep 8 pounds; on swine 10 pounds per head."

The time saved in sending these fattened animals to London by railway, instead of at the snail's pace on foot, is said to be more than an equivalent for the expense of their freight, so that the community really gains annually *twenty-four million three hundred thousand pounds of good meat for nothing*. In a market where meat is worth an average of ten cents a pound, and scarce at that, the saving can be regarded in no other light than as a great public blessing.

"The above," adds an exchange, "is only the beginning of blessings in the item of meat alone, which these iron ways are destined to confer on the denizens of the vast metropolis. The abominable nuisance of Smithfield market is at last to be abated.—Slaughtering establishments are going into successful operation in the country, on the lines of railways, so that the meat can be easily taken into the city, and the offal and other matters that should go to make most valuable manure, are left close to the broad acres that require fertilizing. The monopoly of Smithfield is soon to die, to the joy and gain of millions. The healthfulness of London will soon be greatly improved by cleansing it, and sending off on railroads the accumulated filth of ages. Thousands of shopkeepers, artisans, brokers, professional men, and others, are procuring residences for their families on the lines of the many railways, ten, twenty, or thirty miles out of the noise, dust, smoke and pestilence of the great Babel. One railway company is building a village of 800 dwellings at one of its depots. As the population of England increases rapidly, and especially that of London, we see no reason why the city may not one day cover half the island with its suburban villas.

Railroads in this country have as yet done very little in the way of bringing country people with their produce into cities to trade. The directors keep the fare so high that very few farmers can afford to send fat cattle, sheep or hogs by railway to market. The public interests are less than half served, even in the matter of travelling, by reason of the fact that comparatively but few men feel able to pay the prices charged for carrying them on these roads. An auspicious change will soon be made. The roads will be greatly improved and better adapted for carrying heavy trains. They will diminish their present rates one half and quadruple their business. A railway from this city extending to the head-waters of the Susquehanna will bring a large amount of trade from that extensive district. It will lessen the expense of living here, by increasing our supply of fuel, meat, butter and cheese, as well as adding largely to the customers of our merchants, mechanics and manufacturers. Our business men should remember the economical maxim of Dr. Franklin: "God helps those that help themselves." It is in the spirit of the sound business maxim, that the people of Buffalo have taken the stock of the Attica and Hornellsville railroad, with a determination to construct the same. If we will not aid in offering all needful facilities for the rural population of the surrounding country to come here to market, of course we must not complain when we see their most valuable custom go elsewhere, to add to the business, wealth and importance of other cities. If we do not help ourselves up in the world, who will help us up? The great value of railroads to a city is no longer an open question. See what Boston is gaining by them!

#### The Canada Railroad.

The railroad leading from Niagara river to Detroit, through Canada, is now about to commence in good earnest. Charles B. Stewart has been appointed chief engineer of location and survey; and will have the work prepared to put under contract early in the spring. With reference to the construction of a bridge over the Niagara river, which we now regard as a settled matter, the earnest now given that the Canada road is to be built, may be looked upon as a fortunate event upon both sides of the river. We notify those at a distance, who have distrusted the final consummation of the enterprise,

of the strong probability that by the 1st of July, 1848 they may pass over the Niagara river on a suspension bridge, and on to Detroit, over a well constructed railroad.—*Niagara Dem.*

#### Commerce of the World.

The Washington Union publishes an able article upon the subject of the tonnage and commerce of different nations—from which we take the following letter. One fact is gathered from the statements—which is of interest—to wit, that the mercantile marine of the United States is the *first* in point of tonnage, in the world.

FRANKFORT-ON-THÉ-MAIN, NOV. 30, 1846.

DEAR SIR:—I will now proceed to show the amount of commercial tonnage owned by the states of Europe and the United States of America, at the present time. I have derived the statements from the consuls and other representatives of the different countries, and in most instances, they may be regarded as entirely authentic:

Nation.	Amount of Tonnage.
Great Britain.....	3,000,000
France.....	590,000
Sweden and Norway.....	480,000
Holland.....	375,000
Prussia.....	325,000
Austria.....	210,000
Two Sicilies.....	208,000
Sardinia.....	170,000
Denmark.....	150,000
Greece.....	148,000
Turkey.....	180,000
Portugal.....	81,000
Spain.....	80,000
Bremen.....	60,000
Hamburg.....	57,500
Hanover and Oldenburg.....	57,000
Russia.....	51,000
Ionian Islands.....	49,000
Mecklinburg-Schwerin.....	46,000
Roman States.....	39,000
Tuscany.....	25,000
Belgium.....	28,000
Lucca.....	20,000
United States of America.....	2,400,000

Total..... 8,734,000

Of which the citizens of the United States, as is seen, own well nigh to three-eighths. Although the mercantile marine of Great Britain is apparently a fifth larger than ours, yet in reality, from the manner of measurement in the two countries, this inequality in size does not exist. In a report of a late Secretary of the Treasury to Congress, it was "respectfully recommended that the mode of ascertaining the tonnage of any ship or vessel, as directed by an act to regulate the collection of duties on imports and tonnage, approved 2d March, 1799," be so far altered and amended as to require that the actual depth of the ship or vessel be measured, that the breadth thereof be measured at every perpendicular foot at the broadest part above the main walls, that average of the breadth be made, and then that the length and breadth, as averaged, and depth as measured, be multiplied, with the deduction as directed by that act. This change has become important, because in modern times models of ships and vessels have been so altered as that the mensuration directed by that act does not approximate to the true tonnage, but makes it appear far less than the truth." Now, in support of the justness and correctness of these conclusions, I will state that in the movement of produce from the United States, in 1843, to a port in northern Europe, 107 foreign vessels carried 59,438,797 tons—thus averaging 555 tons; while 23 vessels, sailing under our flag, carried 16,483 tons; being 716 tons for each. This statement was made up under my own eye and direction; and I hazard nothing in stating that, according to the method of measuring ships in different countries, it would be found, upon examination, that in the aggregate, we do this proportion of the carrying by the tonnage which we have employed. It follows, then, that for practical purposes, our shipping is more effective than the shipping of Great Britain, or the shipping of all the remaining states of Europe, and that we have now, what I verily believe, the *first* mercantile navy on earth.

Correspondents will oblige us by sending in their communications by Tuesday morning at latest.

AMERICAN RAILROAD JOURNAL.

Published by D. K. MINOR, 405 Chestnut St., Philadelphia.

Saturday, January 23, 1847.

LOCOMOTIVE AND CAR AXLES.

The Subscribers are now prepared to receive orders for the well known and approved *Reading Locomotive and Car Axles*—drawn to any required pattern from *Bloom Iron Works*. Address

SAM'L KIMBER & CO.,  
Willow Street Wharf,  
Philadelphia, Pa.

41f

NOTICE TO RAILROAD CONTRACTORS.

PROPOSALS will be received at the Office of the Boston and Maine Railroad, No. 60 State street, Boston, until Monday, the 8th day of February next, for the Graduation and Masonry on the line of Road in Andover, between the Merrimack River and a point of intersection with the old Road.

For examination of profile and work, application may be made at the office of the Engineers, at the Depot in South Andover.

THOMAS WEST, President  
Boston and Maine Railroad.

January 22, 1847.

34d

The "Eureka."

We find, monthly, upon our exchange table, this excellently well-conducted quarto—published in N. York, and edited by Messrs. Kingsley and Pierson. The work is devoted to the discoveries of Science and the inventions in the Arts—and is altogether a handsome sheet, very creditably managed. Mechanics and manufacturers will find this work useful—as it is filled with matter concerning their interest, and warmly advocates their cause. We would cheerfully commend the "Eureka" to favorable notice, as a deserving periodical, and well worthy the favor of the public.

Liability of Owners.

We see it stated in the *Pittsburg Journals*, that a gentleman who was a passenger on board the steamboat (with his wife) at the time the late disaster occurred there, by explosion, has recovered \$1500 damages from the owners of the boat. It was shown in evidence that the gentleman was on board, and in consequence of the accident was detained some ten or eleven days, from the scalding and bruises he received. It was also proved that the boilers were old and unsafe, and the Judge charged in favor of the plaintiff. This decision and verdict is important. We learn, also, that Mr. Sylvanus Walker, who was injured by a collision of the cars upon the Western railroad, at Palmer, in August last, has recovered from the road \$1700. Too much care cannot be taken in the management of public conveyances; and these repeated verdicts in favor of the injured parties, must serve a salutary purpose, we should judge.

Plank Roads.

A correspondent of the Rochester American recommends in strong terms, the construction of a Plank road from that city to Lima, N. Y. He is in favor of thick planks and a double track. The opinion of Mr. Geddes, as our readers will recollect, is that on roads of ordinary travel a single track is sufficient. The correspondent considers some of the estimates made by Mr. Alvord, of Salina, recently published in this paper, too low. We suppose that this may be so, adds the editor of the American, as timber is somewhat more costly here than in Mr. Alvord's neighborhood. Nothing is known practically about the construction of plank roads in this section. We look for an exemplification of their expense, and their benefits in the one about to be built between Rochester and Henrietta. When that shall be completed, it is thought the citizens of Rush and Mendon and Lima, will find means to continue it. We trust the owners of property on that important route will see that the stock of the Henrietta road is speedily taken.

Lewiston and Waterville Road.

A correspondent of the Portland Advertiser says that a committee of the corporations of the Androscoggin and Kennebec railroad, chosen at Waterville for that purpose, have secured the services of an experienced, able and efficient man to superintend the laying out and construction of their road. The work is to commence as soon as it is ascertained that enough is subscribed to the books to grade the road through from Danville to Waterville.

It is believed that the subscriptions in the country are going forward with most successful despatch, and that their portion of the duty of raising the preliminary sum for organization is about accomplished. One of the towns in the interior—not the most wealthy or populous—has already given an actual subscription \$5000 higher than the estimate given for it at Waterville. It is hoped that Portland will complete her share forthwith, considering her facilities in having her population concentrated, and her deep interest in the enterprise. It is highly desirable that the company should be organized without the loss of a day.

An agent should be and is expected to be on the ground next week, to renew and perfect the surveys as far as possible before a fall of deep snow. The feeling among the stockholders is to have the work of grading the whole length of the line put under contract early in the spring.

Well Said.

"A seaport town, without a direct and ready intercourse and trade with the interior, is at best but a mere entrepot and fitting-out place for shipping."

So says the Salem Register, in reference to a road built from that city directly into the country to Andover and New Hampshire.

Besides the general and obvious correctness of the above remark, adds an exchange, it has a peculiar and fruitful meaning in reference to the improvement which the railroad brings to a seaport town. What is the slight effect of a railroad upon a commercial port, when it merely passes along the line of coast, from one point of commerce to another, as we see by the manifest examples of Portland and Portsmouth and Salem. A similarly small and comparatively unimportant result would display itself at Bath, and other places, where projected lines of road would only skirt the coast, parallel with present sea routes.

But let any town on the seaboard penetrate the interior directly by a railroad, then comes develop-

ment, growth, enlargement of existing resources and the creation of new facilities and new supplies both for town and country. Boston is the pre-eminent and rich example of this—an example so clear-so impressive, that all her neighboring cities have taken the hint. Salem, Providence, Portsmouth, and many others from Portland to New York, including both, desire and determine to imitate such an example. Nothing can be more legitimate or more promising on their part.

The Railroad Interest.

A resolution has passed the House in the Pennsylvania Legislature, instructing the committee of ways and means to report a bill, providing for offering at sale the canals and railroads owned by the Commonwealth, or such parts thereof as they may deem expedient. This may prove a very good move.—Companies, or individuals, can carry on business to better advantage, as a general principle, than states or governments.

It is stated in the telegraphic despatches of the N. York papers from Albany, that the commissioners to locate the New York and Erie railroad, reported to the New York Legislature, in favor of the route through Pennsylvania.

A meeting was held at Fulton, Oswego county, on Monday last, to take into consideration the propriety of co-operating with the inhabitants of other towns, in reference to the construction of a Plank Road from Oswego to Syracuse.

The Quebec Gazette—one of the oldest and best papers in Canada—says that the Atlantic and St. Lawrence railroad is fast progressing, and will, when completed, be one of the most important and profitable roads in the country—280 miles, and Portland is in connection with the lakes, grasping the whole western trade. It will go ahead, with rapid strides, of Boston, and will be the principal depot of the Atlantic steamers in a year or two. No city in the Union has the same natural advantages. New York is 475 miles from the Lakes—Boston 525.—Portland has a noble harbor; but three miles from the broad Atlantic. No pilots are required to enter or leave her port, and she will undoubtedly become one of the most important commercial cities in the Union. The Bostonians are not willing to believe that this road will be made, it is so dead against the city of Boston, which must keep wide awake or be beaten.

The Boston Traveller, alluding to the opening of the first section of the Northern railroad says, last Saturday was a gala day in a portion of N. Hampshire. It was the day on which the first section of the great Northern railroad was opened; a road which is destined to connect Boston, by way of Concord, N. H., with Burlington, Vt., and the lakes, Ogdensburg, and Western New York; and, as some of its most sanguine friends suggest, Boston with the Pacific ocean, the Sandwich Islands, Canton and Calcutta, by means of Whitney's grand Pacific railroad. And, however visionary this last suggestion may appear to some, it is scarcely less so than what we now witness would have appeared five and twenty years ago to us.

The Yankee Blade states that the contracts for the grading, etc., on the line of the Peterboro' railroad, from the Fitchburg road at Groton, to Townsend, was completed and signed by the parties on Thursday, and the work will be commenced on Monday or Tuesday next. The prospects of the company for the prosecution and completion of the work, are highly favorable, and no doubt can be entertained of a successful result. The gentlemen who have taken

the contract, we are assured, are competent and able to perform it with energy and promptness. The continuation of the route from Townsend to the line of the state at Mason, we presume, will be surveyed and located in the course of the coming Spring, as the New Hampshire company has now been organized, and will proceed in measures to forward the enterprise to Peterboro'.

It is gratifying to see, says the New Haven Palladium, the earnest but quiet manner in which the road to Boston has been projected and begun. We understand that Mr. Farnum, the engineer, contracted last week for five powerful locomotives, to be built immediately at the establishment of Ketchum, Grosvenor & Co., Paterson, N. J.

The Austrian government has just issued an ordinance, declaring that every engine driver on the railroads of the state, who shall have for the space of one year, performed his duties without having caused any accident, shall be entitled to a reward of 100 florins.

The earnings of the Erie railroad for the month of December, 1846, were as follows:

From freight .....	\$10,930 42
From passengers and mail .....	5,053 99
	<b>\$15,974 42</b>
For the same month in 1845 .....	14,130 54
Excess over 1845 .....	<b>\$1,743 78</b>

The Essex, Mass., railroad is fast approaching completion, as far as South Danvers, says the Danvers Courier, but little progress seems to be made on that part of the road from the village of North Danvers. At the entrance of the tunnel in Salem, the workmen are busily engaged in removing the wall by which the connection may be made with the Eastern railroad. Satisfactory arrangements on account of damages having been made with the proprietor of the wharf at North Bridge, the road has been extended over it, and only requires the filling up of the embankment between that place and the Aqueduct point, to enable the locomotive and cars to pass over the road into the Salem depot.

#### Melange of Items.

The largest merchantman ever built in New York city, was launched last week, amid the shouts of the multitude and the discharge of cannon. She was named the Constitution, is a three-decker, and her capacity is said to be from 1500 to 1900 tons.—Her length on deck is 189 feet; breadth 40 feet; and her depth of hold 30 feet. The mainmast is 93 feet, and to the top of the pole is 195½ feet.

A committee of colliery owners and brewers in the counties of Durham and Northumberland, Eng., have commenced a subscription for the purpose of presenting testimonials to Dr. Clanny of Sunderland, as the first inventor of the "safety lamp."

A train of 55 carriages, headed by 5 of the best engines, containing 2500 passengers, made an excursion from Glossop to Sheffield a short time since.

One of the best kinds of composition that can be prepared, says an exchange, to relieve carriage wheels and machinery from friction, is composed of hog's lard, wheat flour and black lead (plumbago.) The lard is to be melted over a gentle fire, and the other ingredients—equal in weight—may be added, till the composition is brought to a consistency of common paste, without raising the heat near the boiling point. One trial of this paste will satisfy any of its superior utility.

The Sun states that the Baltimore and Ohio railroad company have an engine of 25 tons, which

takes a train of empty cars up the Maryland mining company's road to Frostburg, nine miles from Cumberland, (having an ascent of 130 feet per mile, the steepest railroad in the country)—and brings down a train of coal. On the 20th December, there was a fall of snow two feet deep on a level, and much drifted. Their heavy engines, with a newly constructed snow plough that cost only \$40, took the cars up this steep road through drifts of snow eight and nine feet deep; thus showing triumphantly the capacity of railroads for winter service.

The number of passengers between the east and west is said to be about 800,000 annually. Of this number last year 280,000 were carried on the Baltimore and Ohio railroad, and 56,000 by the Philadelphia and Columbia railroad.

A mine of silver ore has been discovered in Dubois county, Ia., and a company are erecting a furnace for the purpose of working it. Forty tons of Missouri pig iron were taken to St. Louis the other day in a keel boat from St. Genevieve, the product of the great iron mountain of that state.

The Manhattan gas company, New York, says the Express, have lately erected on Eighteenth street, between Ninth and Tenth Avenue, a new building, 188 feet long, 92 wide and 48 high. The structure is of brick, and supposed to be the largest of the kind any where. It contains two tanks, each 84½ feet diameter, and each containing 860,000 gallons. The gas holders are placed in these tanks; they are 83 feet in diameter and 40 high, will store 400,000 cubic feet of gas, and weigh about 50 tons. When this company was incorporated it was looked upon as a bubble, but the stock was taken and the works put into operation, and it is now regarded as very important. The demand for gas in that section of New York is very great, and on the increase. The quantities manufactured are:

In 1843—17,950,000 cubic feet of gas.
In 1844—22,750,000 " "
In 1845—29,560,000 " "
In 1846—37,000,000 " "

The Telegraph continues to attract much attention in the west. The Cincinnati Gazette states that a public meeting was held at the Exchange Room on Monday night, to take into consideration the propriety of connecting that city by telegraphic communication with the eastern cities and New Orleans. The Chamber of Commerce resolved it expedient to organize a company to construct such a line; and that suitable trustees ought to be named to take such steps as might be necessary to form such a company and put it in operation. The Chamber expressed a deep interest in the enterprise, and declared its intention to cordially extend its aid and influence in prosecuting it.

The Portland company, for the construction of locomotives and the rolling of railroad iron, have a strong gang at work grading their grounds, and they intend to put up part of their shops this winter. Messrs. Staples & Bartel have also just added a large machine shop to their foundry in Portland, and will now be able to turn out almost any kind and any amount of iron work, such as boilers, engines, machinery, etc., and on as favorable terms as at any other place, remarks the Advertiser. The prospective establishment of the St. Lawrence and Atlantic railroad has given a very great impetus to the business prospects of Portland, and the journals of that city speak in glowing terms of the prosperity of the place.

A correspondence between Col. Robinson, President of the Pittsburg and Connellsville road, and Mr. McLane, President of the Baltimore and Ohio

railway, is published in the Baltimore papers. The Pittsburg company presses an early decision on the question of connecting the Baltimore road with the Ohio and Pittsburg. The Baltimore company object that the decision is pressed at too early a period, and without securing to the Baltimore company the contract necessary to prevent a connection of the Philadelphia road with the Connellsville road, and in that way diverting the travel to Philadelphia, to the injury of the Baltimore company. Mr. McLane is firm, though temperate in his language, and is evidently indisposed to change the course of the Baltimore company, to accommodate the Pittsburgers. He intimates, that a connection of the Baltimore road at a point lower down the Ohio than Pittsburg would be more advantageous to the interests of Baltimore, and expresses the opinion that the difficulties in Virginia, in the way of such connection, are not so great as formerly, and may be overcome.

The common council of Norfolk have held a session, since the recent fire at that place, at which a committee was raised, with instructions to purchase three new engines with suitable apparatus, etc., and with further instructions to devise and report such a reorganization of the fire department as shall insure its future efficiency.

There are contracts enough now issued in the ship yards of Kensington, Philadelphia, to give constant employment to all the shipwrights in that district for the next six months.

The subscription for a cotton factory at Augusta, has been filled, exceeding \$100,000. That is the way to carry on the contest with the north amicably and efficiently.

The Albany Argus says that the increase of tolls on the New York canals for 1846, over that of 1845, will not vary much from \$109,000. On the canals of Ohio, the increase for 1846 over the receipts of 1845, are rising \$128,000.

#### Railroad Convention. Sunbury and Erie Railroad.

A very large Meeting of Delegates to the Convention in this city, pursuant to previous notice, was held at the FRANKLIN HOUSE, on Tuesday last. A preliminary organization took place at 11 o'clock, A. M., at which GEN. WM. F. PACKER, of Lycoming, was elected as *Chairman*, and Messrs J. Camp, of Erie county, and H. B. Mason, of Northumberland county, acted as *Secretaries*. After some suggestions and recommendations in reference to the time and place of holding their meetings, a resolution was adopted, and a committee appointed to call upon the city papers, and propose the publication of the proceedings of the Convention in full. A member of the Convention subsequently informed the meeting that the Chinese Museum could be had for the further sittings of this body, which, upon motion, was adopted, and the meeting adjourned to that place, where they afterwards held their meetings.

Upon the opening of the meeting in the evening, at the Museum, the committee, to whom was referred the subject, reported the following named gentlemen as officers of this Convention:

*President*—HON. J. L. GILLIS, of Ridgway, *Ell county*.

*For Vice Presidents*—John Tucker, of Philadelphia; Hon. Thomas Burnside, of Centre county; Gen. George M. Keim, of Berks county; Dr. Phineas Jenks, of Bucks county; M. R. Moore, of Montgomery county; Major John C. Lessig, of Schuylkill county; Joseph R. Priestly, of Northampton county; Dr. W. H. Magill, of Columbia county; James Moore, of Union county; George White, of Lycoming county; J. P. McElrath, of

Clinton county; Lewis Bensenger, of Elk county; Wm. Keating, of McKean county; Dr. Wm. A. Irvin, of Warren county; and Irwin Camp, of Erie county.

*For Secretaries*—Walter R. Johnson, of Philadelphia; H. B. Masser, of Northumberland county; Benj. H. Cummings, of Schuylkill county; Mr. Sanburn, of Erie county; John S. Richards, of Berks county.

The President, upon taking the chair, made an appropriate speech, in which he stated the objects of this Convention, and concluded by remarking that,

"Great misconceptions and misunderstandings prevail in this city and elsewhere, in regard to the most eligible route for a railroad from the Delaware to the Ohio and Lake Erie. I believe that these errors can be removed by a fair and candid presentation of the facts necessary for the formation of a proper and enlightened judgment on the subject.

"This is our present purpose; we come from various quarters of the Commonwealth, and although we all have our local feelings, yet we think we can prove the policy of the route we advocate by facts cogent and powerful. Gentlemen, I again thank you for the honor conferred upon me, and trust that our proceedings will be marked with harmony."

The following resolution, offered by Judge Palmer, of Pottsville, passed unanimously:

Resolved, That the cordial thanks of this Convention are due, and hereby tendered to Mr. D. K. Minor, Proprietor of the FRANKLIN HOUSE, Chestnut street, for the liberality and kindness extended to the convention, in the use of his House.

After a few speeches, *pro* and *con*., a resolution was offered and passed, to invite the citizens of Philadelphia to attend the sittings of this Convention. The meeting then adjourned to Wednesday morning.

The Convention was addressed by several gentlemen, in an able and interesting manner—and in the course of their remarks, all the advantages of the Sunbury and Erie route were presented, and the speakers offered many able arguments and much valuable information, in reference to the trade of the country through which it may be proposed to carry this road. Mr. Joseph M. Sanderson delivered a long and well written address upon the subject, which contained numerous statistics of a highly interesting nature.

At the Evening Session on Wednesday, immediately after the call to order by the President—Mr. Hegins, the Chairman of the Committee on Resolutions, submitted the following for the consideration of the Convention:

Resolved, That the convention of delegates from 15 counties of Eastern, Northern and Western Pennsylvania, have met for the single purpose of appealing to the sober judgment of their fellow citizens throughout the commonwealth, in behalf of an improvement which has long been neglected and which they believe to be entitled to the most favorable consideration.

Resolved, That they are satisfied that the West Branch of the Susquehanna, is the route by which a railway communication between Eastern and Western Pennsylvania can best be made; and the only one by means of which Lake Erie and the Ohio river can with equal facility be reached.

Resolved, That for the promotion of the general interest, the West Branch route is, in their judgment, preferable, as it involves no conflict with the State improvements, which it is well to remember are not yet paid for, and whose income has been pledged to the public creditors, we, as citizens of a commu-

nity anxious to pay our honest debts, have no right to trifle with.

Resolved, That for the promotion of their own interests, as well as the country through which it passes, as the extreme points, and especially of Philadelphia, the West Branch route is preferable as benefiting a part of the country of peculiar, though undeveloped, resources. And in relation to Philadelphia by terminating at a point accessible by an extension of improvements by railroad and canal, through which, without fear of a successful rival, the trade of the west can be brought to Philadelphia.

Resolved, That we desire especially to call public attention to the importance and value of the trade of the great lakes, and as a means of commending it, to the peculiar control over it which Pennsylvania has in the harbor of Erie, the best, if not the only harbor on the southern shore—a harbor which Pennsylvania was once wise enough to purchase at great cost, which rival states are now seeking to secure, and which only the citizens of Eastern Pennsylvania seem disposed most inconsiderably to undervalue.

Resolved, That we earnestly remonstrate against that plan of improvement, founded, as we believe, on the most mistaken policy, which proposes to make a point within a neighboring state, such as Cleveland, the western termination of the Pennsylvania works, and to pass by neglected and condemned, our own Lake Harbor of Erie, leaving to the citizens of North-western Pennsylvania, the poor consolation of a desperate hope that after millions shall be spent to build up a foreign city, a remnant of generosity may do something for ourselves.

Resolved, That this convention has no wish to place itself in an adverse attitude to the enterprise known generally as the Central railroad; in support of which, much spirit in certain sections of the state has been aroused, but is content to utter a word of respectful, but earnest warning against any design, under any pretext, or by reason of any supposed necessity, to adopt a route which precludes the claims and rights of North-western Pennsylvania, and renders hopeless the just expectations of citizens.

Resolved, That we will gladly unite with the friends of the Pennsylvania railroad in procuring such a modification of their charter, as to enable them to select with entire freedom, the best route between eastern and western waters, with no other limitation or restriction, than fixing its termini in the east at Philadelphia, and in the west on the Ohio at Pittsburgh, and the lake at the harbor of Erie, thus leaving the wide area of the state from its southern to its northern limit, open for free, disinterested and impartial exploration.

Resolved, That this convention, representing a large and intelligent part of the population of the state, renew to their friends in other sections, who merely differ from them in choice of routes, the expression of a desire of friendly consultation and co-operation, offering to them aid in removing obstacles to success, and asking in return a fair hearing,

and the exercise of disinterested judgment and of patriotic impulses, having no other object than the promotion of the general welfare of the state, and the prosperity of its great metropolis.

Resolved, That the resolutions, signed by the officers of the convention, be communicated to both houses of the Legislature and that they be printed.

These resolves caused a spirited debate, which continued to the adjournment of the meeting on Wednesday, without their adoption. On Thursday morning the Convention re-assembled—and the Resolutions were finally passed, after being amended and modified to read as we have given them above.

At the subsequent meeting of the Convention—several speeches were offered, and the whole subject was fairly discussed, until Thursday evening—when the Convention, after passing a vote of thanks to its officers, and a resolution that the City and State be requested to print the proceedings of the Convention, together with the Addresses of Messrs. Packard and Randall—adjourned *sine die*.

We may add that the Delegates evinced a commendable spirit throughout their deliberations, and we doubt not that an important impression upon the public mind, in reference to this subject, will be the result.

#### Niagara Suspension Bridge.

The subscription to the capital stock of the suspension bridge, at Niagara Falls, has been commenced—and it is in contemplation to begin the work early next spring. The charter is now complete—having received the sanction of the legislature of New York, and the same having been signed by the Queen. The bridge, when completed, will without doubt, prove a monument of art and utility.

The editor of the Rochester American has been shown by Mr. Stuart, (one of the commissioners) a plan of the structure, which is described as follows:—

"The plan, designed by Mr. Stuart—is to consist of suspension wire cables and a substantial cast iron arch combined. This plan would, it is thought, secure in an eminent degree the unyielding stability which is especially desirable in a bridge over which railroad trains are to pass. The span of the arch and cables should be only 450 feet."

The editor of the American remarks;—

"We have not time at present to describe this design in detail, but it appears admirably calculated to answer the desired ends. Plans are also in preparation by Charles Ellet, Jr. Esq., of Philadelphia, John A. Roebling, Esq. of Pittsburg, and other engineers of distinction. That one will be eventually adopted which the directors shall deem best. We have never doubted the entire feasibility of this enterprise, and we rejoice to learn that its early accomplishment is probable.

"Although few suspension bridges have as yet been built in this country, their merits have been successfully tested in Europe. We perceive that in various parts of the Union they are beginning to attract attention. In 1842, Mr. Ellet erected a bridge of this description across the Schuylkill at Philadelphia, which has proved entirely satisfactory, and Mr. Roebling has built an aqueduct and a bridge on the same principle at Pittsburg. We learn that it is in contemplation to construct a suspension bridge across the Ohio river at Cincinnati, and have lately seen a description and drawing of this vast proposed work by Mr. Roebling, of which we design to speak more particularly at an early opportunity.

Having recently understood that reports prejudicial to the stability of the suspension bridge over the Schuylkill were to some extent in circulation,

we have taken the trouble to inquire into their truth, and are pleased to learn that they have no foundation. We have seen a private letter under date of the 37th ult. from Mr. Ellet, the engineer who projected and built the bridge, from which we make the following extract:

"My bridge, you may rest assured, has never yielded a particle since the day it was finished, and continues to give entire satisfaction."

"We have equally satisfactory accounts of the suspension structures erected at Pittsburg by Mr. Roebling, and we trust and expect that an additional distinguished exemplification of the utility of suspension bridges will soon be presented at Niagara Falls."

#### Macon and Western (Georgia,) Railroad. First Annual Report.

We have received the first annual report of this company. It shows a very favorable state of things. The company was organized only on the 6th of January, 1846; and the entire road was relaid, and the machinery put upon it, before the 1st of October—or in less than nine months; a result which shows what may be done by business men, with a fair field before them.

The success of the first three months' operations on this road is hardly a fair specimen of what may be looked for hereafter.

This road was purchased on the 6th day of January last, and since that time, timber has been provided to rebuild the entire track, and the work completed, so that the road was opened its whole length from Macon to Atlanta, one hundred and one miles, on the 4th day of September, and a regular freight and passenger business commenced on the 1st of October.

Since the 6th of January last, new and permanent depots and water stations have been erected on the whole line. A machine shop for the repair of engines, and a car factory, provided with the most approved and ample machinery, have been established.—Five new first class engines, four new passenger cars, two second class passenger cars, forty-eight eight-wheeled freight cars, have been provided and placed on the road; in fine, a new road, with the most approved machinery, has been constructed and put into operation since the 6th day of January last, and has been doing a regular freight and passenger business since the 1st day of October.

Below will be found an estimate of the cost of the road, machinery, etc., as made in November, 1845, and also the actual cost as appears on the treasurer's books.

The original estimate was to be credited with all the old iron, etc., which might remain after the construction of the road, which is as follows:

Tons.		
273	plate rail 2½ x 7-16, worth \$10.....	\$10,920
74	old wheels and other castings, a 20.....	1,480
20	broken plate rail, a 30.....	600
10	old axles, a 40.....	409
23	scrap iron, a 35.....	770

It will be seen that the principal under estimate is in timber, iron and spikes, the former arising from the fact, that it was judged advisable to exclude all the old timber from the new track, and 1331 tons of new iron, and 1906 casks of spikes were purchased, instead of 1200 tons of iron and 1000 casks of spikes, as originally estimated.

It is believed the interest of the company has been consulted in these changes, and that

full remuneration for the additional cost will be found in the reduced expenses of keeping the road in repair.

Estimate.	Cost.	Above estimate.	Below estimate.
Original purchase money.....	\$155,100 00		
5 new locomotives.....	40,000 00	36,042 19	3,957 81

The receipts of the road from the 1st Oct. to the 31st Dec., inclusive, are as follows:

	Freight.	Passengers.	Mails.	Total.
October.....	7,411 87..	3,375 73..	494 70..	11,112 29
November 6, 128 30..	2,786 66..	411 00..		9,325 96
December 7,461 75..	4,306 59..	434 70..		12,102 04
	20,956 03..	10,312 96..	1,360 40..	32,540 29

Gross expenses for three months ending 31st December.....\$14,060 51  
Deduct inventory materials on hand.....3,299 45

Net expenses for three months ending 31st December.....10,761 06

Net earnings for three months ending 31st December.....\$21,779 23

N.B. As portions of the road have been run over by timber and other trains since 4th of July, the earnings and expenses to the 1st of October have been carried to debt and credit of timber.

In concluding this report, the directors take great pleasure in stating to the stockholders, that the road has been constructed in a most substantial manner; that the engines, cars, machinery, etc., are of the newest and best construction; that the connection with the Central, Georgia and State roads, forming a line of 595 miles of railroad within the State of Georgia, insures a steadily increasing business. That the road from Macon to Barnesville, 40 miles, forms a part of the mail route from Savannah to Columbus. The portion from Griffin to Atlanta, 43 miles, forms a part of the great mail route from Charleston to New Orleans; that the road bed running along the ridge that divides the waters of the Gulf of Mexico and the Atlantic, is without a bridge on its whole length, 101 miles. As fuel and labor are cheap, the expenses of this road will be less than any other of the same length in the U. States; and the directors, in concluding, have much satisfaction in remarking, that judging

from the result of the three months, and the very encouraging prospect of an increasing business, that the net revenue will fully equal representations made, and give entire satisfaction to shareholders.

By order of the board of directors,  
DANIEL TYLER, President.  
Macon, January 1st, 1847.

MACON AND WESTERN RAILROAD,  
Macon, January 1st, 1847.

Herewith I submit a condensed statement of the actual cash receipts and expenditures by this company, from its organization on the 6th day of January last, to this date.

This statement exhibits also the sources, under distinct heads, from which the monies have been received, and the general purposes for which they have been expended.

By the original plan of organization, adopted before the formation of the company, the first instalment on capital stock, amounting to \$27 10 per share, was paid to the committee appointed by the corporators to perfect the organization of the company under the new charter granted by the Legislature of Georgia, at their last session.

By the report of this committee made in January last, it appears they have received on account of capital stock, the sum of \$260,923 00, and that out of this sum they had paid on account of the purchase money of the road, its fixtures and equipments,

The sum of.....\$145,566 38  
And had transferred the balance to the treasurer.....115,356 62

Assuming, however, for the purpose of presenting the receipts and expenditures in one view, that the whole sum paid in on capital stock, was received by the treasurer, and expended by him, the cash account will stand as follows:

TREASURER'S ACCOUNT.		December 31st, 1846.
Dr.	Capital Stock.	
Cash received on 9130 shares a \$46 27		\$422,445 10
" " 1500 " a 29 17		43,755 00

J. G. FORBES Treasurer.

MACON, January 1st, 1847

We the undersigned forming the standing committee on accounts, do hereby certify, that we have made monthly examinations of the vouchers of the treasurer, from the 6th day of January last, to this date, and compared the same with the cash book entries, and find the said vouchers to correspond with said entries. (Signed)

N. C. Munroe, Charles Day, Washington Poe, C. J. McDonald—Committee.

#### STATE OF THE COMPANY.

January 1st, 1847.

<b>Cash Resources.</b>	
Bills receivable and interest.....	\$59,410 68
Reserved shares.....	51,994 34
Cash on hand.....	38,225 96
Old iron, etc.....	14,170
Sundry debts.....	585 12
Freight earnings.....	4,623 60
Passenger earnings.....	376 01
Mail.....	1,250
Claims on the Monroe Railroad and Banking Company.....	12,000
	<b>\$182,625 71</b>
<b>Liabilities.</b>	
Bills payable.....	51,771 35
Sundry debts.....	12,018 61
	<b>63,790 56</b>
Balance cash resources....	<b>\$118,835 15</b>

The resources in the above statement, are believed to be all good and available, at the amounts therein set down.

The only item about which any doubt exists, is the estimate upon the claims against the late Monroe Railroad and Banking Company.

These claims were assigned to this company by Robert Collins and John D. Gray & Co., in January last, and amounted at the date of the transfer, to the sum of \$100,000.

A fund has been created by the sale of the old road and the other property and assets, belonging to that corporation for the payment of its debts, and which fund it is understood, now amounts to a sum exceeding \$140,000.

This company is entitled to a proportionate part of the fund, by virtue of the above specified claims. But it is impossible to state what amount of dividend will be received, as the sum may be materially increased or reduced by the rejection or admission of the numerous other claims presented.

It may, however, from present appearances, be fairly presumed that the amount to be realized from this source, will not fall short of \$12,000 and will probably reach \$15,000.

J. G. FORBES, Treasurer.

At a meeting of the Directors of the Macon and Western Railroad Company, held at the company's office in Macon, on the 5th day of January, 1847—present

DANIEL TYLER, President.

Directors.—C. J. McDonald, N. C. Munroe, J. G. Forbes, Washington Poe, Charles Day.

The annual reports of the Directors and Treasurer having been read and approved, and directed to be published, it was

Resolved, That a return be made to the stockholders on the 1st day of February next, of \$5 07 on each and every share, out of the surplus remaining after the completion of the road, fixtures and equipments; and also a di-

vidend of \$1 33 per share, out of the net earnings of the road, for three months ending on the 31st December, 1846, and that the Treasurer publish the necessary notices.

J. G. FORBES, Secretary.

The following is a list of the DIRECTORS of the company:

Daniel Tyler, President, Norwich, Conn.; J. G. Forbes, Treasurer, Syracuse, N. Y.; Nathan C. Munroe, Charles Day, Washington Poe, Macon; Charles J. McDonald, Marietta, Geo.; Andrew Low, Jr., Savannah, Geo.; Ker Boyce, Charleston, S. C.; Edward Whitehouse, Theodore Dehon, Adolf Rodewald, New York; Azariah Booddy, Springfield, Mass.; Rufus H. King, Albany, N. Y.

#### The Central Railroad.

The North American says that the subscriptions to the stock of the Central railroad are steadily, if not rapidly progressing, and we learn from the commissioners that a much better feeling exists in relation to the subject than at any time previously. Quite a number of the banks and insurance companies have come forward during the past week, and subscribed liberally, but by far the greater portion of the stock is held by individuals.—The whole number of shares now subscribed amount to 24,400, and it is necessary, before the city, by virtue of the late ordinance, subscribes to the amount of \$1,500,000, that 5,600 shares further should be taken, which we have little doubt will be the case in the course of a fortnight at the farthest, thus securing the \$3,000,000 required to be subscribed before the organization of the company. Our citizens will thus see the importance of one more vigorous movement—one effort, which to their united energies is, as nothing, and this accomplished, by far the greatest obstacles in the way of this important project will have been overcome.

It is impossible to conceive how great an impulse would be given to the trade of our city had we a continuous railway communication with the lakes. We have been almost astounded when looking at the enormous quantities of produce from the west, seeking an outlet through the New York canals; yet were the Pennsylvania road extended to Pittsburg, and a railroad constructed between that city and Cleveland, (as there will be by the time our road is finished) this immense amount of produce would take a different route, and instead of passing through the N. York canals would come hither. With what success we could compete with all other lines for the lake trade, the annexed table will show, prepared as it is from accurate data, and showing the cost per barrel for transporting flour from the west to the sea board:

From Cleveland to Philadelphia,	54c. per bbl.
From Cleveland to Baltimore,	64c. "
From Cleveland to New York,	79c. "
From Cincinnati to Philadelphia,	79c. "
From Cincinnati to Baltimore,	87c. "
From Cincinnati to New York,	107c. "
From Cincinnati to New York, by river and sea via New Orleans,	114c. "
From Cleveland to N. York, by lake and canal,	90c. "

Against the progress of a line of communication possessing such advantages, no ob-

stacles, no matter how great, can long prevail.

#### Great Pacific Railroad.

The following particulars in relation to this scheme, we copy from a late number of the Philadelphia Ledger.

In 1803, Mr. Jefferson, then President, sent Captains Lewis and Clarke, with a party of soldiers, to explore the country from the Mississippi river, along the Missouri, to the Pacific ocean. Even then Mr. Jefferson, with that foresight which enabled him to look far over the heads of his cotemporaries, to the immense importance of Louisiana to the Union, perceived, across this continent, up the Missouri and down the Columbia, the shortest avenue to the trade of China and India, that source of wealth which had successively raised empires, and for which the Caucasian race had been contending for more than three, perhaps for ten thousand years. Railroads were then unknown. And had they never been invented, the avenue foreseen by Mr. Jefferson, and for whose exploration he sent the expedition commanded by Lewis and Clarke, would have been destined hereafter to this trade. But if the navigation of these rivers is to be superseded by railroads, and a more direct and permanently open route is thus to be obtained, the superiority of Mr. Jefferson over his opposing cotemporaries in statesmanlike foresight, is not the less conspicuous; and the exploration of Lewis and Clarke have been the basis of all subsequent examinations of the country between the Mississippi and the Pacific.

The route proposed by Mr. Whitney for his railroad, proceeds from Lake Michigan, across the Mississippi above the mouth of the Wisconsin, thence across the Missouri above the mouth of the Great Platte, between the Council Bluffs and the Great Bend, a little below lat. 43, and thence to the Great South Pass, about lat. 42 30, and thence along the valley of Lewis' river, which is the southern main branch of the Columbia, to the head of ship navigation upon the latter, or to the bay of St. Francisco, as may hereafter be decided. Taking the Great South Pass as a point of departure eastward and westward, our first object is to ascertain the respective distances and elevations. According to Col. Fremont, quoted in the report of Senator Breese, the elevation of the highest point in this Pass, above the Gulf of Mexico, is 7490 feet. Col. Fremont, who explored the valley of the Great Platte, from its mouth to this Pass, in 1842, describes it as an open Prairie region, with an ascent almost or quite imperceptible by the traveller. He was accompanied by a Mr. Carson, who had resided in that region for 17 years, who had frequently crossed the Pass, and was thoroughly acquainted with the route. Yet, with all his experience, he was obliged to watch very closely, to ascertain when he had reached the culminating point of the Pass through the Rocky mountains. The distance of the Great Pass to the mouth of the Kansas, is 962 miles, and from the mouth of the Platte, 882, the latter being about 300 miles higher on the Missouri than

the former; and as the mouth of the Kansas is 700 feet above the Gulf of Mexico, and that of the Platte a trifle more, the average ascent from either point to the Pass, is only about 7 feet to the mile. And as the distance from Lake Michigan to the Pass is 1400 miles, and that between the lake and the mouth of the Kansas or Platte a level country, the average ascent from the lake to the Pass does not exceed  $4\frac{1}{2}$  feet to the mile. According to Col. Fremont, the mouth of the Kansas is 700 feet above the Gulf; the crossing of the Republican Fork, 516 miles farther, is 2300 feet, giving an ascent of  $4\frac{1}{2}$  feet to the mile; the ascent of the next 128 miles is 1000 feet, or about 8 to the mile; that of the next 107 miles, to St. Vrain's Fort, is 1000 feet, or 9 to the mile; that of the next 80 is 1300 feet, or 16 to the mile; that of the next 18 miles is 800 feet, or about 42 to the mile; that of the next 87 miles is 200 feet, or  $2\frac{1}{4}$  to the mile.

The distance from the Great Pass to the mouth of the Columbia, by the common travelling route is 1400 miles, and to the head of its ship navigation about 1230; and as the elevation of the Pass is 7490 feet, the descent from this point to ship navigation gives an average of about 6 feet to the mile. From the Pass to a distance of 311 miles, the descent is 1490 feet, or less than 5 to a mile.—For 234 miles more, the route is level. For 540 miles more, the surface is irregular, and the next 178 miles end at an elevation of 3000 feet; the descent from 6000 to 3000 feet, over a distance of 718 miles, giving an average of less than 3 feet, though that of the last 178 miles is 17 feet to the mile. From this point to the foot of the Blue mountains, 282 miles, the elevations and depressions give an average of  $10\frac{1}{4}$  feet to the mile; and the remaining distance to Fort Vancouver, the head of ship navigation, 303 miles, gives an average of  $3\frac{1}{4}$  feet. All these elevations were taken by Col. Fremont, over the route usually

travelled, though the committee suggests that future explorations will discover routes of less distances and ascents.

These facts show that in a distance of 2630 miles, from Lake Michigan to Fort Vancouver, the elevation of the Great South Pass, 7490 feet, and of the intermediate points, present no obstacles to a railroad.

#### NOTICE TO RAILROAD CONTRACTORS.

Proposals will be received by the Subscriber, at the office of the Michigan Central Railroad Company, at Detroit, until the 16th day of February next, for Grading the first thirteen miles of the Extension of the Michigan Central Railroad, from Kalamazoo, westward; said thirteen miles contains about four hundred thousand cubic yards of earth work. Plans and Specifications will be ready for examination at the office of the subscriber after February 1st.

J. W. BROOKS, Supt. & Eng.

Detroit, January 5, 1847.

**BACK VOLUMES OF THE RAILROAD JOURNAL** for sale at the office, No. 105 Chestnut street.

**A. & G. RALSTON & CO., NO. 4** South Front St., Philadelphia, Pa.

Have now on hand, for sale, Railroad Iron, viz: 180 tons  $2\frac{1}{2}$  x  $1\frac{1}{2}$  inch Flat Punched Rails, 20 ft. long. 25 "  $2\frac{1}{2}$  x  $1\frac{1}{2}$  " Flange Iron Rails. 75 "  $1\frac{1}{2}$  x  $1\frac{1}{2}$  " Flat Punched Bars for Drafts in Mines. A full assortment of Railroad Spikes, Boat and Ship Spikes. They are prepared to execute orders for every description of Railroad Iron and Fixtures.

**RAILWAY IRON.—THE BEST QUALITY** of English Heavy H Rails—60 lbs. to the yard—now in store, landing from the vessel, and on ship board to arrive, for sale on most favorable terms by

DAVIS, BROOKS & CO.,

Jan. 2. [117] 68 Broad St., New York.

**RAILROAD IRON.—THE NEW JERSEY** Iron Company, Boonton, N. J., are now preparing to make Railroad Bars, and are ready to take orders or make contracts for Rails, deliverable after the first of December next. Apply to

FULLER & BROWN, Agent,

No. 139 Greenwich, corner of Cedar street.

September 18, 1846.

**NICOLL'S PATENT SAFETY SWITCH** for Railroad Turnouts. This invention, for some time in successful operation on one of the principal railroads in the country, effectually prevents engines and their trains from running off the track at a switch, left wrong by accident or design.

It acts independently of the main track rails, being laid down, or removed, without cutting or displacing them.

It is never touched by passing trains, except when in use, preventing their running off the track. It is simple in its construction and operation, requiring only two Castings and two Rails; the latter, even if much worn or used, not objectionable.

Working Models of the Safety Switch may be seen at Messrs. Davenport and Bridges, Cambridgeport, Mass., and at the office of the Railroad Journal, New York.

Plans, Specifications, and all information obtained on application to the Subscriber, Inventor, and Patentee

G. A. NICOLLS,  
Reading, Pa.

**RAILROAD IRON.—THE SUBSCRIBER'S** New Rail Iron Mill at Phoenixville, Pa., is expected to be ready to go into operation by the 1st of September, and will be capable of turning out 30 to 40 tons or finished Rails per day. They are now prepared to receive orders to that extent, deliverable after the 1st of October next, for heavy rails of any pattern now in use, equal in quality and finish to best imported.

**PIG IRON**—They are also receiving weekly 150 to 200 tons of No. 1 Phoenix Foundry Iron, well adapted for light castings.

Have now a supply, and respectfully solicit the patronage of persons engaged in the making of Machinery, for which purpose the above makes of Pig Iron are particularly adapted.

They are also sole Agents for Watson's celebrated Fire Bricks and prepared Kaolin or Fire Clay orders for which are promptly supplied.

SAM'L KIMBER, & CO.,

59 North Wharves,

Jan. 14, 1846. [174] Philadelphia, Pa.

**RAY'S EQUALIZING RAILWAY TRUCK.—THE SUBSCRIBER** having recently formed a business connection in the City of New

York, expressly for the manufacture of the newly patented and highly approved Railroad Truck of Mr. Fowler M. Ray, is ready to receive orders for building the same, from Railroad Companies and Car Builders in the United States, and elsewhere.

The above Truck has now been in use from one to two years on several roads a sufficient length of time to test its durability, and other good qualities, and to satisfy those who have used it, as may be seen by reference to the certificates which follow this notice.

There have been several improvements lately introduced upon the Truck, such as additional springs in the bolster of passenger cars, making them delightful riding cars—adapting it to tenders, trucks forward of the locomotive, and freight cars, which, with its original good qualities, make it in all respects the most desirable truck now offered to the public.

Orders for the above, will, for the present, be executed at the New York Screw Mill, corner 33d street and 3d avenue, (late P. Cooper's rolling mills) and at the Steam Engine Shop of T. F. Secor & Co., foot of 9th street, East

river, (of which firm the subscriber was late a partner) under the immediate supervision of Mr. Ray himself.

Several sets of trucks containing the latest improvements have recently been turned out for the New York and Erie railroad, and the New Jersey Transportation company, which may be seen upon said roads.

The patronage of Railroad Companies and Car Builders is respectfully solicited.

New York, May 4, 1846.

W. H. CALKINS, and Others.

To all whom it may concern:—This is to certify that the New Haven, Hartford and Springfield railroad co., have had in use six sets of F. M. Ray's patent trucks for the last 20 months, during which time it appears to me, they have proved to be the best and most economical truck now in use.

[Signed,]

WILLIAM ROE, Supt of Power.

I certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Philadelphia and Reading railroad for some time past, under a passenger car.

For simplicity of construction, economy in cost, lightness of material, and extreme ease of motion, I consider it the best truck we have ever used. Its peculiar make also renders it less liable to be thrown off the track, when passing over any obstruction. We intend using it extensively under the passenger and freight cars of the above road.

Reading, Pa., October 6, 1845.

[Signed,] G. A. NICOLL,

Supt. Transportation, etc., Philadelphia and Reading Railroad.

To all whom it may concern:—This is to certify that the N. Jersey Railroad and Transportation company have used Fowler M. Ray's Truck for the last seven months, during which time it has operated to our entire satisfaction. I have no hesitation in saying that it is the simplest and most economical truck now in use.

[Signed,] T. L. SMITH,

Jersey City, November 4, 1845.

N. Jersey Railroad and Transp. Co.

This is to certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Long Island railroad for the last year, under a freight car. For simplicity of construction, economy in cost, lightness of material and ease of motion, I consider it equal to any truck we have in use.

Long Island Railroad Depot,

[Signed,] JOHN LEACH,

Jamaica November 12, 1845.

1719

Supt Motive Power.

**RICH & CO'S IMPROVED PATENT SALAMANDER SAFES.**

Warranted free from dampness, as well as fire and thief proof.

Particular attention is invited to the following certificates, which speak for themselves:

**TEST No. 10.**

*Certificate from Mr. Silas C. Field, of Vicksburg, Mississippi.*

On the morning of the 14th ult., the store owned and occupied by me in this city, was, with its contents, entirely consumed by fire. My stock of goods consisted of oil, rosin, lard, pork, sugar, molasses, liquors, and other articles of a combustible nature, in the midst of which was one of Rich's Improved Patent Salamander Safes, which I purchased last October of Mr. Isaac Bridge, New Orleans, and which contained my books and papers. This safe was red hot, and did not cool sufficiently to be opened until 16 hours after it was taken from the ruins. At the expiration of that time it was unlocked, when its contents proved to be entirely uninjured, and not even discolored. I deem this test sufficient to show that the high reputation enjoyed by Rich's Safes is well merited.

S. C. FIELD.

**TEST No. 11.—Certificate.**

By the fire which occurred in this village on the 27th July last, our Law Office, together with many other buildings, was destroyed—we had in our office one of Rich's Improved Patent Salamander Safes, which, though heated red hot, preserved, without being the least damaged, many papers valuable to our clients—the envelopes of a few papers being slightly scorched. Some twenty-four hours after the fire, the Safe was removed, and so hot was it, that several hours were required for it to cool off. Our office was in the second story of a large brick building, all the wood used in construction of said house being pitch pine. While the Safe was red hot, one of the walls tumbled in, and so injured the lock that it was necessary to break the door open. From this test, we feel no hesitancy in recommending "Rich's Patent Salamander Safe" as *entirely fire proof*.

GOREE & KING.

Marion, Ala., Sept. 15th, 1846.

*Still other Tests in the Great Fire of July 19, 1845.*

The undersigned purchased of A. S. Martin, No. 138½ Water street, one of Rich's Improved Patent Salamander Safes, which was in our store, No. 54 Exchange place. The store was entirely consumed in the great conflagration on the morning of the 19th inst. The safe was taken from the ruins 52 hours after, and on opening it, the books and papers were found entirely uninjured by fire, and only slightly wet—the leather on some of the books was parched by the extreme heat.

RICHARDS & CROOKHITE.

Benton, Miss., December 27, 1845.

One of Rich's Improved Salamander Safes, which I purchased on the 2d of June last of A. S. Marvin, 138½ Water street, agent for the manufacturer, was exposed to the most intense heat during the late dreadful conflagration. The store which I occupied, No. 46 Broad street, was entirely consumed; the safe fell from the 2d story, about 15 feet, into the cellar, and remained there 14 hours, and when found, I am told, and from its appearance afterwards, should judge that it had been heated to a red heat. On opening it, the books and papers were found not to have been touched by fire. I deem this ordeal sufficient to confirm fully the reputation that Rich's safe has already obtained for preserving its contents against all hazards.

(Signed,)

WM. BLOODGOOD.

New York, 31st July, 1845.

Reference made to upwards of nine hundred and fifty merchants, cashiers, brokers, and officers of courts and counties, who have Rich's Safe's in use.

The above safes are finished in the neatest manner, and can be made to order at short notice, of any size and pattern, and fitted to contain plate, jewelry, etc. Prices from \$50 to \$500 each. For sale by

A. S. MARVIN, General Agent,

138½ Water st., N. Y.

Also by Isaac Bridge 76 Magazine street, New Orleans.

Also by Lewis M Hatch, 120 Meeting street Charleston, S. C.

16 U

**FRENCH AND BAIRD'S PATENT SPARK ARRESTER.**

TO THOSE INTERESTED IN Railroads, Railroad Directors and Managers are respectfully invited to examine an improved SPARK ARRESTER, recently patented by the undersigned.

Our improved Spark Arresters have been extensively used during the last year on both passenger and freight engines, and have been brought to such a state of perfection that no annoyance from sparks or dust from the chimney of engines on which they are used is experienced.

These Arresters are constructed on an entirely different principle from any heretofore offered to the public. The form is such that a rotary motion is imparted to the heated air, smoke and sparks passing through the chimney, and by the centrifugal force thus acquired by the sparks and dust they are separated from the smoke and steam, and thrown into an outer chamber of the chimney through openings near its top, from whence they fall by their own gravity to the bottom of this chamber; the smoke and steam passing off at the top of the chimney, through a capacious and unobstructed passage, thus arresting the sparks without impairing the power of the engine by diminishing the draught or activity of the fire in the furnace.

These chimneys and arresters are simple, durable and neat in appearance. They are now in use on the following roads, to the managers and other officers of which we are at liberty to refer those who may desire to purchase or obtain further information in regard to their merits:

R. L. Stevens, President Camden and Amboy Railroad Company; Richard Peters, Superintendent Georgia Railroad, Augusta, Ga.; G. A. Nicolls, Superintendent Philadelphia, Reading and Pottsville Railroad, Reading, Pa.; W. E. Morris, President Philadelphia, Germantown and Norristown Railroad Company, Philadelphia; E. B. Dudley, President W. and R. Railroad Company, Wilmington, N. C.; Col. James Gadsden, President S. C. and C. Railroad Company, Charleston, S. C.; W. C. Walker, Agent Vicksburg and Jackson Railroad, Vicksburg, Miss.; R. S. Van Rensselaer, Engineer and Supt Hartford and New Haven Railroad; W. R. McKee, Supt Lexington and Ohio Railroad, Lexington, Ky.; T. L. Smith, Supt New Jersey Railroad Trans. Co.; J. Elliott, Supt Motive Power Philadelphia and Wilmington Railroad, Wilmington, Del.; J. O. Sterns, Supt Elizabethtown and Somerville Railroad; R. R. Cuyler, President Central Railroad Company, Savannah, Ga.; J. D. Gray, Supt Macon Railroad, Macon, Ga.; J. H. Cleveland, Supt Southern Railroad, Monroe, Mich.; M. F. Chittenden, Supt M. P. Central Railroad, Detroit, Mich.; G. B. Fisk, President Long Island Railroad, Brooklyn.

Orders for these Chimneys and Arresters, addressed to the subscribers, care Messrs. Baldwin & Whitney, of this city or to Hinckley & Drury, Boston, will be promptly executed. FRENCH & BAIRD.

N. B.—The subscribers will dispose of single rights, or rights for one or more States, on reasonable terms.

Philadelphia, Pa., April 6, 1844.

.. The letters in the figures refer to the article given in the Journal of June, 1844.

ja45

**PATENT HAMMERED RAILROAD, SHIP AND BOAT SPIKES.**

The Albany Iron and Nail Works have always on hand, of their own manufacture, a large assortment of Railroad, Ship and Boat Spikes, from 2 to 12 inches in length, and of any form of head. From the excellence of the material always used in their manufacture, and their very general use for railroads and other purposes in this country, the manufacturers have no hesitation in warranting them fully equal to the best spikes in market, both as to quality and appearance. All orders addressed to the subscriber at the works, will be promptly executed.

JOHN F. WINSLOW, Agent.

Albany Iron and Nail Works, Troy, N. Y. The above spikes may be had at factory prices, of Erastus Corning & Co., Albany; Hart & Merriitt, New York; J. H. Whitney, do.; E. J. Etting, Philadelphia; Wm. E. Coffin & Co., Boston.

ja45

**MACHINE WORKS OF ROGERS,**

Ketchum & Grosvenor, Patterson, N. J. The undersigned receive orders for the following articles, manufactured by them of the most superior description in every particular. Their works being extensive and the number of hands employed being large, they are enabled to execute both large and small orders with promptness and despatch.

Railroad Work.

Locomotive steam engines and tenders; Driving and other locomotive wheels, axles, springs & flange tires; car wheels of cast iron, from a variety of patterns, and chills; car wheels of cast iron with wrought tires; axles of best American refined iron; springs; boxes and bolts for cars.

Cotton, Wool and Flax Machinery of all descriptions and of the most improved patterns, style and workmanship.

Mill gearing and Millwright work generally; hydraulic and other presses; press screws; callenders; lathes and tools of all kinds; iron and brass castings of all descriptions.

ROGERS, KETCHUM & GROSVENOR, 445 Paterson, N. J., or 60 Wall street, N. York.

**PATENT RAILROAD, SHIP AND BOAT SPIKES.**

The Troy Iron and Nail Factory keeps constantly for sale a very extensive assortment of Wrought Spikes and Nails, from 3 to 10 inches, manufactured by the subscriber's Patent Machinery, which after five years' successful operation, and now almost universal use in the United States (as well as England, where the subscriber obtained a patent) are found superior to any ever offered in market.

Railroad companies may be supplied with Spikes having countersink heads suitable to holes in iron rails, to any amount and on short notice. Almost all the railroads now in progress in the United States are fastened with Spikes made at the above named factory—for which purpose they are found invaluable, as their adhesion is more than double any common spikes made by the hammer.

All orders directed to the Agent, Troy, N. York will be punctually attended to.

HENRY BURDEN, Agent.

Spikes are kept for sale, at Factory Prices, by I. & J. Townsend, Albany, and the principal iron merchants in Albany and Troy; J. I. Brower, 223 Water St., New York; A. M. Jones, Philadelphia; T. Janviers, Baltimore; Degrand & Smith, Boston.

.. Railroad Companies would do well to forward their orders as early as practicable, as the subscriber is desirous of extending the manufacturing so as to keep pace with the daily increasing demand.

ja45

**DAVENPORT & BRIDGES CONTINUE**

to Manufacture to Order, at their Works, in Cambridgeport, Mass., Passenger and Freight Cars of every description, and of the most improved pattern. They also furnish Snow Ploughs and Chilled Wheels of any pattern and size. Forged Axles, Springs, Boxes and Bolts for Cars at the lowest prices. All orders punctually executed and forwarded to any part of the country.

Our Works are within fifteen minutes ride from State street, Boston—coaches pass every fifteen minutes.

## THE HERRON RAILWAY TRACK,

As seen stripped of the top ballasting

A GOLD MEDAL AWARDED THE INVENTOR BY THE AMERICAN INSTITUTE.

**THE UNDERSIGNED RESPECTFULLY** invites the attention of Engineers, and Railroad Companies, to some highly important improvements he has recently made in the Herron system of Railway structure. These improvements enable him to effect a very large reduction in the quantity of Timber, and cost of construction, without impairing the strength of the Track, or its powers of resisting frost, while they secure additional features of excellence in the Drainage and facility of making Repairs.

The above cut represents the "Herron Track" as it is laid on the Philadelphia and Reading, and on the Baltimore and Susquehanna Railroads. The intersection of the sills of the trellis are 5 feet from centre to centre, while in the new construction they are only 2½ feet. This renders the string piece unnecessary, thus removing the only objectionable feature found in the Track.

The result of experience has proved that all Tracks constructed with longitudinal timbers, such as mud sills, and more especially, the continuous bearing string pieces retain the rain water that falls between the Rails, which, being thus confined, settles along those timbers, and accumulating in quantity flows rapidly along them on the descending grades, washing out the earth from under the timber, and frequently causing large breaches in the embankments of the road. Whereas all water intercepted by the oblique sills of the trellis, is discharged immediately into the side ditches.

In the 5 foot plan, the Track occupies a Road bed nearly 11 feet wide, while the new construction takes

but 8 feet; the timber being more concentrated under the Rails. A block of hard wood, about 2 feet long and 15 inches wide, is introduced into a square of the trellis for the purpose of giving an additional, and effectual support to the joints of the Rails, which rest upon it. Should these joint blocks become chafed and worn by the working, and imbedding of the chairs, as is now the case on all Railroads, they can be readily replaced without any derangement of the timbers less liable to wear.

The following is a general estimate of its cost near the seaboard. In the interior it will be considerably less.

ESTIMATE OF THE PROBABLE COST OF ONE MILE.	
4,224 Timbers, 11 ft. long, 3 x 6 inches =	68,696 ft. b.m., at \$10 = \$686 96
587 Oak joint blocks 2 ft. x 3 x 15 in. =	4,403 ft. b.m., at \$13 = 57 24
13,000 Spikes = 2,250 lbs. at 4½ cts. =	101 25
Workmanship free of patent charge =	600 00

Cost of one mile including the laying of the Rail.....\$1,445 45

He has made other important improvements, which will be shown in properly proportioned models, that give a much better idea of the great strength of the Track than a drawing will do.

Sales of the Patent right to all the distant States will be made on liberal terms.

JAMES HERRON.

Civil Engineer and Patentee.

No. 277 South Truth St., Philadelphia. 33rd

# ENGLISH PATENT WIRE ROPES—FOR THE USE OF MINES, RAILWAYS, ETC.—

for sale or imported to order by the subscriber.

These Ropes are manufactured on an entirely different principle from any other, and are now almost exclusively used in the collieries and on the railways in Great Britain, where they are considered to be greatly superior to hempen ones, or iron chains, as regards safety, durability and economy. The plan upon which they are made effectually secures them from corrosion in the interior, as well as the exterior of the rope, and gives a greater compactness and elasticity than is found in any other manufacture.

Many of these ropes have been in constant operation in the different mines in England, and on the Blackwall and other inclined planes, for three and four years, and are still in good condition.

They have been applied to almost every purpose for which hempen ropes have been used—mines, heavy cranes, standing rigging, window cords, lightning conductors, signal halyards, tiller ropes, etc. Reference is made to the annexed statement for the relative strength and size. Testimonials from the most eminent engineers in England can be shown as to their efficiency, and any additional information required respecting the different descriptions and application will be given by

ALFRED L. KEMP,

75 Broad street, New York, sole agent in the United States.

Statement of Trial made at the Woolwich Royal Dock Yard, of the Patent Wire Ropes, as compared with Hempen Ropes and Iron Chains of the same strength.—October, 1841.

WIRE ROPES.			HEMPEN ROPES.			CHAINS.		STRENGTH
Wire gauge number.	Circumference of rope.	Weight per fathom.	Circumference of rope.	Weight per fathom.	Weight per fathom.	Diameter of iron.	Tons.	
	INCH.	LBS. OZ.	INCH.	LBS. OZ.	LBS.	INCH.		
11	4½	13 5	10	24 -	50	15-16	20	
13	3½	8 3	8½	16 -	27	11-16	13½	
14	3½	6 11	7½	12 8	17	9-16	10½	
15	2½	5 2	6½	9 4	13½	1-2	7½	
16	2½	4 3	6	8 8	10½	7-16	7	

N.B. The working load, with a perpendicular lift, may be taken at 6 cwt. for every lb. weight per fathom, so that a rope weighing 5 lbs. per fathom would safely lift 3360 lbs.; and so on in proportion. 1y24

## AMERICAN RAILROAD JOURNAL.

OFFICE AT THE FRANKLIN HOUSE,  
105 Chestnut Street,  
PHILADELPHIA, PA.

This is the only periodical having a general circulation throughout the Union, in which all matters connected with public works can be brought to the notice of all persons in any way interested in these undertakings. Hence it offers peculiar advantages for advertising times of departure, rates of fare and freight, improvements in machinery, materials, as iron, timber, stone, cement, etc. It is also the best medium for advertising contracts, and placing the merits of new undertakings fairly before the public.

**BOSTON AND PROVIDENCE RAILROAD.** Passenger Notice. Summer Arrangement. On and after Monday, Sept. 28, 1846, the Passenger Trains will run as follows:

For New York—Night Line, via Stonington. Leaves Boston every day, but Sunday, at 5 p.m. Accommodation Trains, leave Boston at 7½ a.m. and 3½ p.m., and Providence at 8 a.m. and 3½ p.m. Dedham trains, leave Boston at 9 a.m.; 3 p.m., 5½ p.m., and 10½ p.m. Leave Dedham at 8 a.m. and 4½ and 9 p.m. Stoughton trains, leave Boston at 11½ a.m. and 4-10 p.m. Leave Stoughton at 8 a.m. and 9½ p.m. All baggage at the risk of the owners thereof.

W. RAYMOND LEE, Sup't.

**BRANCH RAILROAD and STAGES** connecting with the Boston and Providence Railroad.

Stages connect with the Accommodation trains at the Foxboro' Station, to and from Woonsocket. At the Seekonk Station, to and from Lonsdale, R. I. via Pawtucket. At the Sharon Station, to and from Walpole, Mass. And at Dedham Village Station, to and from Medford, via Medway, Mass. At Providence, to and from Bristol, via Warren, R. I.—Taunton, New Bedford and Fall River cars run in connection with the accommodation trains.

## BOSTON AND MAINE RAILROAD.

Upper Route, Boston to Portland via, Reading, Andover, Haverhill, Exeter, Dover, Great Falls, South & North Berwick, Wells, Kennebunk and Saco.

Winter Arrangement, 1846-7.

On and after October 5th, 1846, Passenger Trains will leave daily, (Sundays excepted,) as follows:

Boston for Portland at 7½ a.m. and 2½ p.m.  
Boston for Great Falls at 7½ a.m., 2½ and 3-25 p.m.

Boston for Haverhill at 7½ and 11½ a.m., 2½, 3-25 and 5 p.m.

Boston for Reading at 7½ and 11½ a.m., 2½, 3-25 and 6½ p.m.

Portland for Boston at 7½ a.m., and 3 p.m.

Great Falls for Boston at 6½ and 9½ a.m., and 4½ p.m.

Haverhill for Boston at 7½, 8½, and 11 a.m. and 3 and 6½ p.m.

Reading for Boston at 7, 8½ and 9½ a.m., 12 m., 1½, 4 and 7½ p.m.

The Depot in Boston is on Haymarket Square.

Passengers are not allowed to carry Baggage above \$50 in value, and that personal Baggage, unless notice is given, and an extra amount paid, at the rate of the price of a Ticket for every \$500 additional value.

CHAS. MINOT, Super't.

## THE BEST RAILROAD ROUTE TO THE

Lake and Buffalo, from Cincinnati.

Take Cars to Xenia, 65

miles; take Stage to Mansfield, 68 miles; thence by Cars to Sandusky, 56 miles to the Lake; thence Steamboat to Buffalo, 230 miles.

Fare from Cincinnati to Sandusky.....\$8 00

" " Sandusky to Buffalo, Cabin..... 6 00

" " " " " Steerage..... 4 50

Fare by this route, although the cheapest across the state, will be reduced in a short time, railroad lengthened, and speed increased.

Leave Cincinnati in the morning, arrive at Columbus at night.

Leave Columbus in the morning, arrive at Sandusky same day.

Leave Sandusky, by Boat, in the morning, arrive at Buffalo next morning in time for the Cars north and east for Niagara Falls, Canada, Saratoga Springs, Troy, Albany, Boston, New York, Washington, or Philadelphia.

Passengers should not omit to pay their fare through from Cincinnati to Sandusky, or from Columbus to Sandusky via Mansfield; as this route is the only one that secures 56 miles [this road is run over in 2h. 50m.] most railroad which is new, and is the shortest, cheapest and most expeditious across the state.

Fares on the New York railroads are about to be reduced.

B. HIGGINS, Sup't, etc.

M. & S. C. R. R. Co.

Sandusky, Ohio.

## SUMMER ARRANGEMENT.—NEW YORK

AND ERIE RAILROAD LINE, from April

1st until further notice, will

run daily (Sundays excepted) between the city of New York and Middletown,

Goshen, and intermediate places, as follows:

FOR PASSENGERS—

Leave New York at 7 A. M. and 4 P. M.

" Middletown at 6½ A. M. and 5½ P. M.

FARE REDUCED TO \$1 25 to Middletown—way in proportion. Breakfast, supper and berths can be had on the steamboat.

FOR FREIGHT—

Leave New York at 5 P. M.

" Middletown at 12 M.

The names of the consignee and of the station where to be left, must be distinctly marked upon each article shipped. Freight not received after 5 P. M. in New York.

Apply to J. F. Clarkson, agent, at office corner of Duane and West sts. H. C. SEYMOUR, Sup't. March 25th, 1846.

Stages run daily from Middletown, on the arrival of the afternoon train, to Milford, Carbondale, Honesdale, Montrose, Towanda, Owego, and West; also to Monticello, Windsor, Binghamton, Ithaca, etc., etc. Agent on board. 13 if

## NORWICH AND WORCESTER RAILROAD.

Summer Arrangement, commencing Monday, April 6, 1846.

Accommodation Trains, daily,

except Sunday. Leave Norwich at 6 a.m., and 4½ p.m. Leave Worcester, at 10 a.m., and 4½ p.m.

The morning Accommodation Trains from Norwich, and from Worcester, connect with the trains of the Boston, and Worcester and Western railroads each way.

The Evening Accommodation Train from Worcester connects with the 4½ p.m. train from Boston.

New York Train via Long Island Railroad: Leave Allyn's Point for Boston, about 1 p.m., daily, except Sunday.

Leave Worcester for New York, about 10 a.m., stopping at Webster, Danielsonville, and Norwich.

New York Train via Steamboat—Leave Norwich for Boston, every morning, except Monday, on the arrival of the steamboat from New York, stopping at Norwich and Danielsonville.

Leave Worcester for New York, upon the arrival of the train from Boston, at about 4½ p.m., daily, except Sunday, stopping at Webster, Danielsonville and Norwich.

Freight Trains daily each way, except Sunday.—Special contracts will be made for cargoes, or large quantities of freight, on application to the superintendent.

Fares are Less when paid for Tickets than when paid in the Cars.

J. W. STOWELL, Sup't.

# TROY RAILROADS.—IMPORTANT NOTICE.—Troy and Greenbush Railroad, forming a continuous track from Boston

to Buffalo and Saratoga Springs. This road is new, and laid with the heaviest iron H rail. Trains will always be run on this road connecting at Greenbush each way with the trains to and from Boston and intermediate places, leaving Greenbush daily at 11 a.m. and 6 p.m., or on arrival of the trains from Boston; leave Troy at 7 1/2 a.m. and 4 1/2 p.m., or to connect with trains to Boston.

Trains also run hourly on this road between Troy and Albany. Running time between Greenbush and Troy, 15 minutes.

## TROY AND SCHENECTADY RAILROAD.

This road is laid its entire length with the heaviest H rail—which is not the fact with the road from Albany. Trains will always be run on this road connecting each way, to and from Buffalo and intermediate places. Leave Troy for Buffalo at 7 1/2 a.m. and 1 p.m. and 6 1/2 p.m., or to connect with the trains for the west; leave Schenectady at 2 1/2 a.m., 8 1/2 a.m., 1 p.m. and 3 1/2 p.m., or on arrival of the trains from Buffalo and intermediate places.

## TROY AND SARATOGA RAILROAD.

THE ONLY DIRECT ROUTE.

No change of passenger, baggage or other cars on this route. Cars leave Troy for Ballston, Saratoga Springs, Lake George and White Hall at 7 1/2 a.m., (arriving one hour in advance of the train from Albany,) and at 3 1/2 p.m. Returning, leave Saratoga at 9 a.m. and 3 1/2 p.m., (reaching Troy in time for the evening boats to New York.) Cars also leave Troy for the Burroughs at 3 1/2 p.m. and 7 p.m., connecting with packet boats for the north. This takes passengers from New York and Boston to Montreal in 44 hours.

N.B. Travellers will find the routes through Troy most convenient and economical, and as expeditious as any other. The steamboats to and from New York land within a few steps of the railroad office, and passengers are taken up and landed by the different railroad lines at the doors of principal hotels, thus saving all necessity for, and annoyance from, hack drivers, cabmen, runners, etc.

Aug 3, 1846.

1y 32

## BALTIMORE AND OHIO RAILROAD.

Great Western Mail leaves Baltimore every morning at 7 1/2 and

Cumberland at 8 o'clock, passing Ellicott's Mills, Frederick, Harpers Ferry, Martinsburg and Hancock, connecting daily each way with the Washington Trains at the Relay House seven miles from Baltimore, with the Winchester Trains at Harpers Ferry—with the various railroad and steamboat lines between Baltimore and Philadelphia and with the lines of Post Coaches between Cumberland and Wheeling and the fine Steamboats on the Monongahela Slack Water between Brownsville and Pittsburgh. Time of arrival at both Cumberland and Baltimore 5 1/2 P. M. Fare between those points \$7, and 4 cents per mile for less distances. Fare through to Wheeling \$11 and time about 36 hours, to Pittsburgh \$10, and time about 32 hours. Through tickets from Philadelphia to Wheeling \$13, to Pittsburgh \$12. Extra train daily except Sundays from Baltimore to Frederick at 4 P. M., and from Frederick to Baltimore at 8 A. M.

## WASHINGTON BRANCH.

Daily trains at 9 A. M. and 5 P. M. and 12 at night from Baltimore and at 6 A. M. and 5 1/2 P. M. from Washington, connecting daily with the lines North, South and West, at Baltimore, Washington and the Relay house. Fare \$1 60 through between Baltimore and Washington, in either direction, 4 cents per mile for intermediate distances. 1y49

THE SUBSCRIBER IS PREPARED TO execute at the Trenton Iron Works, orders for Railroad Iron of any required pattern, and warrant equal in every respect in point of quality to the best American or imported Rails. Also on hand and made to order, Bar Iron, Braziers and Wire Rods, etc., etc.

PETER COOPER 17 Burling Slip.

1y10

New York.

## NEW RAILROAD ROUTE FROM BUFFALO TO CINCINNATI.

Passengers destined for Columbus and Cincinnati, Louisville, Ky., St. Louis, Mo., Memphis, Tenn., Vicksburg, Natchez, New Orleans, and all intermediate ports, will find a new, and the most expeditious and comfortable Route, by taking Steamboats at Buffalo, landing at Sandusky City, Ohio, distance..... 330 miles.

From thence by Cars, over the Mansfield Railroad which is new and just opened [laid with heavy iron,] to Mansfield, distance..... 56 " Thence by Stage via Columbus to Xenia over gravel and Macadamized Road, (the best in the state,) in new coaches, distance..... 88 " Thence, over the Little Miami Railroad, from Xenia to Cincinnati, distance.... 65 "

## TIME.

From Buffalo to Sandusky..... 24 hours. Leave Sandusky 5 a.m. to Columbus.... 14 " From Columbus to Cincinnati..... 15 " Or say 30 hours from Sandusky to Cincinnati over this route, including delays.

## FARE.

From Buffalo to Sandusky, Cabin..... \$6 00 " " " Steerage..... 3 00 " Sandusky to Columbus..... 4 50 " " through to Cincinnati..... 8 00

Passengers should not omit to pay their fare through from Sandusky City to Cincinnati and take receipts availing themselves of the benefit of a contract existing between the said Railroad and Stage Co's, securing 121 miles travel by good Railroad and 86 miles by Stage, in crossing from Lake Erie to the Ohio river, in the space of 30 hours.

Passengers destined for St. Louis, or any point below on the Mississippi, will save by taking this route, from 4 to 6 days time and travel, and nearly half the expense, over the Chicago and Peoria route to the above places.

Fare by this route, although the cheapest, will in a short time be reduced, Railroad lengthened, and speed increased.

B. HIGGINSON, Supt., etc.

M. & S. C. R. R. Co.

Sandusky City, Ohio.

## NEW YORK & HARLEM RAILROAD CO.—Winter Arrangement.

On and after Monday, November 23, 1846, the cars will run as follows:

Leave 27th street for 42d street, Deaf and Dumb Institute, Yorkville, Harlem Morrisiana, and Williams' Bridge, at 7 o'clock a.m. From City Hall for above named places, 2 p.m. [freight train,] 2 30 p.m. 5 p.m. to Morrisiana only.

Leave City Hall for Harlem, Morrisiana, Fordham and Williams' Bridge, at 7 45 a.m., and 10 45 a.m.; 1 15 p.m., 2 p.m. [freight train,] 2 30 p.m. and 3 45 p.m.

Leave City Hall for Hunt's Bridge, Bronx, Tuckahoe, Hart's Corners White Plains, Davis' Brook, Unionville and Pleasantville, [Pleasantville 4 miles from Sing Sing,] 7 45 and 10 45 a.m.; 1 15 p.m., 2 p.m. [freight train,] and 3 45 p.m.

## RETURNING.

Leave Pleasantville, at 8, 10, [freight train,] and 11 a.m.; 1 30, and 4 p.m.

Leave White Plains, at 8 12, 10 30, [freight train] and 11 20 a.m.; 1 50, and 4 20 p.m.

Leave Tuckahoe, 8 35, 10 55, [freight train,] and 11 35 a.m.; 2 05, and 4 35 p.m.

Leave Williams' Bridge at 7 45, 8 50 and 11 50 a.m.; 2 10, 4, and 4 50 p.m.

Leave Morrisiana 8 and 9 05 a.m.; 12 05, 2 35, 1 20, 5 05 and 6 p.m.

Leave Yorkville, at 6 19 a.m.; 4 35 and 6 15 p.m.

## SUNDAY ARRANGEMENTS.

Leave City Hall for Pleasantville and intermediate places, at 7 45 a.m.; 1 15 and 3 p.m.

Leave Pleasantville for City Hall, at 8 a.m.; 11, and 3 15 p.m.

Leave City Hall for Williams' Bridge and intermediate places, 10 45 a.m.; 2 30 p.m.

Leave Williams' Bridge for City Hall, at 8 50 and 11 50 a.m.; 1, 3 45 and 4 05 p.m. 1y49

## BALTIMORE AND SUSQUEHANNA RAILROAD.—Reduction of Fare. Morning and Afternoon Trains between Baltimore and York.—The Passenger

trains run daily, except Sunday, as follows: Leaves Baltimore at..... 9 a.m. and 3 1/2 p.m. Arrives at..... 9 a.m. and 6 1/2 p.m. Leaves York at..... 5 a.m. and 3 p.m. Arrives at..... 12 1/2 p.m. and 8 p.m. Leaves York for Columbia at..... 1 1/2 p.m. and 8 a.m. Leaves Columbia for York at..... 8 a.m. and 2 p.m.

## FARE.

Fare to York..... \$1 50 " Wrightsville..... 2 00 " Columbia..... 2 12 1/2

Way points in proportion.

## PITTSBURG, GETTYSBURG AND HARRISBURG.

Through tickets to Pittsburg via stage to Harrisburg..... \$9 Or via Lancaster by railroad..... 10 Through tickets to Harrisburg or Gettysburg... 3 In connection with the afternoon train at 3 o'clock, a horse car is run to Green Spring and Owings' Mill, arriving at the Mills at..... 5 1/2 p.m. Returning, leaves Owings' Mills at..... 7 a.m.

D. C. H. BORDLEY, Supt.

31 1y Ticket Office, 63 North St.

## LEXINGTON AND OHIO RAILROAD.

Trains leave Lexington for Frankfort daily, at 5 o'clock a.m., and 3 p.m. Trains leave Frankfort for Lexington daily, at 8 o'clock a.m. and 2 p.m. Distance, 28 miles. Fare \$1 25.

On Sunday but one train, 5 o'clock a.m. from Lexington, and 2 o'clock p.m. from Frankfort.

The winter arrangement (after 15th September to 15th March) is 6 o'clock a.m. from Lexington, and ma. 9. from Frankfort, other hours as above.

35 1y

## SOUTH CAROLINA RAILROAD.—A Passenger Train runs daily from Charleston,

on the arrival of the boats from Wilmington, N. C., in connection with trains on the Georgia, and Western and Atlantic Railroads—and by stage lines and steamers connects with the Montgomery and West Point, and the Tuscumbia Railroad in N. Alabama. Fare through from Charleston to Montgomery daily..... \$36 50

Fare through from Charleston to Huntsville, Decatur and Tuscumbia..... 22 00

The South Carolina Railroad Co. engage to receive merchandise consigned to their order, and to forward the same to any point on their road; and to the different stations on the Georgia and Western and Atlantic railroad; and to Montgomery, Ala., by the West Point and Montgomery Railroad. 1y25

JOHN KING, Jr. Agent.

## CENTRAL RAILROAD—FROM SAVANNAH to Macon. Distance 190 miles.

This Road is open for the transportation of Passengers and Freight. Rates of Passage, \$8 00. Freight—

On weight goods generally... 50 cts. per hundred. On measurement goods..... 13 cts. per cubic ft.

On brls. wet (except molasses and oil)..... \$1 50 per barrel. On brls. dry (except lime).... 80 cts. per barrel.

On iron in pigs or bars, castings for mills, and unboxed machinery..... 40 cts. per hundred.

On hhd. and pipes of liquor, not over 120 gallons..... \$5 00 per hhd.

On molasses and oil..... \$6 00 per hhd.

Goods addressed to F. WINTER, Agent, forwarded free of commission. THOMAS PURSE,

y40 Gen'l. Supt. Transportation.

## MANUFACTURE OF PATENT WIRE

Rope and Cables for Inclined Planes, Standing Ship Rigging, Mines, Cranes, Tiller, etc., by JOHN A. ROEBLING, Civil Engineer, Pittsburgh, Pa.

These Ropes are in successful operation on the planes of the Portage Railroad in Pennsylvania, on the Public Slips, on Ferries and in Mines. The first rope put upon Plane No. 3, Portage Railroad, has now run 4 seasons, and is still in good condition. 2y19 1y

**CENTRAL AND MACON AND WESTERN** Railroads, Ga.—These Roads with the Western and Atlantic Railroad of the State of Georgia, form a continuous line from Savannah to Oothcaloga, Ga., of 371 miles, viz:

Savannah to Macon—Central Railroad ..... 190 Miles.  
Macon to Atlanta—Macon and Western.....101  
Atlanta to Oothcaloga—Western and Atlantic.. 80

Goods will be carried from Savannah to Atlanta and Oothcaloga, at the following rates, viz:

	To Atlanta	To Oothcaloga
On Weight Goods—Sugar, Coffee, Liquor, Bagging, Rope, Butter, Cheese, Tobacco, Leather, Hides, Cotton Yarns, Copper, Tin, Bar & Sheet Iron, Hollow Ware & Castings.....	\$0 50	\$0 75
Flour, Rice, Bacon in Casks or boxes, Pork, Beef, Fish, Lard, Tallow, Beeswax, Mill Gearing, Pig Iron and Grind Stones.....	0 50	0 62½
On Measurement Goods—Boxes of Hats, Bonnets and Furniture, per cubic foot.....	0 20	0 26
Boxes and Bales of Dry Goods, Saddlery, Glass, Paints, Drugs and Confectionary, per cubic foot.....	0 20	pr. 100lbs. 35
Crockery, per cubic foot.....	0 15	" " 35
Molasses and Oil, per hhd., (smaller casks in proportion).	9 00	12 50
Ploughs, (large,) Cultivators, Corn Shellers, and Straw Cutters, each.....	1 25	1 50
Ploughs, (small,) and Wheelbarrows.....	0 80	1 05
Salt, per Liverpool Sack.....	0 70	0 95
Passage—Savannah to Atlanta, \$10; Children, under 12 years of age, half price, Savannah to Macon, \$7.		

Goods consigned to the subscriber will be forwarded free of Commissions.

Freight may be paid at Savannah, Atlanta or Oothcaloga.

F. WINTER, Forwarding Agent, C. R. R. Savannah, Aug. 15th, 1846. 1y34

**GREAT SOUTHERN MAIL LINE! VIA** Washington city, Richmond, Petersburg, Weldon and Charleston, S. C., direct to New Orleans. The only Line which carries the Great Southern Mail, and Twenty-four Hours in advance of Bay Line, leaving Baltimore same day.

Passengers leaving New York at 4½ P.M., Philadelphia at 10 P.M., and Baltimore at 6½ A.M., proceed without delay at any point, by this line, reaching Richmond in eleven, Petersburg in thirteen and a half hours, and Charleston, S. C., in two days from Baltimore.

Fare from Baltimore to Charleston.....\$21 00  
" " " Richmond..... 6 60

For Tickets, or further information, apply at the Southern Ticket Office, adjoining the Washington Railroad Office, Pratt street, Baltimore, to STOKTON & FALLS, Agents.

**RAILROAD SCALES.—THE ATTENTION** of Railroad Companies is particularly requested to Ellicott's Scales, made for weighing loaded cars in trains, or singly, they have been the inventors, and the first to make platform scales in the United States; supposing that an experience of 20 years has given a knowledge and superior advantage in the business.

The levers of our scales are made of wrought iron, all the bearers and fulcrums are made of the best cast steel, laid on blocks of granite, extending across the pit, the upper part of the scale only being made of wood. E. Ellicott has made the largest Railroad Scale in the world, its extreme length was one hundred and twenty feet, capable of weighing ten loaded cars at a single draft. It was put on the Mine Hill and Schuylkill Haven Railroad.

We are prepared to make scales of any size to weigh from five pounds to two hundred tons.

ELLICOTT & ABBOTT.  
Factory, 9th street, near Coates, cor. Melon st.  
Office, No. 3 North 5th street,  
Philadelphia, Pa. 1y25

**GEORGIA RAILROAD. FROM AUGUSTA to ATLANTA—171 MILES.**  
AND WESTERN AND ATLANTIC RAILROAD FROM ATLANTA TO OOTHCALOGA, 80 MILES.

This Road in connection with the South Carolina Railroad and Western and Atlantic Railroad now forms a continuous line, 388 miles in length, from Charleston to Oothcaloga on the Oostenaula River, in Cass Co., Georgia.

#### RATES OF FREIGHT.

	Between Augusta and Oothcaloga, 80 miles.	Between Charleston and Oothcaloga, 388 miles.
1st class. Boxes of Hats, Bonnets, and Furniture, per cubic foot.....	\$0 16	\$0 25
2d class. Boxes and Bales of Dry Goods, Saddlery, Glass, Paints, Drugs and Confectionary, per 100 lbs.	0 90	1 40
3d class. Sugar, Coffee, Liquor, Bagging, Rope, Cotton Yarns, Tobacco, Leather, Hides, Copper, Tin, Bar and Sheet Iron, Hollow Ware, Castings, Crockery, etc.	0 55	0 75
4th class. Flour, Rice, Bacon, Pork, Beef, Fish, Lard, Tallow, Beeswax, Feathers, Ginseng, Mill Gearing, Pig Iron, and Grindstones, etc.....	0 37½	0 62½
Cotton, per 100 lbs.....	0 45	0 65
Molasses, per hogshead.....	8 50	13 50
" " barrel.....	2 00	3 25
Salt per bushel.....	0 17	
Salt per Liverpool sack.....		95
Ploughs, Corn Shellers, Cultivators, Straw Cutters, Wheelbarrows....	0 75	1 37

German or other emigrants, in lots of 20 or more, will be carried over the above roads at 2 cents per mile.

Goods consigned to S. C. Railroad Co. will be forwarded free of commissions. Freight may be paid at Augusta, Atlanta, or Oothcaloga.

J. EDGAR THOMSON,  
Ch. Eng. and Gen. Agent.  
Augusta, Sept. 2d, 1846. \*44 1y

**THE WESTERN AND ATLANTIC** Railroad.—This Road is now in operation to Oothcaloga, a distance of 80 miles, and connects daily (Sundays excepted) with the Georgia Railroad.

From Kingston, on this road, there is a tri-weekly line of stages, which leave on the arrival of the cars on Tuesday, Thursday and Saturday, for Warrenton, Huntsville, Decatur and Tusculumbia, Alabama, and Memphis, Tennessee.

On the same days, the stages leave Oothcaloga for Chattanooga, Jasper, Murfreesborough, Knoxville and Nashville, Tennessee.

This is the most expeditious route from the east to any of these places.

CHAS. F. M. GARNETT,  
Chief Engineer.  
Atlanta, Georgia, April 16th, 1846. 1y1

**TWO RAILROAD COMPANIES AND MANUFACTURERS** of railroad Machinery. The subscribers have for sale Am. and English bar iron, of all sizes; English blister, cast, shear and spring steel; Juniata rods; ear axles, made of double refined iron; sheet and boiler iron, cut to pattern; tiers for locomotive engines, and other railroad carriage wheels, made from common and double refined B. O. iron; the latter a very superior article. The tires are made by Messrs. Baldwin & Whitney, locomotive engine manufacturers of this city. Orders addressed to them, or to us, will be promptly executed.

When the exact diameter of the wheel is stated in the order, a fit to those wheels is guaranteed, saving to the purchaser the expense of turning them out inside.

THOMAS & EDMUND GEORGE,  
E. cor. 19th and Market sts., Philad., Pa. 1y

**LITTLE MIAMI RAILROAD.—OPEN** TO SPRINGFIELD—Distance 84 miles—

connecting at Xenia and Springfield with Messrs. Neil, Moore, & Co's. daily daylight lines of stages going east and north, to Columbus, Zanesville, Wheeling, Cleveland, and Sandusky City, via Urbana, Bellefontaine, Kenton, and the Mad river and lake Erie railroad, or Columbus, Delaware, and the Mansfield and Sandusky City railroad—forming, by these connections, the cheapest and most expeditious route to Buffalo, Niagara Falls, Rochester, Albany, New York, and Boston.

On and after Thursday, August 13, 1846, until further notice, a Passenger train will run as follows:

Leave Cincinnati daily at 9 A. M., for Milford, Foster's Crossing, Deerfield, Morrow, Fort Ancient, Freeport, Waynesville, Spring Valley, Xenia, Old Town, Yellow Springs, and Springfield.

Returning, will leave Springfield at 4 hours 35 minutes A. M. A line of Hacks runs in connection with the Cars, between Deerfield and Lebanon.

FARE—From Cincinnati to Lebanon....\$1 00  
" " " Xenia..... 1 50  
" " " Springfield... 2 00  
" " " Columbus... 4 00  
" " " Sandusky city 8 00

The Passenger trains runs in connection with Strader & Gorman's line of Mail Packets to Louisville.

Tickets can be procured at the Broadway Hotel, Dennison House, or at the Depot of the Company, on East Front street.

Further information and through tickets for the Stage lines, may be procured at P. Campbell, Agent on Front street, near Broadway.

The company will not be responsible for baggage beyond 50 dollars in value, unless the same is returned to the conductor or agent, and freight paid at a passage for every \$500 in value over that amount.

The 1½ P. M. train from Cincinnati, and the 9 40 P. M. train from Xenia, will be discontinued on and after Monday, the 10th instant.

A freight train will run daily.  
47½ W. H. CLEMENT, Sup't.

**PHILADELPHIA, WILMINGTON & BALTIMORE RAILROAD.—1847.**

Winter Arrangement.

Philadelphia for Baltimore... 8 a.m. and 4 p.m.  
Baltimore for Philadelphia... 9 a.m. and 8 p.m.

Connecting in Baltimore with Mail Lines south and west, as per notice of the Baltimore and Ohio Railroad—and with Mail Lines north from Philadelphia, both morning and afternoon.

Sundays, the Morning Lines do not run in either direction.

Accommodation train from Wilmington to Philadelphia, leaves Wilmington at 8 a.m., and returns at 2 p.m.

J. R. TRIMBLE,  
Eng. and General Superintendent.

**LAWRENCE'S ROSENDALE HYDRAULIC** Cement. This cement is warranted equal to any manufactured in this country, and has been pronounced superior to Francis' "Roman." Its value for Aqueducts, Locks, Bridges, Floors and all Masonry exposed to dampness, is well known, as it sets immediately under water, and increases in solidity for years.

For sale in lots to suit purchasers, in tight papered barrels, by JOHN W. LAWRENCE,  
142 Front street, New York.

Orders for the above will be received and promptly attended to at this office. 32 1y

**SPRING STEEL FOR LOCOMOTIVES,** Tenders and Cars. The Subscriber is engaged in manufacturing Spring Steel from 1½ to 6 inches in width, and of any thickness required: large quantities are yearly furnished for railroad purposes, and wherever used, its quality has been approved of. The establishment being large, can execute orders with great promptitude, at reasonable prices, and the quality warranted. Address

JOAN F. WINSLOW, Agent,  
Albany Iron and Nail Works,

**VALUABLE PROPERTY ON THE MILL Dam For Sale.** A lot of land on Gravelly Point, so called, on the Mill Dam, in Roxbury fronting on and east of Parker street, containing 68,497 square feet, with the following building thereon standing.

Main brick building, 120 feet long, by 46 ft wide two stories high. A machine shop, 47x43 feet, with large engine, face, screw, and other lathes, suitable to do any kind of work.

Pattern shop, 35x32 ft. with lathes, work benches.

Work shop, 86x35 feet, on the same floor with the pattern shop.

Forge shop, 118 feet long by 44 feet wide on the ground floor, with two large water wheels, each 16 feet long, 9 ft diameter, with all the gearing, shafts, drums, pulleys, &c., large and small trip hammers, furnaces, forges, rolling mill, with large balance wheel and a large blowing apparatus for the foundry.

Foundry, at end of main brick building, 60x45 ft two stories high, with a shed part 45x20 feet, containing a large air furnace, cupola, crane and corn oven.

Store house—a range of buildings for storage, etc., 200 feet long by 20 wide.

Locomotive shop, adjoining main building, fronting on Parker street, 51x25 feet.

Also—A lot of land on the canal, west side of Parker st., containing 6000 feet, with the following buildings thereon standing:

Boiler house 50 feet long by 30 feet wide, two stories.

Blacksmith shop, 49 feet long by 20 feet wide.

For terms, apply to HENRY ANDREWS, 48 State st., or to CURTIS, LEAVENS & CO., 106 State st., Boston, or to A. & G. RALSTON & Co., Philadelphia. ja4

**TO RAILROAD COMPANIES AND BUILDERS OF MARINE AND LOCOMOTIVE ENGINES AND BOILERS.**

#### PASCAL IRON WORKS.

##### WELDED WROUGHT IRON TUBES

From 4 inches to 4 ft in calibre and 3 to 12 feet long, capable of sustaining pressure from 400 to 2500 lbs. per square inch, with Stop Cocks, T. L., and other fixtures to suit, fitting together, with screw joints, suitable for STEAM, WATER, GAS, and for LOCOMOTIVE and other STEAM BOILER FLUES.

Manufactured and for sale by  
**MORRIS, TASKER & MORRIS.**  
Warehouse S. E. Corner of Third & Walnut Streets,  
PHILADELPHIA.

#### PATENT INDESTRUCTIBLE WATER

Pipes. The subscribers continue to manufacture the above Pipes, of all the sizes and strength required for City or Country use, and would invite individuals or companies to examine its merits.—This pipe, unlike cast iron and lead, imparts neither color, oxide or taste, being formed of strongly riveted sheet iron, and evenly lined on the inside with hydraulic cement. While in the process of laying, it has a thick covering externally of the same—thus forming nature's own conduit of stone. The iron being thoroughly enclosed on both sides with cement, precludes the possibility of rust or decay, and renders the pipe truly indestructible. The prices are less than those of iron or lead. We also manufacture Basins and D. Traps, for Water Closets, on a new principle, which we wish the public to examine at 112 Fulton street, New York.

281f

J. BALL & CO.

**TO LOCOMOTIVE AND MARINE ENGINE BOILER BUILDERS.** Pascal Iron Works, Philadelphia. Welded Wrought Iron Flues, suitable for Locomotives, Marine and other Steam Engine Boilers, from 2 to 5 inches in diameter. Also, Pipes for Gas, Steam and other purposes; extra strong Tube for Hydraulic Presses; Hollow Pistons for Pumps of Steam Engines, etc. Manufactured and for sale by

**MORRIS TASKER & MORRIS,**  
Warehouse S. E. corner 3d and Walnut Sts., Philadelphia. 11f

## NORRIS' LOCOMOTIVE WORKS.

BUSH HILL, PHILADELPHIA, Pennsylvania.

**MANUFACTURE** their Patent 6 Wheel Combined and 8 Wheel Locomotives of the following descriptions, viz:

Class 1,	15 inches Diameter of Cylinder,	× 20 inches Stroke.
" 2,	14 " " " " " "	× 24 " "
" 3,	14½ " " " " " "	× 20 " "
" 4,	12½ " " " " " "	× 20 " "
" 5,	11½ " " " " " "	× 20 " "
" 6,	10½ " " " " " "	× 18 " "

With Wheels of any dimensions, with their Patent Arrangement for Variable Expansion. Castings of all kinds made to order: and they call attention to their Chilled Wheels, for the Trucks of Locomotives, Tenders and Cars.

**NORRIS, BROTHERS.**

#### THE NEWCASTLE MANUFACTURING

Company continue to furnish at the Works, situated in the town of Newcastle, Del., Locomotive and other steam engines, Jack screws, Wrought iron work and Brass and Iron castings, of all kinds connected with Steamboats, Railroads, etc.; Mill Gearing of every description; Cast wheels (chilled) of any pattern and size, with Axles fitted, also with wrought tires, Springs, Boxes and bolts for Cars; Driving and other wheels for Locomotives.

The works being on an extensive scale, all orders will be executed with promptness and despatch. Communications addressed to Mr. William H. Dobbs, Superintendent, will meet with immediate attention. **ANDREW C. GRAY,**  
345 President of the Newcastle Manuf. Co.

#### RAILROAD IRON AND LOCOMOTIVE

Tyres imported to order and constantly on hand by **A. & G. RALSTON**  
Mar. 201f 4 South Front St., Philadelphia.

#### KEARNEY FRIE BRICK. F. W.

BRINLEY, Manufacturer, Perth Amboy, N. J. Guaranteed equal to any, either domestic or foreign. Any shape or size made to order. Terms, 4 mos. from delivery of brick on board. Refer to

**CONSTRUCTION.**

Since the last annual report, the capital has been increased by creating 4000 shares, which have been disposed of agreeably to the Act of March 25, 1845.

The total means provided for construction and equipment of road have been

34,000 shares at \$100 each.....	\$3,400,000 00
£135,000 sterl. bonds, payable with interest at 5 pr ct. April 1, 1868.	
337,500 " Oct. 1, 1868.	
90,000 " Oct. 1, 1869.	
180,000 " April 1, 1870.	
157,400 " April 1, 1871.	

£899,900 average due July 5, 1869....	\$3,999,555 56
Albany city bonds payable with interest at 6. per ct. July 1, 1866.	\$250,000
" July 1, 1870.	300,000
" July 1, 1871.	200,000
" July 1, 1876.	250,000—\$1,000,000 00

\$8,399,555 56

Am't paid to Albany sinking fund.....\$100,000 00

Am't paid income for money previously paid into the sinking fund, as per act of March 25, '45 114,736 68

Am't accrued to the sinking fund Nov. 30, 1846, but not due until January 1, 1847..... 45,833 34

Total am't paid for construction and equipment of road (see table A).....8,185,788 42—\$8,446,358 44

Excess of funds expended over am't provided..... \$46,802 88

It will be perceived by reference to the annexed table marked A, that \$296,079 11 has been expended for construction and equipment of the Western and Albany and West Stockbridge railroads during the eleven months ending November 30, 1846, and that most of it has been expended for engines, cars, land, and additional track.

The attention of the Directors was early called to the importance of providing more

efficient means for doing the business of the road; at which time it was decided to order six engines, in addition to the four then ordered, and 100 long eight wheeled freight cars, in addition to 90 previously contracted for, all of which have since been put upon the road, and most of the cost charged to construction.

**TABLE A.**  
*Table showing the Cost of the Western and Albany and West Stockbridge Railroads to November 30, 1846.*

Heads of Expenditures.	Amount paid to Dec. 31 1846. A. & W. S. Railroad.	Amount paid in 1846. A. & W. S. R. R.	Total Amount paid. Western Railroad.	A. & W. S. Railroad.	Total cost of both Roads.
Graduation and masonry.....	3,146,494 36	7,545 50	3,154,039 86	889,635 96	4,007,412 05
Bridging.....	163,736 23	1,161 66	163,736 23	293,796 65	1,347,760 11
Superstructure, including iron.....	1,031,686 08	524 83	1,054,033 46	175,173 92	425,505 93
Station buildings and fixtures.....	232,178 14	4,563 13	250,332 01	204,022 99	481,029 15
Land, land damage, and fencing.....	234,454 97	42,551 19	277,006 16	418,978 14	55,066 49
Locomotives.....	347,470 72	71,507 42	418,978 14	370,548 01	879,488 54
Passenger and baggage cars.....	50,418 02	4,648 47	55,066 49	213,637 93	6,185,788 42
Merchandise cars.....	249,018 41	122,529 60	370,548 01	1,776,197 45	
Engineering and other expenses.....	665,850 61		665,850 61		
	6,120,307 54	289,283 43	6,409,590 97		

It was also deemed essential that the turn-out tracks should be lengthened, where trains are liable to pass each other; and that a third track should be put down in front of the depots, for cars that may be stopping at the stations—which improvements have mostly been made, including about two miles of track from Pittsfield to the junction with the North Adams railroad.

Purchases of land have been made, during the season, at Worcester, East Brookfield, Palmer, Springfield, and Chatham, amounting to about \$40,000; but the quantity purchased has been limited to the necessary wants of the corporation.

By the provisions of the act of March 25, 1845, a further issue of 1500 shares of the capital stock can be made,

Which will amount to.....\$150,000 00  
Of this amount, there has already been expended for construction and equipment of the road.....\$46,802 88  
And there will be required to pay into the sinking funds..... 50,000 00—96,802 88

Which will leave for construction and equipment of the road..... \$53,197 12

By this exhibit, it will be seen that further provision to supply the means to be expended for construction the coming season, which deficiency, and the requirements of the road hereafter, can only be provided for by an increase of the capital stock.

The Pittsfield and North Adams railroad was considered as opened for public use on the 1st day of December, 1846, at which time the Western railroad company commenced operating it, under a lease of thirty years, the particulars of which have been previously reported.

**SINKING FUNDS.**

The Massachusetts fund was, as per last report, on the 1st of Jan. 1846. \$290,610 61  
Interest on dividends since received... 17,436 51  
Profit on sales of Providence railroad stock..... 1,234 25  
Dividends and interest accrued and not due..... \$,775 50  
Eleven-twelfths of \$10,000, accrued to Nov. 30, and not due till Jan. 1, '47 36,666 67

Total amount of Massachusetts fund. \$349,713 54  
The Albany city fund was, as per last report on 1st Jan. '46....169,876 60  
Interest accrued in 11 m's. to Nov. 30, 1846..... 10,900 50  
Eleven-twelfths of \$10,000, accrued to Nov. 30, 1846, but not due till January 1, 1847..... 9,166 67—189,945 17

Total value of both funds Nov. 30, '46 \$589,658 71  
From which deduct an amount which if put at compound interest Nov. 30, 1846, will produce \$319,964 44 when the sterling bonds average due, say July 5, 1869, being for exchange on maturity of scrip..... 85,720 00

Net value of the two fds Nov. 30, '46 \$453,938 71  
The value of the Massachusetts sinking fund will be, at the time the scrip averages due, provided nothing further should be added to it, reckoning compound interest at the rate of six per cent. per annum, say from Nov. 30, 1846, to July 5, 1869, 22 years, 7 months, 5 days..... 985,398 84

The value of the Albany sinking fund will be when the principal falls due, provided \$10,000 be added annually to the principal, with interest at the rate of six per cent. per annum, say from Nov. 30, 1846, to March 13th, 1871, 24 years, 3 months, 13 days.. 1,299,156 83

Total value of both funds when the principal falls due, provided nothing further be paid into the Massachusetts fund..... 2,284,555 67

The value of the Massachusetts fund will be, provided the law requiring 40,000 per annum to be added to it, reckoning compound interest at six per cent. per annum, when the principal falls due..... 2,783,286 22  
Add value of Albany fund, as stated above..... 1,299,156 83

Total value of both funds when average due..... 4,082,443 06

\* Six engines and four passenger cars are now building, which will cost \$57,500.

From the preceding statements it will appear that the affairs of the corporation are in a flourishing condition; and it affords the Directors much satisfaction to say, that the prospects of the road for the future are very encouraging. All of which is respectfully submitted.

Aldison Gilmore, Edmund Dwight, John Howard, Robert Campbell, Stephen Fairbanks, Josiah Stickney, Jonathan Chapman, Abraham H. Howland, James Russell,  
BOSTON, Jan. 11, 1847. Directors.

#### Foreign Iron Trade.—Items.

We clip from our exchanges, and other journals, received from Europe by the last arrival, the following items, in reference to the iron business abroad:

**Iron Trade and Railways of Belgium.**—A letter from Brussels, states that the iron trade of Belgium is receiving, from the extension of railways in that kingdom, a perceptible and unprecedented impulse. At the monthly meeting of the Ironmasters, held on the 8th inst., it was decided not to raise the price of pig iron; but all large orders at the present rate of £5 8l. per ton, taken at the works, are refused, and in some instances, an advance has been freely given, there being no stock to fall back upon. For rails, £12 16s. per ton, the other descriptions bar iron prices remain the same, and the rolling mills are fully occupied; altogether, the prospects of the trade are highly satisfactory.

In the *Moniteur Official*, which publishes a monthly list of the value of the shares in the various companies, there are some striking instances of the rapidly increasing value of all property connected with the iron trade of this country. Among others, the iron works of Sclessin, near Liege, the shares of which, on the 1st of January, were at 995f., are quoted on the 1st day of November last at 1200f., or 20 per cent. premium. The shares of l'Esperance were at 845 in January, they are quoted on the 1st of November, at 1425; but the most striking instance is the shares of Monceau iron works, situated at the northern terminus of the Sambre and Meuse railway. In January, the 1000f. shares were at 2000, and on the 1st of November 2300, with buyers. The 1000f. shares of the Providence Works, which are of more recent date, are quoted at 1500f. This company has just finished erecting a very large rolling mill on the borders of France, to avoid the present high duties on rolled iron.

The English Iron market has been rather animated during the week, owing to the Gt. Northern railway company having closed for about 45,000 tons of rails, out of 75,000 tons, for which they advertised. The contracts were taken by two eminent Welsh houses at a price equal to £9 12s. to £9 15s. at the works in Wales. It is reported the directors of the company were willing to have closed for the remaining 30,000 tons at the above rates. In Staffordshire and Welsh pig iron a very good business has been done during the week, at full prices; and owing to the large orders now in the market for railway chairs there is no doubt an extensive demand will take place ere long both for Welsh and Staffordshire pigs. Scotch pig iron has been in

good demand, and several sales made during the week, at prices varying from 72 to 74s., according to numbers. Swedish iron and steel are firm at quotations. English copper and tin remain unaltered. Banca and Straits are in fair request at quotations. English lead firm. Spelter for spring delivery has been sold at £19, and on the spot £19 12 6 has been paid. As the navigation is now closed, and our stock reduced to about 2000 tons, there is no doubt higher prices will be realized.—*Corresp. London Mining Journal.*

#### Roman Mining and Iron Foundry Society.

—At the present time, when the projected railways in the States of the Church are exciting general attention, as proofs of our internal resources for their formation, may be numbered the two establishments for the manufacture of iron, which, within a very short period, have risen to be unrivalled by any in Italy itself, and to compete in excellence with the most celebrated of other countries. We speak of the establishments of Tivoli and Terni; the one in the neighborhood of Rome and with the inexhaustible advantages derived from the waters of the Anio, has already two great machines, besides many other minor ones, for the fabrication of tools for the labors of the field, and instruments of every sort for weaving, of qualities so perfect and so much sought for as to supply not only the entire states of Rome, but also those external. The other establishment, that of Terni, receiving aliment from the river Velino, is a foundry supplied also with the most spacious premises, magazines and habitations for the laborers; machinery the most excellent, the springs and wheels of iron; eight large forges, four great mallets and two great pumps, with a cylinder of enormous dimensions: as yet the only one in Italy adapted for the fabrication of the rails, the latens, etc., for railways. Now these two establishments united together, and working in full activity, might easily fabricate iron, cast, beaten and wrought cylindrically, to the amount of 12,000,000 pounds weight per annum. The proprietors of both foundries, knowing from experience how much their interests were to be served by the increase of capital, have determined on forming an anonymous society, which vesting by means of actions the sum of 600,000 scudi, might make itself responsible for the two establishments, amplify the sphere of operations and carry on the working of the mines this country possesses. Accordingly was held, on the 15th November, the first general assembly of the society, at which about 200 assisted; it was in truth a convention of nobles, proprietors, merchants and artists, most goodly and honorable; the first occasion we believe when it has been shown how readily the Italians are to respond to the appeal of an industrial association, in the same degree as they have been to associate themselves for the purposes of benevolence whenever called to do so. In this assembly were initiated the measures for the direction of the society; a president was elected, the able and scientifically instructed duke, Don Mario Massimo; and two special commissioners were appointed for the revision of the statutes and contracts

that have relation to the government, etc., of the body. And thus, within a short time, we shall see it legally constituted, prospering and maintaining its important post, so as to administer to the necessities of the state, and to undertake the vast works of the railroads to which his Holiness Pius IX. has graciously acceded his protection; as he has also deigned to recognize as worthy, and bestowed his approbation upon, the objects of this honorable association.—*Roman Advertiser.*

**West of Scotland Iron Company.**—We lately visited the West of Scotland Company's Malleable Iron Works, at Motherwell, says the *Glasgow National Advertiser*, which have been only recently brought into operation. We believe that this establishment is not only the most extensive, but perhaps the best constructed malleable iron work in the kingdom. We found only part of the works in operation; but from the state of forwardness of the remaining portion, the whole will probably be at full work in a few months hence; when they will turn out 700 tons of rails weekly. The extent of the works may be conceived, when it is stated that they will manufacture 50,000 tons of pig iron, consume 100,000 tons of coals annually, and employ 1200 to 1500 men.

**Elginton Iron Works, Ayrshire.**—One of the three new furnaces, recently constructed here, was put into full blast a short time since—George Johnstone, Esq., of Redburn, presiding at its celebration. The others will soon follow. The building of a 4th furnace has already been commenced, and others are said to be contemplated.

**Contracts for Rails.**—Mr. Levick, of the eminent house of Crutwell, Allies & Co., of South Wales, attended in Dublin last week, and concluded contracts with the Gt. Southern and Western, the Dublin and Belfast Junction, and the Dundalk and Enniskillen companies, for the delivery in all of 15,000 tons of rails.

**Iron Trade.**—At a meeting of the proprietors of the Clay Cross Collieries, held at Derby a few days since, it was determined to open iron work, in conjunction with that colliery without delay. The circumstance of beds of iron, lime and coal, lying contiguous to each other at clay cross, will, it is supposed, render the undertaking very profitable.

☞ The *London Mining Journal* of December 15th, contains the following:

"I invite your particular attention to the following statement, the facts of which are borrowed from *Le Siecle*, some of whose writers are intimately connected with the railway alluded to:

"The Northern Railway company, after having vainly attempted to procure rails in France, demanded of the government permission to import 25,000 tons of rails from abroad. It did not demand to introduce this great quantity of iron free of duty, but contented itself with proposing to pay such a duty as should make the rails 350f. (£14!) a ton, which was what it paid last year. It calculated that it could procure rails in England at from 240 to 250f. a ton; that the

price of conveyance would be from 40 to 50*f.* a ton; and that a duty of from 50 to 60*f.* a ton would, under the peculiar circumstances, be accepted, instead of the modest 20*f.* a ton inscribed in the tariff. Such an arrangement would have yielded 12,500,000*f.* or 15,000,000*f.* (500,000 or £600,000 to the national exchequer, and would have done no harm to the ironmasters; for, be it repeated, the company had vainly attempted to procure in France the rails it demanded permission to introduce. Will you suppose, naturally enough, that the Minister of Commerce hesitated not one moment to accord the required permission? How, indeed, you will ask, should he, when he has every day under his nose official returns, showing what the ironmasters can produce, and what they have undertaken to supply—returns which prove most clearly that the greatest miracle on earth could not enable them to meet their engagements. But, ah! you don't know this good minister of commerce. Instead of ordering the custom house to be thrown open to the English rails at 50 or 60*f.* a ton, the worthy man sent to the committee, which the ironmasters have elected to preside over them, to ask what they had to say to the demand. The ironmasters, of course, with more than their brutal selfishness, unhesitatingly declared that the offer must not be accepted. It will seem incredible to you, that men who cannot do a thing, are determined to prevent others doing it; but, incredible though it be, such is really the truth of these iron monopolists of France. They, however, by way, probably, of gilding over their scandalous refusal, proposed to undertake, by clubbing among themselves, to supply the rails at 380*f.* the ton! But, it may be asked, could the company get the rails even at that exorbitant price? Most certainly they cannot, unless as the *Siecle* says, they import *fonte*, to fabricate them from Belgium or England; and, even if they import *fonte*, not the slightest reliance could be placed upon their promises or their treaties."

**American Orders.—The Iron and Birmingham Trade.**—A correspondent, writing from Birmingham, on Thursday evening, says—"I am glad to be able to state, that the commercial letters received here on Tuesday, from America by the *Britannia*, are of the most favorable description, and hold out prospects of such a demand for goods, as cannot fail to secure employment at remunerative prices in this district for some time to come. At all the houses, brisk orders have been received, with an assurance in some of the advices, that a very considerable increase in the demand may be fully expected in this and the month of January. At some establishments the orders for chains and heavy iron work is so great, that it is confidently asserted the manufacturers of these articles have now before them full twelve months' work. The most gratifying fact, however, connected with this demand is, that it is the result of low stocks in the United States, and not of speculation, which would render the returns doubtful. There is, therefore, but one thing which can at all interfere with these pleasing prospects—and that is an attempt to raise the

price of the raw material above the standard of the competitive market. It is now confidently asserted, by some persons in this locality well acquainted with the iron trade, that a rise in the prices will take place at next quarter day, and that this step will be fully justified by the increased foreign and home demand for manufactured goods, and the sustained railway consumption. On the other hand, I am authorised by one of the largest makers in South Staffordshire to state, that such an advance will not take place, but that the present prices will certainly be maintained. In proof of the sincerity of this opinion, my informant assured me he was prepared to take an order for 30,000 tons at the present prices; and if the opinions and actual position of the merchants and manufacturers be considered in the question, there would seem to be good reasons for the adoption of this course. A commercial letter now before me, from a large American house, says—"I send you an order for bar iron, at the quotations of the 19th of October, (the first after quarter day;) but if the price advances as high as 10*s.* per ton above this quotation, please omit the present order." Added to this, the universal opinion of all the merchants is, that if there is no advance, there will be a greatly increased demand for iron and made goods; but that, if there is an advance, the demand will inevitably be curtailed. Knowing the importance of this question at the present moment to a large body of commercial men, I have collected the best information upon the subject."

**Railway Statistics.**—The returns of the leading railways for the second half year of 1846, give the following comparisons and results, in round numbers:—London and North Western, 350 miles, with a capital or cost of £13,000,000; gross receipts, above £1,000,000; divided to shareholders, £543,929; paid £21,425 for local rates and taxes, and £24,582 for the government duty of five per cent. on passengers, besides property tax, income, stamps, etc., being equal to about nine per cent. on what the shareholders divided for rates and duty. Great Western, 222 miles; capital £8,000,000; gross receipts, £496,000; divided to shareholders, £301,807; paid £15,030 local rates, and £14,748 government tax, etc., equal to about ten per cent. on the shareholders' profit. The Midland railway, 178 miles; capital £7,250,000; gross receipts, £324,000; divided to shareholders, £170,000; paid £7130 for rates, and £6845 for government tax, besides, etc., or eight per cent. on dividend. The Manchester and Leeds, 84 miles; capital, £3,750,000; gross receipts, £153,000; 1,000,000 passengers; divided among shareholders, £86,470, after paying £4414 local rates, and £3464 duty, besides, etc., or ten per cent. On a rough estimate of the 12 leading English railways (those we have enumerated among the number) of 1250 miles (or at 10 acres per mile, 12,500 acres) there was paid for only half a year, £75,951 local rates, and £73,177 government tax on passengers, besides income tax, property tax, stamps, etc. Estimate that for a year, and we have £152,000 and £146,000 for these 12

railways, paid in reality by the public, to local and general taxation. Estimating the present railways at double that length of miles, gives 2500 miles, or 25,000 acres, paying about 96 times more than agricultural land, mills, or other property, which pay as many threepences as railways do pounds for the same extent of land to the local taxes, etc.

#### Cold Spring Iron Works.

On the Western bank of the river Thames, a mile and a quarter, perhaps, below Norwich Landing, beside the New London turnpike, stood, some time ago, a brewery and distillery. The ground is now redeemed for more beneficent uses, furnishing the site of the Cold Spring Iron Works. The business is carried on by a joint stock corporation, of which Mr. John Huntington is president. The building is of the most simple character, no other being requisite, of plain boards, one story high, like a blacksmith's shop, with sky lights, but without a floor. The sight of it reminded us of the Millerite tabernacle in Boston; and a glance at the works within by no means served to drive away the thoughts of the end of the world which the exterior had awakened. The establishment was first commenced in September, 1845. The preparations having been completed in April, 1846, the work was begun; but almost immediately afterwards was brought to a very sudden termination by the occurrence of a fire which consumed the building. In the month of June next following, the shop having been rebuilt, the work was resumed. The building is 117 feet by 55.

The business is the rolling of iron into bars by means of machinery, rather a novel one in this part of the country, and well worth a visit from strangers. The stock is scrap and pig iron. The first is collected in the vicinity; the pig is obtained at the greater markets. The whole is American.

From six to ten tons of coals a day are used; a fact which will help to give some just idea of the magnitude of the operations. The coal was formerly brought from Pennsylvania; but at present the Pictou and Sidney coal is employed to feed the fires.

Steam power is the kind used; the engine being of a hundred horse power. The manufactured iron amounts to about 1200 tons a year, representing a value of \$100,000 or more. Most of this is furnished to order; the remainder goes to the New York market. The mill is kept running on an average only five days in the week, by which time the furnace commonly needs repairs, and is suffered to cool for the purpose. From the steam produced in heating the iron, is made the power for rolling it. The engine was built by Hinckley & Drury of Boston. It is kept running day and night. We had almost forgotten to mention, that a no inconsiderable part of the business is the manufacturing of hoops for whaling casks.

The company employed about 40 men.—Some of these work by time, and some by the ton. They make good wages, getting, when the works are in operation, about two dollars a day.—*Norwich Courier.*

Correspondents will oblige us by sending in their communications by Tuesday morning at latest.

Saturday, January 30, 1847.

### INDEX FOR 1846.

With the present number of the Journal, our readers will receive the *Index* for last years' volume.

#### Columbus and Erie Railroad.

A friend, dating at Newark, Ohio, writes us as follows: "From the interest you exhibit on the subject of railroads in Ohio, you will doubtless be gratified to learn, that the Board of Directors of the Columbus and Erie railroad have resolved to place the road under contract from Mansfield to Newark as soon as the engineer can prepare and make the proper estimates. If the 'Central Railroad' from Philadelphia to Pittsburg is carried forward, as is anticipated, we confidently expect to be 'put in communication' with Philadelphia, via Pittsburg, by railroad, within five years. A road from Pittsburg, (if that city keeps her interest in view,) towards Columbus will form a junction with the Columbus and lake Erie road at this place unquestionably. Zanesville is already moving in the matter, and will doubtless go forward to Wheeling, unless Pittsburg anticipates her."

In connection with the above, we find the following in the last number of the Ohio State Journal, touching upon the same subject. The editor says:—"The following communication is from a source which entitles it to the highest consideration of our citizens. No man in Ohio commands more fully the confidence and respect of the people of the state, than the writer. We commend his concluding suggestion, to the early and attentive consideration of all concerned:—"

*The Columbus and Lake Erie Railroad Company.* This charter, passed in March, 1845, authorized the construction of a railroad from Columbus to some point upon the Mansfield railroad. An organization was held in February, 1845; last fall, soon after the Mansfield railroad was finished, a survey was commenced, and so far matured, that at the December meeting of the Directors, the line from Mansfield to Frederic was adopted as a part of the route.

At a Director's meeting at Mansfield on the 19th inst., surveys had been extended so much as to lead to a selection of the route to Columbus, by way of Newark. The subscription and resources of the company were such as warranted the Directors to order the line to be prepared for letting, and in a few weeks, as soon as the necessary estimates can be made, the whole distance, from Mansfield to Newark, will be placed under contract. Encouragement has likewise been given, that the road will be made at the same time from Newark to Granville. The Directors find abundant reason to justify the belief, that the whole road from Granville to Mansfield will be finished at an early period.

Thus a railroad will shortly be in operation from the lake to a point within 26 miles of the state house; and if a subscription of \$100,000 can be raised in Franklin county, a locomotive, fed by lake waters, may whistle in the streets of Columbus within two years. But—

Mansfield, January 22, 1847.

#### Iron Trade in England.

By the arrival of the last steamer from Europe, the most cheering accounts are received in relation to the iron business. A very great improvement has taken place in prices, during the past month, and it will be seen by our quotations to day, that this advance promises permanency at least for the present. Wilmer & Smith inform us that the new year has commenced with a decided improvement in the value of iron. Pig iron may be considered as 58s. per ton, and merchant bar iron 10s. per ton higher than the prices in the beginning of December last. This improvement seems likely to be of some continuance, and there seems little doubt that, before the end of the present month, prices will be still higher. It has been ascertained that the stock of pig iron on the 1st January, 1847, is about 100,000 tons less than the quantity held on the 1st of January, 1846, and that the make at present is incapable of any considerable extension, as there is a deficiency of colliers and skilled workmen.

The make of bar iron is reduced in a still greater ratio, in consequence of the continued demand for rails, which has induced many of the iron masters to diminish or extinguish their make of bars, and to turn out a greater quantity of rails; the demand for other descriptions of iron is fair, but not excessive, hence the improvement on these descriptions has not kept pace with that on pig iron and merchant bars. Without reference to a foreign demand for iron, we see in the requirements of Great Britain and Ireland, and the East and West India and Canadian dependencies, full employment for the English ironmasters for some time to come, and should no other counteracting causes intervene, we believe that the prices for 1847 will be above the trade average. The following are the present quotations delivered in Liverpool:—Scotch pig, £4 5s. to £4 7i. 6d.; merchant bar, £9 10s. to £9 15s.; best rolled, 101 15s. to 111; hoop iron, 111 10s.; sheet, 121; I C charcoal tin plates, 32s. per box.

The London Mining Journal of January 2d, in its article upon the iron trade, says "that great activity has prevailed during the past two or three weeks, in the iron trade, in South Staffordshire: many large contracts have been taken, and others as extensive are now under consideration: much is said of the unusual scarcity of ironstone, and very high prices are realized—while coals are a still more difficult article to obtain. Notwithstanding this state of things, a great discrepancy exists as to prices; a large Welsh house has tendered to the South Staffordshire company, to deliver at one of the Grand Junction stations, rails at £10 2s. 6d. per ton; while a Staffordshire house has found it to their interest to violate the rates agreed upon at the previous meeting, and who have supplied rails at £9 18s. 6d., and chairs at £6 18s. 6d. per ton. Some speculation is entertained as to the decision which will be come to at the ensuing quarterly meeting; but it is generally believed that notwithstanding the demand for railway iron, which would justify an advance, the masters will not make any addition to present prices.—Such a proceeding would probably cause strikes among the workmen and miners, unless increased wages were agreed to; and many of the small manufacturers, who have many contracts on hand, and have for months realized but seriously scanty profits, would most probably be ruined. The advance on coals at the pit's mouth is 1s. per ton. Upon the whole, there appears every probability that the price of iron for the next three months will remain firm; and that, notwithstanding the demand is considera-

bly above the supply, every effort will be made to execute present railway orders at existing rates."

Our own private letters, received by this arrival, from an intelligent American, now in England, who has for many years been connected with the railroad interest in this country—and in whose judgment we place reliance—confirm this intelligence. He informs us that he has conversed with a practical man in London, well acquainted with the subject, who assured him but a day or two prior to the steamer's departure, that he would not be willing to contract for the delivery of railroad iron hereafter at £12 5s.

The demand for iron is very brisk, and large orders have been filled at our quotations. In France, a similar activity prevails, and all the indications show that a most flourishing business, at advanced prices, must follow in this business, during the present year. In relation to this subject, we make several extracts from English journals, to-day—to which the reader is referred.

#### Railroadiana.

A public meeting was held at Mobile, Alabama, on the 12th inst., to consider a proposition for connecting that city with the waters of the Mississippi and Ohio by means of a railroad to some point on the Mississippi, below the mouth of the Ohio. Resolutions were passed, declaring it to be the duty and interest of the citizens of Mobile, to join in the struggle for internal improvements in which the older cities of the Atlantic are striving to draw to their storehouses the products and wealth of the great west; and expressing an opinion that the contemplated railroad is both desirable and practicable.—A committee of fifty was appointed to adopt all necessary means to promote the enterprise.

The principal objection, says the Philadelphia U. S. Gazette, to making New Orleans a terminus for a line of trans-atlantic steamers, has been the bar at the mouth of the Mississippi. But for this it would long ago have had a line of steamers plying between there and England. A fine harbor has been discovered on the Gulf, and from this place, known as Cat Island, it is proposed to run a railroad to New Orleans, a distance of 60 miles, which will enable passengers to reach the city quicker and at a cheaper rate, the distance from the bar being 110 miles.—The railroad is now being constructed, and there is every probability that Cat Island will be made a terminus for the British West India steamships.

The people in the northern section of New York are taking active measures to fill up the subscription to the stock of the Rome and Cape Vincent road.—Thus far, \$425,000 have been subscribed. The charter provides subscription for the road to be made by separate sections—the first extending from Cape Vincent, on the river St. Lawrence, to Watertown; the second from Watertown to Salmon river; the third from Salmon river to Rome. As soon as the stock is taken for the first and second sections (750,000) the company may be organized by the choice of a board of directors, authorized to go on with the works.

The Boston Traveller states that the following resolutions were passed at the annual meeting of the Fitchburg Railroad Corporation, at the Tremont Temple, on Monday:

*Whereas*, The interests of this corporation will be greatly promoted by a connection with the Vermont Central railroad; and *whereas*, agreeably to an arrangement between the two corporations, the said Vermont Central railroad company have acted in good faith, by commencing the construction of their road at Windsor, so as to insure the said junction, therefore

*Resolved*, That it is incumbent on the corpora-

tion, both as a company and as individuals, to act in good faith in carrying out said arrangement.

*Resolved*, further, that the Sullivan railroad, designed to connect the Cheshire with the Vermont Central road, has our confidence, and is worthy of the aid of the community, and particularly of the stockholders of this corporation, and that we will do, as individuals, what we can, by subscription to its stock, to insure an object so necessary to our interest.

The inhabitants of Rock Island have held a meeting, at which it was agreed to apply for a charter to build a railroad from Rock Island to the southern terminus of the Illinois and Michigan canal. The distance is 90 miles, and the face of the country, over which it is proposed to carry the road, is highly favorable.

The Bangor Democrat makes the following remarks on the subject of the Maine railroads: "The railroad fever in the central part of the state and farther west has not abated. The question whether there is to be one or two roads remains undecided. Both routes are the shortest and the best according to the most respectable authority, and both most deserve the favor of the public. The people in this part of the state do not of course care whether the railroad east from Portland runs on the lower or upper route to the right point on the Kennebec for striking across to Penobscot. But it would be a pity to have two parallel roads near each other, as neither could then be profitable, and it may be that if the friends of each do not unite both may be defeated for the present. We therefore hope there will be a union of interests, as the best thing for all concerned. It strikes us at present, that the people of the eastern part of the state will not consult their true interest by being partisans of the 'broad gauge,' as the narrow will answer all our purposes, and is, therefore, the best for us as it will be the least expensive. The broad gauge road may be the best for very heavy transportation, but the narrow will be all that is required between the two rivers, and uniformity is very desirable."

The Boston Courier—naturally "very cool" upon all topics of public interest, alluding to the subject of the railroads "down east," says—"The lower Kennebec country is in a blaze of excitement with regard to the railroad from Augusta to Boston, with a branch to Bath. Mass meetings have been held in most of the towns upon the route, which have been swelled by large delegations from other towns, interested in the project, and a degree of enthusiasm has been manifested, as detailed in the Kennebec journals, which shows that nearly the whole population is enlisted in the enterprise, and that the work must and will be accomplished. The first assessments were apportioned as follows—Bath, \$150,000; Augusta, 100,000; Gardiner and Pittston, 100,000; Brunswick and Topsham, 60,000; Hallowell, 50,000; Bowdoinham, 20,000; Richmond, 10,000; Freeport 10,000; and all agreed to go to work and fill up the list. It has since been found that Augusta is good for at least 125,000. The subscriptions in Gardiner considerably exceed their quota of 100,000; Bath has 125,000, and will go up to 150,000, if not 200,000 yet; while Brunswick and the other towns on the line will soon fetch up and exceed theirs.

"Thus far have the subscriptions progressed. A road passing through such a country, and having such a community to back it, can have but little chance of failure. The Augusta Journal states, as from authority, that a Boston engineer has been employed to superintend the construction of the road who will enter upon his duties forthwith; that they are warranted in saying that the road is now begun, that proposals for grading the whole line will be ad-

vertised in season to break ground as soon as the snow is off."

A company of engineers are now employed in surveying the southern portion of the Hampshire and Franklin railroad, on that portion of the road lying between Hockanum and Willimansett, a distance of seven miles. Individual land boundaries have also been taken on the line between Hockanum and Grout's in Montague.

For the American Railroad Journal.

Newcastle, (Del.), January 4, 1847.

'There was a communication in one of the November numbers of the Journal—which, having been mislaid, has just come under my notice—signed E. H. Derby, on the subject of Mr. Whitney's Oregon railroad; and as I differ somewhat from Mr. Derby's views on that subject, I trust that gentleman will not take it amiss, if, in the kindest spirit in the world, I point out wherein I differ, and my reasons for so doing.

Mr. D. starts by mentioning the vastness of the undertaking, and the interest that has already been awakened to it in the public mind in every part of the country, which is very true, and is a striking instance of the effect of patient and continued perseverance directed to one great object—of which few persons have evinced more than Mr. Whitney, or with, at the outstart, a poorer prospect, perhaps, of success. When, about two years since, in a personal interview with Mr. Whitney at his rooms, where books, maps, charts, etc., bearing on the subject, were freely scattered on all sides, to whose examination, comparison and digestion he was devoting the energies of his mind, I received from himself a development of his great plan—which I considered so feasible, that I intended to accompany him in his explorations of the country to the Missouri river, which he then had in view, and afterwards accomplished, but I was prevented by circumstances. It was, I confess, with some misgivings that I opened the subject to my friends and acquaintances, lest the smile of incredulity, which it often met with, should be my only reward. I mention this to show the change that has taken place in public sentiment on this subject in the brief space of two years—the result of Mr. Whitney's single-handed efforts.

Mr. D. then proceeds with his first objection to Mr. Whitney's plan, viz: the great length of the work—say 3000 miles from one seaboard to the other—and the consequent heavy charges to which merchandize will be subjected in passing over it. This your correspondent puts at \$45 per ton, or at the rate of \$1 50 per ton per 100 miles, or the lowest rates at which merchandize is transported on the railroads of the country. While I admit this latter position, I consider \$45 per ton too high, for several reasons. In the first place, merchandize starting from New York, for instance, would pass by the present improvements to Lake Erie, and then availing itself of the navigation of the lakes, reach the commencement of the Oregon railroad, considerably less than at the rate of \$1 50 per ton per 100 miles. The English trade would probably pass up the St. Lawrence to Lake Ontario, and thence availing itself of the increased facilities lately afforded by the enlargement of the Welland canal, up the lakes to "Whitney"—for such I would suggest as the name of the starting point of the Oregon railroad—also at a less cost than the rate before spoken of. In short, instead of merchandize being subjected to railroad charges for the distance of 3000 miles, 22 or 2300 would be the extent, (unless in winter)

and the "flowing sheet, and glancing keel," to which your correspondent poetically alludes, would do much of the rest.

I think I have already shown that the charges may be reduced from \$3 to \$5 per ton on this portion of the route. Now let us see if it will not fairly admit of further reduction on other portions. This is a work that, singularly enough, will cost no man a dollar; no man will be able to say that it has taken one cent from his pocket. Nature has kindly furnished the capital—she will be the great shareholder; and she will require no dividend beyond the increased welfare and enjoyment of the creatures she has placed here to be the recipients of her bounties. The vast outspread and unoccupied prairies and the tangled and untrodden forests, are the capital. This is an answer to Mr. D.'s third objection—the great absorption of the wealth of the country. The wealth that is to build the railroad lies hidden in the soil, and the plough of the emigrants which the railroad shall invite to these regions, shall turn it up, and render it available.

As to Uncle Sam—there never was an uncle before that had so much money to throw away in a quarrel, and so little for any purpose that equits toward usefulness. If dame Nature has ever signed, sealed and delivered any title papers by which he claims these regions, he will doubtless rejoice at such a disposition of them; as at the present he appears much inclined, by such devices as land graduation, preemption, etc., to shake himself clear of as much of his landed estate as possible.

By these remarks I mean, that whereas a profitable investment of capital with reference to cash dividends is always the first point considered in ordinary enterprises. This would look to no such result. It is a great national affair, whose dividends will be rich in public good—in business relations and good-fellowship with the most unfrequented parts of the world, and in an iron bond of brotherhood reaching from Maine to Oregon. We might as well require of the navy to pay six per cent. interest, or the "small fort" below your city to declare semi-annual dividends, as to make that a condition on which should depend the construction of the Oregon railroad.

If, then, we leave this condition out of sight, and I appeal to Mr. D. whether we may not—if indeed his calculations contemplated such a result—a tax upon the business of the road barely sufficient to work it, and keep it in repair, is all that is required. And as the ordinary expense of maintaining and working railroads, may, it is believed, be assumed at 50 per cent. of the gross income—the other moiety being consumed in the shape of returns upon the capital employed—it follows that the Oregon railroad could transport both goods and passengers at one-half the cost of other railroads. But as the passenger business would bear to be taxed at the ordinary rate of, say, three cents per mile (if necessary) the charges for freight could be still further reduced, if desirable.

If we call the cost of the road, agreeable to your correspondent's estimate, and I think he is not far from the mark for a road of first rate capacity, \$30,000 per mile—this, at 2,400 miles, the distance by Mr. Whitney's calculations, gives \$720,000,000. This is to be understood as including equipments—all complete. If, then, the cost of working and repairs amount to \$4,320,000 per annum—or 50 per cent. of a sum that would pay six per cent. interest, a very ample allowance—let us see what amount of business is necessary, and at what rates, to obtain this sum. Well, 50,000 passengers, at, we will say,

two cents per mile, or say \$50 each, gives \$2,500,000; and 75,833 tons of freight, at, we will say, to be safe, \$1 per ton, per 100 miles, or \$34 per ton, equals \$1,820,000; and altogether the above sum of \$1,320,000—an extravagant sum, as it would appear, for the purpose. This is a number of passengers, and an amount of tonnage, equalled by perhaps half of the railroads of the country, and evidently far below the mark. I give these statements to show what a comparatively small amount of business the road could live on.

But I think your correspondent's estimates might be still further reduced, viz: the cost of shipment from China—the trade with China not being alone of importance, however, but also that, as Mr. Whitney tells us, "of Mexico, South America, (western coast,) with all the islands in the Pacific, with China, with Japan, with Manilla, with Australia, with Java, and with all India"—to the mouth of the Columbia. Mr. D. call it \$15 per ton, still rather high, I think. The distance between these points is about 6,000 miles, and to China, by Cape Horn, nearly 18,000. Now if \$30 a ton is the price of freight from New York to China by sea, we cannot fairly put the freight to Oregon from China, over a calm, smooth ocean, like the Pacific—of which a scientific gentleman attached to one of our national vessels says, that he never saw upon its surface a wave of more than 20 feet in height—especially if we include the difference in the rate of insurance—at more than one-third of the former. However, we will use Mr. D.'s figures for this item.

We have, then, \$15 to Oregon, \$24 to the lakes, and for the remainder, lake and canal carriage—about 600 miles—I shall say \$6, and altogether \$35, or but \$5 more than by sea, besides a saving in insurance, and interest on capital employed; but I shall make a more distinct reference to these items hereafter.

I have heretofore spoken of the trade between this country and the East—or rather "West," as these countries will get to be when the Oregon railroad is completed—but I shall now speak of the trade of England and Europe in connection with this channel. And with reference to this trade I will admit all that Mr. D. assumes as to charges, with the exception of that from the lakes to the Atlantic; on which account I deduct \$3 per ton. Of course it is not to be expected that we shall build railroads for the accommodation of strangers, without a *quid pro quo*—therefore the allowance of \$1 50 per ton per 100 miles, from Oregon to the lakes, is correct, I think, as applied to this trade. We have then \$57 from China to the Atlantic coast and \$6 thence to Liverpool, by sailing vessels, gives \$63 per ton, in this comparative scale of charges.

The time occupied in sending out goods, or specie, to China, and getting a return, is not less than 12 months. Now if every ton of goods that is sent to or returned from China, is worth \$500, that is to say, if every pound is worth 25 cents, and I think on examination this will be found low enough, as take the principal articles shipped from this country, specie, domestic cottons, (the principal) ginseng, furs, manufactured tobacco, spermaceti candles, etc., (\$175,000 worth of lead being the principal exception;) and those returned, silks, teas, linens, spices, drugs, china and porcelain wares, die stuffs, etc.; then the interest on the capital invested in a ton of merchandize will amount, while making the voyage, to \$30, and the insurance at two per cent.—I have some idea that this is about the rate, though I may be wrong—amounts, out and back, to \$10, to which add \$30, the interest on capital, and \$30 for freight,

and we have \$70 as the charges on a ton of merchandize by the "glancing keel." The rate of interest in England is not so high as I have placed it; but what merchant expects, even there, to make less?

Add to \$63 the freight charges by the Oregon route, four months' interest, or \$10, and one-half the former amount of insurance, or \$5, and we have \$78 as the charges by the Oregon route per ton; or but an excess of \$8. It will not be difficult to see sufficient advantages to result from the latter route to more than counterbalance this, which is equal to but 14 per cent. upon the capital; and the charge of \$78 per ton, but 6 per cent. Compare this with the percentage of freights at present on the heavy articles which compose so much of the commerce between this country, England and Europe, viz: flour \$1 50 per barrel, or 30 per cent.; 35 to 40 cents per bushel for grain, or 33 per cent. on wheat, and 50 per cent. on corn. One advantage alone that would far more than counterbalance the above extra charge of \$8 per ton, would be the certainty with which goods might be looked for at a given time; thus removing the great uncertainty attending that trade, from the fluctuations in the market between the conception of an enterprise, and its completion. A merchant can tell to-day what an article is worth, and can form some conception of what it will be worth three or four months hence; but as the distance in time recedes, the uncertainty increases in a geometrical ratio. It is this that secures to the ocean steamers their freights—together, of course, with the high price of the goods so sent, and the consequent small per cent. upon the cost, after all, of the high charges to which they are subjected.

On looking at the reports on the subject of the commerce and navigation of the country, it will be seen that those articles which compose the bulk of trade between us and the East, are, mainly, those high priced articles which Mr. Derby admits will bear a high rate of transport, some of which I have named above; and it will further appear, a fact that has just met my eye, that I am borne out in assuming the value of each ton of merchandize which passes between the two countries at \$500. In the year 1843, the total of imports from China amounted to \$4,934,000, and it was transported by about 12,000 tons of shipping; which is equal to \$411 per ton value. If we allow for the large amount of stores, etc., carried on these long voyages, it will be seen that I am nearly right. The commerce of China, Asia generally, and the Sandwich Islands, amounts to about 16,000 tons per annum, or 32,000 both ways. This will show what the Oregon railroad can do towards the commerce of Europe, after accommodating our own.

Having already alluded to M. D.'s third objection, I shall offer one or two remarks on his second, and close this article; which has already spun out beyond the limits I had assigned it. This objection is the immense tract of wilderness through which it would pass, affording no remunerating local traffic for many years. This is not a new state of facts as applied to railroads—except the distance—where even a profitable investment is looked to; as take the Vicksburg and Jackson railroad, spoken of by the writer in the Edinburgh Review, as transferred to your columns. This work is about to be extended 200 miles. The immense wilderness spoken of, presents in fact the very strongest argument in its favor. It is the facilities which the railroads alone can afford, that will enable our hardy pioneers to enter upon and subdue it with despatch—and whether or not a remunerating local traffic should soon spring up, would be of little importance, so that it finally

peopled their remote regions; if the through traffic should be sufficient for its maintenance, as it in all probability would.

Still your correspondent's suggestion is doubtless worthy of consideration; and the route he proposes, it cannot be denied, has its advantages. But as we want this railroad for our own purposes—to promote and facilitate intercourse and good feeling among ourselves—to enable us to convert the untrodden wastes to our uses—after all it will appear that Mr. Whitney's plan is the true one.

I trust, Mr. Editor, I have given your correspondent no cause of offence in my objections to his objections. I certainly have endeavored to avoid so doing, as between us of the profession there should be nothing but harmony. But holding an honest difference of opinion, I have expressed it, I hope courteously. Yours very truly. F. P. HOLCOMB.

#### Americans in Russia.

The following extract of a letter from a Philadelphia engineer, now in Russia, and who is a machinist of ability and repute, is going the rounds of the press, from the Philadelphia Enquirer, and we give place to it as containing matters interesting to our readers. It is dated Herald Mechanical Works, Alexanderoffsky, Russia, Nov. 4.

"In the beginning of our operation here, we had very much to do, in organizing this mammoth establishment. We found it greatly in decay and confusion; so much so, that we abandoned all the old tools, and fitted up the establishment anew. We were looked upon by many as wild adventurers, and that we had undertaken to do a vast deal more work than it was possible to do in the time allotted; but at the expiration of our second year, they became convinced, 'that some things could be done as well as others,' and the present it is only requisite for us to say a thing can be done, and all hands knock under. We shall finish this year or the beginning of the next the full complement of trucks, (5300,) and in all of next year, (1847) the 162 locomotives will be finished. We are now driving on with such speed, that we feel no hesitation in duplicating our first orders in 1850. We have limited the number of engines to be out six a month to prevent running out of materials. We have turned out nine a month, and the number for the last six months is 65. In our car shops we are getting on very finely; we have delivered to the government 900 platform cars, and 300 box cars, and are now finishing five box cars every day—they are large, eight wheel cars, 30 feet long. We have not yet commenced on the passenger cars, but have completed the building of a shop for that purpose. The building is 375 feet long by 60 wide, and divided into three apartments, the first for preparing the work, the second for erecting, the third for painting. The number of cars that we have to make is 2000 box, 580 platform, and 70 passenger cars—making the complement for the 5,300 trucks in the first order. Independently of these, we have taken an order for two imperial cars, 70 feet long, to be placed on 16 wheels. We are to receive for these cars, 11,600 rubles of silver each, or \$8,625, without chairs, sofas, or inside trimming. We have undertaken, and now have nearly completed, about 20 miles of the railroad. This we undertook more for our accommodation than profit, so as to have a portion of the road to operate upon.—We have declined making the rest of the road, as it would interfere with our present business.

"We do considerable transient work, and could have much more if we chose to take it. We are now making 7 stationary engines for the interior, and have in hand several heavy orders for bolts and nuts for bridges on the line. This has been a very busy year for me, and our imports have been very heavy, amounting to over half a million of dollars. The number of vessels we have received this year is 85, and there are several more yet to arrive. We have had at times this summer, nearly 3000 men employed, which, together with the foreign business has giving the mercantile department much to do, and to prevent errors occurring, I have been constantly on the alert. All the business with the government has to be transacted by writing."

**The City of Lowell.**

In a recent letter, published in the Boston papers, Mr. Nathan Appleton, of that city, gives the annexed interesting particulars, touching the first undertaking of the now populous and flourishing city of Lowell, Mass. He says:

"As connected with the matter, and as constituting the germ of the present city of Lowell, the following circumstances may be thought interesting. Mr. Patrick T. Jackson and myself had been amongst the original associates who established the Boston Manufacturing company of Waltham, in which the power loom was first brought into successful operation on this side of the Atlantic. The success of that establishment had satisfied us that the time had arrived for undertaking the manufacture and printing of calicoes, and in the summer of 1821 we made an excursion into New Hampshire, in search of a suitable water power.

"Soon after our return, the idea was suggested to Mr. Jackson of purchasing the stock of the Pawtucket canal on the Merrimack river, together with such lands as might be necessary for using the great water power which might be created by its enlargement. He communicated the same to me. After ascertaining that Mr. Kirk Boott was willing to join us in the enterprise, and become the manager and agent to carry it into effect, we proceeded, through trustworthy agents, to purchase the canal, and the most important adjoining lands. It was not until these had been secured, that we thought proper to visit the scene. I well recollect the first visit. It was in the month of November, 1821, and a slight snow covered the ground. The party consisted of Mr. P. T. Jackson, Kirk Boott and myself. We perambulated the ground and scanned the capabilities, and it may be worth recording that so sensible were we of its future importance, that I distinctly recollect one remark made by one of the party, that some of us might probably live to see the place contain 20,000 inhabitants. We proceeded with new associates, to organize the Merrimack Manufacturing Company, with a capital of 600,000 dollars, to which corporation the whole property was conveyed. The enlargement of the canal was finished during the two following summers, and on or about the 1st day of September, 1823, the first water wheel performed its evolutions. The city now contains, I am told, upwards of 30,000 inhabitants.

"I certainly look back with satisfaction upon the part which I have had in leading to this result. I do not say this with any reference to pecuniary interest. I could not say it, did I not conscientiously believe that the introduction of the cotton manufacture has added greatly to the mass of human happiness in those immediately concerned in it, as well as to the aggregate wealth and prosperity of the whole country. I could not say it, did I perceive in the system any tendency toward a relaxation of the moral purity which has ever been a characteristic of our beloved New England. My mind was early turned to a consideration of this ques-

tion. I could never perceive any just ground for the opinion which formerly prevailed extensively, that occupation in manufactures was less favorable to morals than other manual labor. This opinion has, I believe, universally given way before the light of experience. 'Tis the elevation of all labor above the right of a mere subsistence, which gives it character and standing in society, and constitutes the elementary differences between American and European labor. That this elevated position may be strengthened and perpetuated by our institutions, is my ardent wish."

**Kennebec and Portland Railroad.**

The Boston Daily Advertiser—one of the soundest business papers in the country—publishes the following able article on this railroad, with the annexed preparatory remarks:—"We are glad to learn that the enterprise bids fair to be undertaken with energy, and to be prosecuted to a speedy completion. We agree with the writer in the belief that this road promises to be among the most successful works of this nature, for which the country affords an opportunity. It will enjoy the double advantage of passing through a tract of country of large population, collected in large and flourishing villages, and engaged in commercial and manufacturing pursuits, and also of forming a thoroughfare for the travel of a large population residing beyond its two termini. It will form the line of direct connection between the commercial and political capitals of the state—and it will at the same time connect with both of them, as well as with this city, the large towns of North Yarmouth, Freeport, Brunswick, Bath and Gardiner, and it will form a part of the route from Boston and Portland, towards the whole eastern portion of Maine, both by the sea coast route, by way of Wiscasset and Bath, and by the inland route, by way of Augusta and Hallowell."

We understand that at a meeting of the Directors of the Kennebec and Portland railroad last week, in this city, it was determined to put the whole line to Augusta, with the branch to Bath, under contract as soon as the state of the surveys and the season would admit. The subscription to the stock has been largely increased upon the line of the road, within the last ten days, and with the former subscriptions, it warrants the Directors in proceeding with the work as fast as is practicable to do so. It is believed that the road to Augusta can be completed in less than two years; and the expectation is entertained, that by an arrangement with the Directors of the Atlantic and St. Lawrence road to run upon that to North Yarmouth, the road to Brunswick, if not to Bath, may be opened for travel within one year.

This road, when completed, will form an important link in the great chain of railroads leading to this city. The people of the state of Maine are intimately connected with us in all their business relations, and we have a strong interest in the success of an enterprise that will afford facilities for improving and extending this connection. The proposed road runs through and connects all the large towns in Maine on the west side of the Kennebec river, and is in the direct line to all of the principal towns east of that river. The number of inhabitants in the towns through

which the road passes, is as great as on the line of any road of the same length in New England; and in all of the towns the people are engaged in commerce and manufactures, and intimately connected with each other in their social and business relations. This will secure to the road a large local travel, which is found to be the most sure source of profit to railroads. Some opinion can be formed of the travel and transportation that would pass over this road to this city, from the throng of passengers that have crowded the Kennebec boats for the last two or three seasons.

It has been objected to this road that it will have to compete with the boats for a large portion of the year, and thus reduce the amount of its profits. So far as the public is concerned, the only effect this competition will have, will be to insure a low rate of fare, and so far as the stockholders in the road are interested, low fares will yield as much as high fares, where the population is dense and there is an extensive region from which the travel can be drawn. More than three-fourths of the whole population of Maine are within forty miles of the sea coast; and the obvious policy of securing the greatest advantage to a railroad, is to run it through the large towns near the coast, till it strikes the Kennebec river, the centre of the population of the state, and then run up that river to some point where a road would strike off to the east.—This is what this road proposes; and it is confidently believed by the subscribers to the stock in Maine, and by the Directors, that it will be one of the most profitable roads connecting with this city. Some of our large capitalists have subscribed liberally to the stock, and we hope that others, and the business men of the city, who are more immediately interested in this enterprise, will not withhold from it their support.

**English Items.**

**The "Great Britain."**—It appears, says the Mining Journal, that the statement which appeared in our Journal of last Saturday, announcing the abandonment by the directors of all intentions of saving this ill-fated steamer, was incorrect. By a report from Mr. Brunel, (the company's engineer) on her present state, just published, we learn, that "except the parts actually damaged, the extent of which is comparatively small, the ship is perfectly sound, and as good as the hour when she struck. The principal injury is in her bottom, under the boilers and engines. The vessel has been evidently thumping on the rocks, and almost entirely upon this part of the bottom, from the first few days after she grounded—and at present, in all probability, her whole weight is resting on this part; yet, notwithstanding this, she is perfectly straight, and has not broken or even sprung an inch in the whole length. The boilers have been forced up about 15 inches, and one of the condensers has been lifted up about 8 inches, breaking the air-pump. At present, this is nearly the extent of damage done—all of which could easily be repaired if the vessel were in dock." Mr. Brunel considers that there is no doubt that to get the vessel off is better policy than to break her

up where she is, and that the main object is to protect her from the sea.

**The Salt Trade of France.**—We understand, that in consequence of petitions from several large firms, embarked in the Newfoundland fishery, to be allowed to employ, in 1847, the salt of Spain and Portugal, (which the captains could take in on their passage) for the curing of fish, instead of being restricted to that of France—the Minister of Finance has consented, that all vessels now equipping for the Newfoundland fishery, may lay in salt from those countries. This is a great concession on the part of the French Government, itself the chief monopoliser of the salt trade; and it is hoped will lead ultimately to a reduction in the import duties on British and other salt, at present next to prohibited entering France.

**"Gun Tow" applied to Blasting.**—A gentleman, who has been a manufacturer of gunpowder, in the west of Scotland, for the last 20 years, has been successful in several experiments with gun tow and gun sawdust, for blasting purposes. A perfectly satisfactory trial was made, on Tuesday last, (through the politeness of Mr. McCallum, at the Lady Mill Quarry, in the presence of Professor Penny, and a number of other scientific gentlemen. One of the experiments was with a bore of 3 ft. 4 in., and  $2\frac{1}{2}$  diameter, charged with 11 ozs. tow and cotton, mixed, (4 lbs. gunpowder would be required) and which brought down about 13 or 15 tons in weight—the effect is represented as "splendid."

**New Locomotive.**—Mr. Galloway, it is stated, is now trying an experiment on the Great Western Railway, at Maidenhead, up an incline of 1 in 19, from the road below to the station above, with a new species of locomotive. The principle is to do away with the driving wheels altogether, and to connect two horizontal wheels, instead of the driving wheels, with the pistons. These wheels run before, and press the opposite sides of a rail between the other rails by means of leverage gear; and, from their bite on that rail, they produce the traction of the train in lieu of the driving wheels. It is said, that an engine of this kind has drawn 30 tons readily up the incline mentioned.

**Antimony Mine in Scotland.**—It was announced, some time ago, that a rich mine of antimony had been discovered on the estate of the Marquis of Bute, in the parish of Cumnock. It has now been wrought for some time, and is giving employment to about a dozen hands, and is in every way likely to turn out profitable to the noble proprietor. The difficulty of access to it—the mine being situated on the top of an eminence called Harehill—is attended with considerable expense.—*Kilmarnock Journal*.

**New Locomotive.**—On Monday, one of the largest locomotives ever constructed for the narrow gauge, was taken from the foundry of Messrs. Bury, Curtis and Kennedy, to the railway station in Crown street. It was drawn by 17 horses, and seemed to attract much attention. The engine has six wheels,

coupled, the diameter being about 5 ft. We learn that several locomotives are in course of construction at this factory, which will have wheels of 6 ft. diameter, and a larger stroke of piston than usual, by which the speed will be much increased.—*Gore's Liverpool Advertiser*.

**The Tin Trade.**—Although the price of iron is good, and an advance daily expected, yet the tin trade is in a somewhat depressed state. Where formerly 1200 boxes were made in a week, now scarcely 800 are completed; consequently, the operatives work but two thirds of their time. Various reasons are assigned for the deficiency in general orders; but, as we are not conversant with the right one, we cannot offer an opinion.—*Monmouthshire Merlin*.

**Cymbrain Boiler Plate Company.**—We hear that this company, whose works we noticed favorably in a recent number, have already received extensive orders for plates; and, amongst others, from Messrs. Fairbairn and Sons, of Will Mall, London, iron shipbuilders of first rate eminence. Mr. W. Fairbairn is, we believe, the gentleman whose experiments, in relation to the tubular bridge over the Menai have excited so much attention lately in the engineering world.—*Monmouthshire Merlin*.

**Coal in Nova Scotia.**—The General Mining Association are about to open a new coal mine in Cumberland county. This establishment will supply New Brunswick, and the Nova Scotian ports in the bay of Fundy, and will shorten the distance for the coal vessels from the United States. The coal is said to be of excellent quality.

**Irish Railways.**—The Board of Works has given its sanction to the full amount of the presentation, for £16,000, to the Waterford and Limerick Railway at Cahir sessions, and West Ifla and Offa barony will be enabled to afford employment to every man therein in want of it.

**French Railways.**—The Minister of Public Works, has just nominated a commission to report on the experiments commenced on the Sceaux Railway, constructed after a system of curves of small radius and worked by articulated carriages. The commission is also to report on the proceedings of the atmospheric railway established from Nanterre to St. Germain.

#### Maine Railroads.

A writer in the Boston Courier, who seems to be acquainted with the railroad interest in New England, gives the annexed particulars in relation to the roads, in Massachusetts, New Hampshire, and Maine, which will prove interesting at this time.—The railroad "fever" is at a high pitch in the eastern country, and the people in that section, are very busy just now with the subject. The Courier's correspondent says:—

Since Maine has been re-annexed to Massachusetts by the iron bonds of the Eastern and Maine railroads, the citizens of Massachusetts, and of Boston in particular, are interested in the extension of these railroads, in the state of Maine. I would, therefore, ask for so much space in your columns as may

be necessary briefly to inform your readers of the several railroads projected in Maine.

The Portland, Saco and Portsmouth railroad, uniting at South Berwick with the Maine, and at Portsmouth with the Eastern railroad, is the only road now extending from Portland, west. A charter, however, was granted at the last session of our Legislature, for a railroad from Great Falls, at the New Hampshire line, through Alfred, Buxton, and Gorham, to Portland, which, if constructed, will make two separate roads from Boston to Portland, although the way business on part of this new route would be considerable, yet it would seem almost a waste of capital to build both roads, when as the public suppose, a little mutual concession on the part of the present Directors of the upper and lower routes, one road, from Berwick, might accommodate all parties. If the contemplated upper route is built, it must materially affect the stock of the Portland, Saco and Portsmouth, and also of the Eastern railroad.—The upper route would avoid the long bridges and the ferry on the lower route. A survey of this upper route has lately been made, at the expense of the Maine railroad corporation; but it is doubtful if the road can be built at present, without the aid of the Maine railroad.

East of Portland, the Atlantic and St. Lawrence railroad, connecting Portland with Montreal, Canada, has been located and let to contractors as far as Danville, a distance of 30 miles. About 15 miles is already graded, and as the work on the remainder is progressing this winter, the road will be ready for the rails early in the summer, and the cars run as far as Danville before next winter.

Additional sections will be put under contract in the spring, and this road will steadily progress until it meets the Canadian part of the work at the line. They have about the same number of miles under contract on the Canadian side, extending eastwardly from Montreal.

This road will form one of those connecting links between the Atlantic and the great west, which Washington's comprehensive glance was, we believe, the first to suggest.

In conversing with a western gentleman, well acquainted with the business of this fruitful section of the Union, which Portland, Boston, New York, Philadelphia and Baltimore are all striving for, he remarked that there was no cause for any jealousy between these respective cities in relation to this trade, for that by the time they had completed their various channels of communication, the products of the "mighty west" would be so increased, that all would find as much business as their respective lines could accommodate.

**Rotary Steam Engine.**—Mr. A. Buffum, a member of the "National Association of Inventors," of this city, has made a discovery in rotary engines which he thinks will take the lead of all others. Mr. B's plan has the merit of simplicity, and looks as plausible as any plan for a rotary can. He expects to be able to furnish a ten horse power engine for \$50, and one that will not occupy more than two square feet of room.—*Eureka*.

**New Grist Mill.**—We have been shown, says the Eureka, the model of a mill, invented by Asa Barber, of Stephentown, Rensselaer county, N. Y., and now the subject of a pending patent. It acts upon features truly novel. The grinding is effected by first cracking the grain, when it is passed to another chamber, where it is reduced still more. It may then, if not sufficiently fine, be returned to the crushing apparatus as often as it shall be required so to do, to produce good flour. The machinery consists of a peculiar fluted cylinder which operates upon a concave bed of furrows or grooves. Mr. B., who is a member of the "National Association of Inventors," promises that we shall fully describe his mill, with engravings, at a subsequent time.

**Computing Machine.**—We have seen a machine for computing figures by any of the rules of addition, subtraction, multiplication or division. It operates in the most simple manner, and is equally simple in its construction. This is the invention of a Pole, by the name of Slonimski, who received very large presents from the emperor of Russia, for his invention. We can say of our own knowledge that this is an excellent machine, and can do any sum in those rules with great speed and accuracy. Mr. S. has assigned his claim to a patent right in the United States, to Mr. S. J. Neustadt, of this city who is applying for, and will probably obtain the same. The machines may be made and sold for from \$3 to \$10 each.—*Eureka.*

**RAILWAY IRON.—THE BEST QUALITY** of English Heavy H Rails—60 lbs. to the yard—now in store, landing from the vessel, and on ship board to arrive, for sale on most favorable terms by  
DAVIS, BROOKS & CO.,  
Jan. 2. [11f] 68 Broad St., New York.

**BACK VOLUMES OF THE RAILROAD JOURNAL** for sale at the office, No. 105 Chestnut street.

**RAY'S EQUALIZING RAILWAY TRUCK.—THE SUBSCRIBER** having recently formed a business connection in the City of New

York, expressly for the manufacture of the newly patented and highly approved Railroad Truck of Mr. Fowler M. Ray, is ready to receive orders for building the same, from Railroad Companies and Car Builders in the United States, and elsewhere.

The above Truck has now been in use from one to two years on several roads a sufficient length of time to test its durability, and other good qualities, and to satisfy those who have used it, as may be seen by reference to the certificates which follow this notice.

There have been several improvements lately introduced upon the Truck, such as additional springs in the bolster of passenger cars, making them delightful riding cars—adapting it to tenders, trucks forward of the locomotive, and freight cars, which, with its original good qualities, make it in all respects the most desirable truck now offered to the public.

Orders for the above, will, for the present, be executed at the New York Screw Mill, corner 33d street and 3d avenue, (late P. Cooper's rolling mills) and at the Steam Engine Shop of T. F. Secor & Co., foot of 9th street, East

**LOCOMOTIVE AND CAR AXLES.**  
The Subscribers are now prepared to receive orders for the well known and approved Reading Locomotive and Car Axles—drawn to any required pattern from Bloom Iron only. Address  
SAML KIMBER & CO.,  
Willow Street Wharf,  
Philadelphia, Pa.  
41f

**NOTICE TO RAILROAD CONTRACTORS.**  
PROPOSALS will be received at the Office of the Boston and Maine Railroad, No. 60 State street, Boston, until Monday, the 8th day of February next, for the Graduation and Masonry on the line of Road in Andover, between the Merrimack River and a point of intersection with the old Road.  
For examination of profile and work, application may be made at the office of the Engineers, at the Depot in South Andover.

THOMAS WEST, President  
Boston and Maine Railroad.  
January 22, 1847. 31d

**NOTICE TO RAILROAD CONTRACTORS.**  
Proposals will be received by the Subscriber, at the office of the Michigan Central Railroad Company, at Detroit, until the 16th day of February next, for Grading the first thirteen miles of the Extension of the Michigan Central Railroad, from Kalamazoo, westward; said thirteen miles contains about four hundred thousand cubic yards of earth work. Plans and Specifications will be ready for examination at the office of the subscriber after February 1st.

J. W. BROOKS, Supt. & Eng.  
Detroit, January 5, 1847. 51d

**A. & G. RALSTON & CO., NO. 4**  
South Front St., Philadelphia, Pa.  
Have now on hand, for sale, Railroad Iron, viz: 180 tons 2½ x 4 inch Flat Punched Rails, 20 ft. long. 25 " 2½ x 4 " Flange Iron Rails. 75 " 1 x 4 " Flat Punched Bars for Drafts in Mines. A full assortment of Railroad Spikes, Boat and Ship Spikes. They are prepared to execute orders for every description of Railroad Iron and Fixtures. 11f

**RAILROAD IRON.—THE NEW JERSEY** Iron Company, Boonton, N. J., are now preparing to make Railroad Bars, and are ready to take orders or make contracts for Rails, deliverable after the first of December next. Apply to  
FULLER & BROWN, Agent,  
No. 139 Greenwich, corner of Cedar street.  
September 18, 1846. 10d39

**NICOLL'S PATENT SAFETY SWITCH** for Railroad Turnouts. This invention, for some time in successful operation on one of the principal railroads in the country, effectually prevents engines and their trains from running off the track at a switch, left wrong by accident or design.

It acts independently of the main track rails, being laid down, or removed, without cutting or displacing them.

It is never touched by passing trains, except when in use, preventing their running off the track. It is simple in its construction and operation, requiring only two Castings and two Rails; the latter, even if much worn or used, not objectionable.

Working Models of the Safety Switch may be seen at Messrs. Davenport and Bridges, Cambridgeport, Mass., and at the office of the Railroad Journal, New York.

Plans, Specifications, and all information obtained on application to the Subscriber, Inventor, and Patentee  
G. A. NICOLLS,  
ja45 Reading, Pa.

**RAILROAD IRON.—THE SUBSCRIBER'S** New Rail Iron Mill at Phoenixville, Pa., is expected to be ready to go into operation by the 1st of September, and will be capable of turning out 30 to 40 tons of finished Rails per day. They are now prepared to receive orders to that extent, deliverable after the 1st of October next, for heavy rails of any pattern now in use, equal in quality and finish to best imported.

**PIG IRON**—They are also receiving weekly 150 to 200 tons of No. 1 Phoenix Foundry Iron, well adapted for light castings.

REEVES, BUCK & CO.,  
45 North Water St., Philadelphia,  
or by their Agent, ROBT. NICHOLS,  
79 Water St., New York  
29d

**THE SUBSCRIBERS, AGENTS FOR** the sale of  
Codorus,  
Glenoid,  
Spring Mt and  
Valley,  
Pig Iron.

Have now a supply, and respectfully solicit the patronage of persons engaged in the making of Machinery, for which purpose the above makes of Pig Iron are particularly adapted.

They are also sole Agents for Watson's celebrated Fire Bricks and prepared Kaolin or Fire Clay orders for which are promptly supplied.

SAML KIMBER, & CO.,  
59 North Wharves,  
Philadelphia, Pa.  
Jan. 14, 1846. [14f]

river, (of which firm the subscriber was late a partner) under the immediate supervision of Mr. Ray himself.

Several sets of trucks containing the latest improvements have recently been turned out for the New York and Erie railroad, and the New Jersey Transportation company, which may be seen upon said roads.

The patronage of Railroad Companies and Car Builders is respectfully solicited.

New York, May 4, 1846.

W. H. CALKINS, and Others.

To all whom it may concern:—This is to certify that the New Haven, Hartford and Springfield railroad co., have had in use six sets of F. M. Ray's patent trucks for the last 20 months, during which time it appears to me, they have proved to be the best and most economical truck now in use.

[Signed,]

WILLIAM ROE, Supt of Power.

I certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Philadelphia and Reading railroad for some time past, under a passenger car.

For simplicity of construction, economy in cost, lightness of material, and extreme ease of motion, I consider it the best truck we have ever used. Its peculiar make also renders it less liable to be thrown off the track, when passing over any obstruction. We intend using it extensively under the passenger and freight cars of the above road.

Reading, Pa., October 6, 1845.

[Signed,] G. A. NICOLL,

Supt Transportation, etc., Philadelphia and Reading Railroad.

To all whom it may concern:—This is to certify that the N. Jersey Railroad and Transportation company have used Fowler M. Ray's Truck for the last seven months, during which time it has operated to our entire satisfaction. I have no hesitation in saying that it is the simplest and most economical truck now in use.

[Signed,] T. L. SMITH,

Jersey City, November 4, 1845.

N. Jersey Railroad and Transp. Co.

This is to certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Long Island railroad for the last year, under a freight car. For simplicity of construction, economy in cost, lightness of material and ease of motion, I consider it equal to any truck we have in use.

Long Island Railroad Depot,

[Signed,] JOHN LEACH,

Jamaica November 12, 1845. }

1719

Supt Motive Power.

**RICH & CO'S IMPROVED PATENT SALAMANDER SAFES.**

Warranted free from dampness, as well as fire and thief proof.

Particular attention is invited to the following certificates, which speak for themselves:

**TEST No. 10.**

*Certificate from Mr. Silas C. Field, of Vicksburg, Mississippi.*

On the morning of the 14th ult., the store owned and occupied by me in this city, was, with its contents, entirely consumed by fire. My stock of goods consisted of oil, rosin, lard, pork, sugar, molasses, liquors, and other articles of a combustible nature, in the midst of which was one of Rich's Improved Patent Salamander Safes, which I purchased last October of Mr. Isaac Bridge, New Orleans, and which contained my books and papers. This safe was red hot, and did not cool sufficiently to be opened until 16 hours after it was taken from the ruins. At the expiration of that time it was unlocked, when its contents proved to be entirely uninjured, and not even discolored. I deem this test sufficient to show that the high reputation enjoyed by Rich's Safes is well merited.

S. C. FIELD.

**TEST No. 11.—Certificate.**

By the fire which occurred in this village on the 27th July last, our Law Office, together with many other buildings, was destroyed—we had in our office one of Rich's Improved Patent Salamander Safes, which, though heated red hot, preserved, without being the least damaged, many papers valuable to our clients—the envelopes of a few papers being slightly scorched. Some twenty-four hours after the fire, the Safe was removed, and so hot was it, that several hours were required for it to cool off. Our office was in the second story of a large brick building, all the wood used in construction of said house being pitch pine. While the Safe was red hot, one of the walls tumbled in, and so injured the lock that it was necessary to break the door open. From this test, we feel no hesitancy in recommending "Rich's Patent Salamander Safe" as entirely fire proof.

GORRIS & KING.

Marion, Ala., Sept. 15th, 1846.

*Still other Tests in the Great Fire of July 19, 1845.*

The undersigned purchased of A. S. Martin, No. 138½ Water street, one of Rich's Improved Patent Salamander Safes, which was in our store, No. 54 Exchange place. The store was entirely consumed in the great conflagration on the morning of the 19th inst. The safe was taken from the ruins 52 hours after, and on opening it, the books and papers were found entirely uninjured by fire, and only slightly wet—the leather on some of the books was parched by the extreme heat.

RICHARDS & CHRONKITE.

Benton, Miss., December 27, 1845.

One of Rich's Improved Salamander Safes, which I purchased on the 2d of June last of A. S. Marvin, 138½ Water street, agent for the manufacturer, was exposed to the most intense heat during the late dreadful conflagration. The store which I occupied, No. 46 Broad street, was entirely consumed; the safe fell from the 3d story, about 15 feet, into the cellar, and remained there 14 hours, and when found, I am told, and from its appearance afterwards, should judge that it had been heated to a red heat. On opening it, the books and papers were found not to have been touched by fire. I deem this ordeal sufficient to confirm fully the reputation that Rich's safe has already obtained for preserving its contents against all hazards.

(Signed.)

WM. BLOODGOOD.

New York, 21st July, 1845.

Reference made to upwards of nine hundred and fifty merchants, cashiers, brokers, and officers of courts and counties, who have Rich's Safe's in use.

The above safes are finished in the neatest manner, and can be made to order at short notice, of any size and pattern, and fitted to contain plate, jewelry, etc. Prices from \$50 to \$500 each. For sale by

A. S. MARVIN, General Agent,  
138½ Water st., N. Y.

Also by Isaac Bridge 76 Magazine street, New Orleans.

Also by Lewis M. Hatch, 130 Meeting street Charleston, S. C.

16 if

**FRENCH AND BAIRD'S PATENT SPARK ARRESTER.**

**TO THOSE INTERESTED IN**  
Railroads, Railroad Directors and Managers are respectfully invited to examine an improved SPARK ARRESTER, recently patented by the undersigned.

Our improved Spark Arresters have been extensively used during the last year on both passenger and freight engines, and have been brought to such a state of perfection that no annoyance from sparks or dust from the chimney of engines on which they are used is experienced.

These Arresters are constructed on an entirely different principle from any heretofore offered to the public. The form is such that a rotary motion is imparted to the heated air, smoke and sparks passing through the chimney, and by the centrifugal force thus acquired by the sparks and dust they are separated from the smoke and steam, and thrown into an outer chamber of the chimney through openings near its top, from whence they fall by their own gravity to the bottom of this chamber; the smoke and steam passing off at the top of the chimney, through a capacious and unobstructed passage, thus arresting the sparks without impairing the power of the engine by diminishing the draught or activity of the fire in the furnace.

These chimneys and arresters are simple, durable and neat in appearance. They are now in use on the following roads, to the managers and other officers of which we are at liberty to refer those who may desire to purchase or obtain further information in regard to their merits:

R. L. Stevens, President Camden and Amboy Railroad Company; Richard Peters, Superintendent Georgia Railroad, Augusta, Ga.; G. A. Nicolls, Superintendent Philadelphia, Reading and Pottsville Railroad, Reading, Pa.; W. E. Morris, President Philadelphia, Germantown and Norristown Railroad Company, Philadelphia; E. B. Dudley, President W. and R. Railroad Company, Wilmington, N. C.; Col. James Gadsden, President S. C. and C. Railroad Company, Charleston, S. C.; W. C. Walker, Agent Vicksburg and Jackson Railroad, Vicksburg, Miss.; R. S. Van Rensselaer, Engineer and Sup't Hartford and New Haven Railroad; W. R. McKee, Sup't Lexington and Ohio Railroad, Lexington, Ky.; T. L. Smith, Sup't New Jersey Railroad Trans. Co.; J. Elliott, Sup't Motive Power Philadelphia and Wilmington Railroad, Wilmington, Del.; J. O. Sterns, Sup't Elizabethtown and Somerville Railroad; R. R. Cuyler, President Central Railroad Company, Savannah, Ga.; J. D. Gray, Sup't Macon Railroad, Macon, Ga.; J. H. Cleveland, Sup't Southern Railroad, Monroe, Mich.; M. F. Chittenden, Sup't M. P. Central Railroad, Detroit, Mich.; G. B. Fisk, President Long Island Railroad, Brooklyn.

Orders for these Chimneys and Arresters, addressed to the subscribers, care Messrs. Baldwin & Whitney, of this city or to Hinckley & Drury, Boston, will be promptly executed. FRENCH & BAIRD.

N. B.—The subscribers will dispose of single rights, or rights for one or more States, on reasonable terms.

Philadelphia, Pa., April 6, 1844.

•• The letters in the figures refer to the article given in the Journal of June, 1844.

ja45

**PATENT HAMMERED RAILROAD, SHIP and Boat Spikes.** The Albany Iron and Nail Works have always on hand, of their own manufacture, a large assortment of Railroad, Ship and Boat Spikes, from 2 to 12 inches in length, and of any form of head. From the excellence of the material always used in their manufacture, and their very general use for railroads and other purposes in this country, the manufacturers have no hesitation in warranting them fully equal to the best spikes in market, both as to quality and appearance. All orders addressed to the subscriber at the works, will be promptly executed. JOHN F. WINSLOW, Agent.

Albany Iron and Nail Works, Troy, N. Y. The above spikes may be had at factory prices, of Erastus Corning & Co., Albany; Hart & Merritt, New York; J. H. Whitney, do.; E. J. Eting, Philadelphia; Wm. E. Coffin & Co., Boston.

ja45

**MACHINE WORKS OF ROGERS,** Ketchum & Grosvenor, Patterson, N. J. The undersigned receive orders for the following articles, manufactured by them of the most superior description in every particular. Their works being extensive and the number of hands employed being large, they are enabled to execute both large and small orders with promptness and despatch.

**Railroad Work.**

Locomotive steam engines and tenders; Driving and other locomotive wheels, axles, springs & flange tires; car wheels of cast iron, from a variety of patterns, and chills; car wheels of cast iron with wrought tires; axles of best American refined iron; springs; boxes and bolts for cars.

Cotton, Wool and Flax Machinery of all descriptions and of the most improved patterns, style and workmanship.

Mill gearing and Millwright work generally; hydraulic and other presses; press screws; callenders; lathes and tools of all kinds; iron and brass castings of all descriptions.

ROGERS, KETCHUM & GROSVENOR, 145 Paterson, N. J., or 60 Wall street, N. York.

**PATENT RAILROAD, SHIP AND BOAT Spikes.** The Troy Iron and Nail Factory keeps constantly for sale a very extensive assortment of Wrought Spikes and Nails, from 3 to 10 inches, manufactured by the subscriber's Patent Machinery, which after five years' successful operation, and now almost universal use in the United States (as well as England, where the subscriber obtained a patent) are found superior to any ever offered in market.

Railroad companies may be supplied with Spikes having countersink heads suitable to holes in iron rails, to any amount and on short notice. Almost all the railroads now in progress in the United States are fastened with Spikes made at the above named factory—for which purpose they are found invaluable, as their adhesion is more than double any common spikes made by the hammer.

All orders directed to the Agent, Troy, N. York will be punctually attended to.

HENRY BURDEN, Agent.

Spikes are kept for sale, at Factory Prices, by I. & J. Townsend, Albany, and the principal Iron merchants in Albany and Troy; J. I. Brower, 922 Water St., New York; A. M. Jones, Philadelphia; T. Janviers, Baltimore; Degrand & Smith, Boston.

•• Railroad Companies would do well to forward their orders as early as practicable, as the subscriber is desirous of extending the manufacturing so as to keep pace with the daily increasing demand.

ja45

**DAVENPORT & BRIDGES CONTINUE**

to Manufacture to Order, at their Works, in Cambridgeport, Mass., Passenger and Freight Cars of every description, and of the most improved pattern. They also furnish Snow Ploughs and Chilled Wheels of any pattern and size. Forged Axles, Springs, Boxes and Bolts for Cars at the lowest prices. All orders punctually executed and forwarded to any part of the country.

Our Works are within fifteen minutes ride from State street, Boston—coaches pass every fifteen minutes.

## THE HERRON RAILWAY TRACK,

As seen stripped of the top ballasting

A GOLD MEDAL AWARDED THE INVENTOR BY THE AMERICAN INSTITUTE.

**THE UNDERSIGNED RESPECTFULLY** invites the attention of Engineers, and Railroad Companies, to some highly important improvements he has recently made in the Herron system of the trestle for the purpose of giving an additional, and effectual support to the joints of the Rails, which rest upon it. Should these joint blocks become chafed and worn by the working, and imbedding of the chairs, as is now the case on all Railroads, they can be readily replaced without any derangement of the timbers less liable to wear.

The above cut represents the "Herron Track" as it is laid on the Philadelphia and Reading, and on the Baltimore and Susquehanna Railroads. The intersection of the sills of the trestle is 5 feet from centre to centre, while in the new construction they are only 2½ feet. This renders the string piece unnecessary, thus removing the only objectionable feature found in the Track.

The result of experience has proved that all Tracks constructed with longitudinal timbers, such as mud sills, and more especially, the continuous bearing string pieces retain the rain water that falls between the Rails, which, being thus confined, settles along those timbers, and accumulating in quantity flows rapidly along them on the descending grades, washing out the earth from under the timber, and frequently causing large breaches in the embankments of the road. Whereas all water intercepted by the oblique sills of the trestle, is discharged immediately into the side ditches.

In the 5 foot plan, the Track occupies a Road bed nearly 11 feet wide, while the new construction takes

but 8 feet; the timber being more concentrated under the Rails. A block of hard wood, about 2 feet long and 15 inches wide, is introduced into a square of the trestle for the purpose of giving an additional, and effectual support to the joints of the Rails, which rest upon it. Should these joint blocks become chafed and worn by the working, and imbedding of the chairs, as is now the case on all Railroads, they can be readily replaced without any derangement of the timbers less liable to wear.

The following is a general estimate of its cost near the seaboard. In the interior it will be considerably less.

ESTIMATE OF THE PROBABLE COST OF ONE MILE.		
4,994 Timbers, 11 ft. long, 3 x 6 inches =	68,696 ft. b.m., at \$10 =	\$686 96
587 Oak joint blocks 2 ft. x 3 x 15 in. =	4,403 ft. b.m., at \$13 =	57 24
13,000 Spikes = 2,250 lbs. at 4½ cts. =		101 25
Workmanship free of patent charge =		600 00

Cost of one mile including the laying of the Rail.....\$1,445 45

He has made other important improvements, which will be shown in properly proportioned models, that give a much better idea of the great strength of the Track than a drawing will do.

Sales of the Patent right to all the distant States will be made on liberal terms.

JAMES HERRON.  
Civil Engineer and Patentee.  
No. 277 South Tenth St., Philadelphia. 331f

# ENGLISH PATENT WIRE ROPES—FOR THE USE OF MINES, RAILWAYS, ETC.—

for sale or imported to order by the subscriber. These Ropes are manufactured on an entirely different principle from any other, and are now almost exclusively used in the collieries and on the railways in Great Britain, where they are considered to be greatly superior to hempen ones, or iron chains, as regards safety, durability and economy. The plan upon which they are made effectually secures them from corrosion in the interior, as well as the exterior of the rope, and gives a greater compactness and elasticity than is found in any other manufacture.

Many of these ropes have been in constant operation in the different mines in England, and on the Blackwall and other inclined planes, for three and four years, and are still in good condition.

They have been applied to almost every purpose for which hempen ropes have been used—mines, heavy cranes, standing rigging, window cords, lightning conductors, signal halyards, tiller ropes, etc. Reference is made to the annexed statement for the relative strength and size. Testimonials from the most eminent engineers in England can be shown as to their efficiency, and any additional information required respecting the different descriptions and application will be given by

ALFRED L. KEMP,  
75 Broad street, New York, sole agent in the United States.

Statement of Trial made at the Woolwich Royal Dock Yard, of the Patent Wire Ropes, as compared with Hempen Ropes and Iron Chains of the same strength.—October, 1841.

WIRE ROPES.			HEMPEN ROPES.			CHAINS.		STRENGTH Tons.
Wire gauge number.	Circumference of rope.	Weight per fathom.	Circumference of rope.	Weight per fathom.		Weight per fathom.	Diameter of iron.	
	INCH.	LBS. OZ.	INCH.	LBS. OZ.		LBS.	INCH.	
11	4½	13 5	10	24 -		50	15-16	20
13	3½	8 3	8½	16 -		27	11-16	13½
14	3½	6 11	7½	12 8		17	9-16	10½
15	2½	5 2	6½	9 4		13½	1-3	7½
16	2½	4 3	6	8 8		10½	7-16	7

N.B. The working load, with a perpendicular lift, may be taken at 6 cwt. for every lb. weight per fathom, so that a rope weighing 5 lbs. per fathom would safely lift 3360 lbs., and so on in proportion. 1y24

105 Chestnut Street,  
PHILADELPHIA, PA.

This is the only periodical having a general circulation throughout the Union, in which all matters connected with public works can be brought to the notice of all persons in any way interested in these undertakings. Hence it offers peculiar advantages for advertising times of departure, rates of fare and freight, improvements in machinery, materials, as iron, timber, stone, cement, etc. It is also the best medium for advertising contracts, and placing the merits of new undertakings fairly before the public.

TERMS.—Five Dollars a year, in advance.

The Depot in Boston is on Haymarket Square.

Passengers are not allowed to carry Baggage above \$50 in value, and that personal Baggage, unless notice is given, and an extra amount paid, at the rate of the price of a Ticket for every \$500 additional value.

1 y 31 CHAS. MINOT, Sup't.

## THE BEST RAILROAD ROUTE TO THE Lake and Buffalo, from Cincinnati.

Take Cars to Xenia, 65 miles; take Stage to Mansfield, 88 miles; thence by Cars to Sandusky, 56 miles to the Lake; thence Steamboat to Buffalo, 230 miles.

Fare from Cincinnati to Sandusky.....\$8 00

" " Sandusky to Buffalo, Cabin..... 6 00

" " " " " Steerage..... 4 50

Fare by this route, although the cheapest across the state, will be reduced in a short time, railroad lengthened, and speed increased.

Leave Cincinnati in the morning, arrive at Columbus at night.

Leave Columbus in the morning, arrive at Sandusky same day.

Leave Sandusky, by Boat, in the morning, arrive at Buffalo next morning in time for the Cars north and east for Niagara Falls, Canada, Saratoga Springs, Troy, Albany, Boston, New York, Washington, or Philadelphia.

Passengers should not omit to pay their fare through from Cincinnati to Sandusky, or from Columbus to Sandusky via Mansfield; as this route is the only one that secures 56 miles [this road is run over in 2h. 50m.,] most railroad which is new, and is the shortest, cheapest and most expeditious across the state.

Fares on the New York railroads are about to be reduced.

31 ly Sandusky, Ohio. B. HIGGINS, Sup't., etc. M. & S. C. R. R. Co.

## SUMMER ARRANGEMENT.—NEW YORK AND ERIE RAILROAD LINE, from April 1st until further notice, will

run daily (Sundays excepted) between the city of New York and Middletown, Goshen, and intermediate places, as follows:

### FOR PASSENGERS—

Leave New York at 7 A. M. and 4 P. M.

" Middletown at 6½ A. M. and 5½ P. M.

FARE REDUCED TO \$1 25 to Middletown—way in proportion. Breakfast, supper and berths can be had on the steamboat.

### FOR FREIGHT—

Leave New York at 5 P. M.

" Middletown at 12 M.

The names of the consignee and of the station where to be left, must be distinctly marked upon each article shipped. Freight not received after 5 P. M. in New York.

Apply to J. F. Clarkson, agent, at office corner of Duane and West sts. H. C. SEYMOUR, Sup't. March 25th, 1846.

Stages run daily from Middletown, on the arrival of the afternoon train, to Millford, Carbondale, Honesdale, Montrose, Towanda, Owego, and West; also to Monticello, Windsor, Binghamton, Ithaca, etc., etc. Agent on board. 13 if

## NORWICH AND WORCESTER RAILROAD.

Summer Arrangement, commencing Monday, April 6, 1846.

Accommodation Trains, daily, except Sunday. Leave Norwich, at 6 a.m., and 4 p.m. Leave Worcester, at 10 a.m., and 4½ p.m.

The morning Accommodation Trains from Norwich, and from Worcester, connect with the trains of the Boston, and Worcester and Western railroads each way.

The Evening Accommodation Train from Worcester connects with the 1½ p.m. train from Boston.

New York Train via Long Island Railroad: Leave Allyn's Point for Boston, about 1 p.m., daily, except Sunday.

Leave Worcester for New York, about 10 a.m., stopping at Webster, Danielsonville, and Norwich.

New York Train via Steamboat—Leave Norwich for Boston, every morning, except Monday, on the arrival of the steamboat from New York, stopping at Norwich and Danielsonville.

Leave Worcester for New York, upon the arrival of the train from Boston, at about 4½ p.m., daily, except Sunday, stopping at Webster, Danielsonville and Norwich.

Freight Trains daily each way, except Sunday.—Special contracts will be made for cargoes, or large quantities of freight, on application to the superintendent.

Fares are Less when paid for Tickets than when paid in the Cars. 31 ly J. W. STOWELL, Sup't.

**TROY RAILROADS.—IMPORTANT NOTICE.**—Troy and Greenbush Railroad, forming a continuous track from Boston to Buffalo and Saratoga Springs.

This road is new, and laid with the heaviest iron H rail. Trains will always be run on this road connecting at Greenbush each way with the trains to and from Boston and intermediate places, leaving Greenbush daily at 1½ p.m. and 6 p.m., or on arrival of the trains from Boston; leave Troy at 7½ a.m. and 4½ p.m., or to connect with trains to Boston.

Trains also run hourly on this road between Troy and Albany. Running time between Greenbush and Troy, 15 minutes.

#### TROY AND SCHENECTADY RAILROAD.

This road is laid its entire length with the heaviest H rail— which is not the fact with the road from Albany. Trains will always be run on this road connecting each way, to and from Buffalo and intermediate places. Leave Troy for Buffalo at 7½ a.m. and 1 p.m. and 6½ p.m., or to connect with the trains for the west; leave Schenectady at 2½ a.m., 8½ a.m., 1 p.m. and 3½ p.m., or on arrival of the trains from Buffalo and intermediate places.

#### TROY AND SARATOGA RAILROAD.

THE ONLY DIRECT ROUTE.

No change of passenger, baggage or other cars on this route. Cars leave Troy for Ballston, Saratoga Springs, Lake George and White Hall at 7½ a.m., (arriving one hour in advance of the train from Albany,) and at 3½ p.m. Returning, leave Saratoga at 9 a.m. and 3½ p.m., (reaching Troy in time for the evening boats to New York.) Cars also leave Troy for the Burrough at 3½ p.m. and 7 p.m., connecting with packet boats for the north. This takes passengers from New York and Boston to Montreal in 44 hours.

N.B. Travellers will find the routes through Troy most convenient and economical, and as expeditious as any other. The steamboats to and from New York land within a few steps of the railroad office, and passengers are taken up and landed by the different railroad lines at the doors of principal hotels, thus saving all necessity for, and annoyance from, hack drivers, cabmen, runners, etc.

Aug. 3, 1846.

1y 32

#### BALTIMORE AND OHIO RAILROAD.

**MAIN STEM.** The Train carrying the Great Western Mail leaves Baltimore every morning at 7½ and Cumberland at 8 o'clock, passing Ellicott's Mills, Frederick, Harpers Ferry, Martinsburgh and Hancock, connecting daily each way with the Washington Trains at the Relay House seven miles from Baltimore, with the Winchester Trains at Harpers Ferry—with the various railroad and steamboat lines between Baltimore and Philadelphia and with the lines of Post Coaches between Cumberland and Wheeling and the fine Steamboats on the Monongahela Slack Water between Brownsville and Pittsburgh. Time of arrival at both Cumberland and Baltimore 5½ P. M. Fare between those points \$7, and 4 cents per mile for less distances. Fare through to Wheeling \$11 and time about 36 hours, to Pittsburgh \$10, and time about 33 hours. Through tickets from Philadelphia to Wheeling \$13, to Pittsburgh \$12. Extra train daily except Sundays from Baltimore to Frederick at 4 P. M., and from Frederick to Baltimore at 8 A. M.

#### WASHINGTON BRANCH.

Daily trains at 9 A. M. and 5 P. M. and 12 a. night from Baltimore and at 6 A. M. and 5½ P. M. from Washington, connecting daily with the line North, South and West, at Baltimore, Washington and the Relay house. Fare \$1 60 through between Baltimore and Washington, in either direction, 4 cents per mile for intermediate distances. 13y1

**THE SUBSCRIBER IS PREPARED TO** execute at the Trenton Iron Works, orders for Railroad Iron of any required pattern, and warranted equal in every respect in point of quality to the best American or imported Rails. Also on hand and made to order, Bar Iron, Braziers' and Wire Rods, etc., etc.

PETER COOPER 17 Burling Slip.

1y10

New York.

#### NEW RAILROAD ROUTE FROM BUFFALO TO CINCINNATI.

Passengers destined for Columbus and Cincinnati.

O. Louisville, Ky., St. Louis, Mo., Memphis, Tenn., Vicksburg, Natches, New Orleans, and all intermediate ports, will find a new, and the most expeditious and comfortable Route, by taking Steamboats at Buffalo, landing at Sandusky City, Ohio, distance.....230 miles.

F. WINTER, Forwarding Agent, C. R. R. Savannah, Aug. 15th, 1846. 1y34

**GREAT SOUTHERN MAIL LINE! VIA** Washington city, Richmond, Petersburg, Weldon and Charleston, S. C., direct to New Orleans. The only Line which carries the Great Southern Mail, and Twenty-four Hours in advance of Bay Line, leaving Baltimore same day.

Passengers leaving New York at 4½ P.M., Philadelphia at 10 P.M., and Baltimore at 6½ A.M., proceed without delay at any point, by this line, reaching Richmond in eleven, Petersburg in thirteen and a half hours, and Charleston, S. C., in two days from Baltimore.

Fare from Baltimore to Charleston.....\$21 00  
" " " " Richmond..... 6 60

For Tickets, or further information, apply at the Southern Ticket Office, adjoining the Washington Railroad Office, Pratt street, Baltimore, to STOCTON & FALLS, Agents.

**RAILROAD SCALES.—THE ATTENTION** of Railroad Companies is particularly requested to Ellicott's Scales, made for weighing loaded cars in trains, or singly, they have been the inventors, and the first to make platform scales in the United States; supposing that an experience of 20 years has given a knowledge and superior advantage in the business.

The levers of our scales are made of wrought iron, all the bearers and fulcrums are made of the best cast steel, laid on blocks of granite, extending across the pit, the upper part of the scale only being made of wood. E. Ellicott has made the largest Railroad Scale in the world, its extreme length was one hundred and twenty feet, capable of weighing ten loaded cars at a single draft. It was put on the Mine Hill and Schuylkill Haven Railroad.

We are prepared to make scales of any size to weigh from five pounds to two hundred tons.

ELLICOTT & ABBOTT.  
Factory, 9th street, near Coates, cor. Melon st.  
Office, No. 3 North 5th street, Philadelphia, Pa. 1y35

J. EDGAR THOMSON,  
Ch. Eng. and Gen. Agent.  
Augusta, Sept. 2d, 1846. \*44 1y

**THE WESTERN AND ATLANTIC** Railroad.—This Road is now in operation to Oothcaloga, a distance of 80 miles, and connects daily (Sundays excepted) with the Georgia Railroad.

From Kingston, on this road, there is a tri-weekly line of stages, which leave on the arrival of the cars on Tuesday, Thursday and Saturday, for Warrenton, Huntsville, Decatur and Tusculumbia, Alabama, and Memphis, Tennessee.

On the same days, the stages leave Oothcaloga for Chattanooga, Jasper, Murfreesborough, Knoxville and Nashville, Tennessee.

This is the most expeditious route from the east to any of these places.

CHAS. F. M. GARNETT,  
Chief Engineer.  
Atlanta, Georgia, April 16th, 1846. 1y1

**TO RAILROAD COMPANIES AND MANUFACTURERS** of railroad Machinery. The subscribers have for sale Am. and English bar iron, of all sizes; English blister, cast, shear and spring steel; Juniata rods; car axles, made of double refined iron; sheet and boiler iron, cut to pattern; tiers for locomotive engines, and other railroad carriage wheels, made from common and double refined B. O. iron; the latter a very superior article. The tires are made by Messrs. Baldwin & Whitney, locomotive engine manufacturers of this city. Orders addressed to them, or to us, will be promptly executed.

When the exact diameter of the wheel is stated in the order, a fit to those wheels is guaranteed, saving to the purchaser the expense of turning them out inside. THOMAS & EDMUND GEORGE,  
E. cor. 13th and Market sts., Philad., Pa. 1y

**LITTLE MIAMI RAILROAD.—OPEN** TO SPRINGFIELD—Distance 84 miles—

connecting at Xenia and Springfield with Messrs. Neil, Moore, & Co's. daily daylight lines of stages going east and north, to Columbus, Zanesville, Wheeling, Cleveland, and Sandusky City, via Urbana, Bellefontaine, Kenton, and the Mad river and lake Erie railroad, or Columbus, Delaware, and the Mansfield and Sandusky City railroad—forming, by these connections, the cheapest and most expeditious route to Buffalo, Niagara Falls, Rochester, Albany, New York, and Boston.

On and after Thursday, August 13, 1846, until further notice, a Passenger train will run as follows: Leave Cincinnati daily at 9 A. M., for Milford, Foster's Crossing, Deerfield, Morrow, Port Ancient, Freeport, Waynesville, Spring Valley, Xenia, Old Town, Yellow Springs, and Springfield.

Returning, will leave Springfield at 4 hours 35 minutes A. M. A line of Hacks runs in connection with the Cars, between Deerfield and Lebanon.

Fare—From Cincinnati to Lebanon...\$1 00  
" " " Xenia..... 1 50  
" " " Springfield.. 2 00  
" " " Columbus... 4 00  
" " " Sandusky city 8 00

The Passenger trains runs in connection with Strader & Gorman's line of Mail Packets to Louisville.

Tickets can be procured at the Broadway Hotel, Dennison House, or at the Depot of the Company, on East Front street.

Further information and through tickets for the Stage lines, may be procured at P. Campbell, Agent on Front street, near Broadway.

The company will not be responsible for baggage beyond 50 dollars in value, unless the same is returned to the conductor or agent, and freight paid at of a passage for every \$500 in value over that amount.

The 1½ P. M. train from Cincinnati, and the 2 40 P. M. train from Xenia, will be discontinued on and after Monday, the 10th instant.

A freight train will run daily.  
47½ W. H. CLEMENT, Sup't.

**PHILADELPHIA, WILMINGTON & BALTIMORE RAILROAD.—1847.**

Winter Arrangement.

Philadelphia for Baltimore...8 a.m. and 4 p.m.  
Baltimore for Philadelphia...9 a.m. and 8 p.m.

Connecting in Baltimore with Mail Lines south and west, as per notice of the Baltimore and Ohio Railroad—and with Mail Lines north from Philadelphia, both morning and afternoon.

Sundays, the Morning Lines do not run in either direction.

Accommodation train from Wilmington to Philadelphia, leaves Wilmington at 8 a.m., and returns at 2 p.m.

J. R. TRIMBLE,  
2½ Engineer and General Superintendent.

**LAWRENCE'S ROSENDALE HYDRAULIC CEMENT.** This cement is warranted equal to any manufactured in this country, and has been pronounced superior to Francis' "Roman." Its value for Aqueducts, Locks, Bridges, Floors and all Masonry exposed to dampness, is well known, as it sets immediately under water, and increases in solidity for years.

For sale in lots to suit purchasers, in tight papered barrels, by JOHN W. LAWRENCE,  
143 Front street, New York.

Orders for the above will be received and promptly attended to at this office. 32 1y

**SPRING STEEL FOR LOCOMOTIVES,** Tenders and Cars. The Subscriber is engaged in manufacturing Spring Steel from 1½ to 6 inches in width, and of any thickness required: large quantities are yearly furnished for railroad purposes, and wherever used, its quality has been approved of. The establishment being large, can execute orders with great promptitude, at reasonable prices, and the quality warranted. Address  
JOAN F. WINSLOW, Agent,  
Albany Iron and Nail Works,

**VALUABLE PROPERTY ON THE MILL Dam For Sale.** A lot of land on Gravelly Point, so called, on the Mill Dam, in Roxbury, fronting on and east of Parker street, containing 68,497 square feet, with the following buildings thereon standing.

Main brick building, 120 feet long, by 46 ft wide, two stories high. A machine shop, 47x43 feet, with large engine, face, screw, and other lathes, suitable to do any kind of work.

Pattern shop, 35x32 ft. with lathes, work benches,

Work shop, 86x35 feet, on the same floor with the pattern shop.

Forge shop, 118 feet long by 44 feet wide on the ground floor, with two large water wheels, each 16 feet long, 9 ft diameter, with all the gearing, shafts, drums, pulleys, &c., large and small trip hammers, furnaces, forges, rolling mill, with large balance wheel and a large blowing apparatus for the foundry.

Foundry, at end of main brick building, 60x45 feet two stories high, with a shed part 45x30 feet, containing a large air furnace, cupola, crane and corn oven.

Store house—a range of buildings for storage, etc., 200 feet long by 20 wide.

Locomotive shop, adjoining main building, fronting on Parker street, 54x25 feet.

Also—A lot of land on the canal, west side of Parker st., containing 6000 feet, with the following buildings thereon standing:

Boiler house 50 feet long by 30 feet wide, two stories.

Blacksmith shop, 49 feet long by 30 feet wide.

For terms, apply to HENRY ANDREWS, 48 State st., or to CURTIS, LEAVENS & CO., 106 State st., Boston, or to A. & G. RALSTON & Co., Philadelphia.

**TO RAILROAD COMPANIES AND BUILDERS OF MARINE AND LOCOMOTIVE ENGINES AND BOILERS.**

#### PASCAL IRON WORKS.

#### WELDED WROUGHT IRON TUBES.

From 4 inches to 4 ft in calibre and 2 to 12 feet long, capable of sustaining pressure from 400 to 1500 lbs. per square inch, with Stop Cocks, T's, L's, and other fixtures to suit, fitting together, with screw joints, suitable for STEAM, WATER, GAS, and for LOCOMOTIVE and other STEAM BOILER FLUES.

Manufactured and for sale by  
**MORRIS, TASKER & MORRIS.**  
Warehouse S. E. Corner of Third & Walnut Streets,  
**PHILADELPHIA.**

**PATENT INDESTRUCTIBLE WATER Pipes.** The subscribers continue to manufacture the above Pipes, of all the sizes and strength required for City or Country use, and would invite individuals or companies to examine its merits.—This pipe, unlike cast iron and lead, imparts neither color, oxide or taste, being formed of strongly riveted sheet iron, and evenly lined on the inside with hydraulic cement. While in the process of laying, it has a thick covering externally of the same—thus forming nature's own conduit of stone. The iron being thoroughly enclosed on both sides with cement, precludes the possibility of rust or decay, and renders the pipe truly indestructible. The prices are less than those of iron or lead. We also manufacture Basins and D. Traps, for Water Closets, on a new principle, which we wish the public to examine at 113 Fulton street, New York.

28th J. BALL & CO.

**TO LOCOMOTIVE AND MARINE ENGINE Boiler Builders.** Pascal Iron Works, Philadelphia. Welded Wrought Iron Flues, suitable for Locomotives, Marine and other Steam Engine Boilers, from 2 to 5 inches in diameter. Also, Pipes for Gas, Steam and other purposes; extra strong Tube for Hydraulic Presses; Hollow Pistons for Pumps of Steam Engines, etc. Manufactured and for sale by

**MORRIS TASKER & MORRIS,**  
Warehouse S. E. corner 3d and Walnut Sts., Philadelphia.

## NORRIS' LOCOMOTIVE WORKS.

BUSH HILL, PHILADELPHIA, Pennsylvania.

**MANUFACTURE** their Patent 6 Wheel Combined and 8 Wheel Locomotives of the following descriptions, viz:

Class 1,	15 inches	Diameter of	Cylinder,	× 20 inches	Stroke.
" 2,	14	"	"	× 24	"
" 3,	14½	"	"	× 20	"
" 4,	12½	"	"	× 20	"
" 5,	11½	"	"	× 20	"
" 6,	10½	"	"	× 18	"

With Wheels of any dimensions, with their Patent Arrangement for Variable Expansion. Castings of all kinds made to order: and they call attention to their Chilled Wheels, for the Trucks of Locomotives, Tenders and Cars.

**NORRIS, BROTHERS.**

**THE NEWCASTLE MANUFACTURING** Company continue to furnish at the Works, situated in the town of Newcastle, Del., Locomotive and other steam engines, Jack screws, Wrought iron work and Brass and Iron castings, of all kinds connected with Steamboats, Railroads, etc.; Mill Gearing of every description; Cast wheels (chilled) of any pattern and size, with Axles fitted, also with wrought tires, Springs, Boxes and bolts for Cars; Driving and other wheels for Locomotives.

The works being on an extensive scale, all orders will be executed with promptness and despatch. Communications addressed to Mr. William H. Dobbs, Superintendent, will meet with immediate attention.

ANDREW C. GRAY,  
President of the Newcastle Manuf. Co.

**RAILROAD IRON AND LOCOMOTIVE** Tyres imported to order and constantly on hand by  
A. & G. RALSTON

Mar. 30th 4 South Front St., Philadelphia.

**KEARNEY FRIE BRICK.** F. W. BRINLEY, Manufacturer, Perth Amboy, N. J. Guaranteed equal to any, either domestic or foreign. Any shape or size made to order. Terms, 4 mos. from delivery of brick on board. Refer to

## State Works of Ohio.

The Columbus correspondent (probably one of the Editors) of the Cincinnati Gazette—in a late letter—gives the following account in relation to the Internal Improvements and Public Works of the State of Ohio, which will be read with interest. The writer says:

In the absence of any proceedings of interest in either House, I have devoted considerable time to an examination of the finances of our Public Works—deriving my details from the very interesting Report of the Board, and from such other sources as were necessary. They are in fact the financial barometer of the State, our tax roll increasing or diminishing with the receipts from our Canals. It is a well known fact that more money has leaked out at the Treasury through those charged with our public improvements, than wasted by breeches—and we have Governor Marcy's authority for saying the latter are something of an item.

The first fact cognizant by the report is this—a reduction in the expenditures and an increase in the receipts. This is cheering—for since 1840, with an increased line of Canals and a greatly increased debt, our receipts have been growing beautifully less. Four hundred and twenty-two miles of Canals, with over nine millions six hundred and fifty thousand dollars of debt, added from 1836 to 1840, and yet forsooth a decrease in receipts from the very year the people hoped to find some relief.

## EASTERN DIVISION:

Comprising the Ohio, Walhoning, and Hocking Canals, Muskingum Improvements, and Eastern part of the National Road, is under the superintendence of Jacob Blickensderfer, Junior.

## Ohio Canal.

Receipts from Tolls, Fines and Water-rents.....	\$336,339 69
Disbursement for same period.....	69,371 50
Nett receipts.....	\$266,968 19
Increase of Tolls, &c., over last year..	\$75,970 36
Decrease of expenses do ..	47,967 34

Nett gain ..... \$123,937 70

The repairs, it appears from the Report have been extensive, and several substantial and economical improvements introduced, as substituting cast iron arches in place of decayed stone culverts.

Cost of the Ohio Canal, including branches.....	\$4,695,903 00
Interest on same, do. do.....	281,712 18
Nett receipts, do. do.....	266,968 19

Our first work of Public Improvement promises well. It has no foreign carrying trade—dependent entirely upon its own resources. Besides, the increase from tolls on the cereal product, which, as the country improves, will be greatly augmented, it has other sources of revenue in the immense beds of iron and coal in the north eastern part of the State, with water power on the spot. The miserable policy of opening the sluice-ways for the pauper labor of Europe can alone retard their proper development.

The table annexed is an interesting one, showing that the export exceed the import as 5½ to 1; wheat and flour constituting 3-7 of

the former, and the coal trade 1-7 of the entire business of the canal.

Articles.	Cleveland.		Portsmouth.

## Hocking Canal.

Receipts from Tolls, Rents and Fines..	\$5,383 54
Disbursements for Superintendence, &c.	3,651 13

Cost of the Hocking Canal.....	\$1,739 41
Interest on same.....	\$975,481 01
Receipts on Running expenses.....	58,528 86
There is an item of \$1,050 13 in the Report, which belongs to construction account, and of course not included in the estimate of the profit and loss of each work.	1,732 41

There is an item of \$1,050 13 in the Report, which belongs to construction account, and of course not included in the estimate of the profit and loss of each work.

## Walhoning Canal.

Receipts from Tolls, Rents and Fines..	\$1,190 70
Disbursements for Superintendence, &c.	1,383 54
Cost of Construction.....	\$607,268 99
Interest on same.....	36,436 13
Excess of Expenditure over Receipts..	122 84

There was a decrease in the disbursements this year over the last, of \$1,754 07; receipts were less by \$92 25. There was not a supply of boats for the business.

## WESTERN DIVISION:

Consisting of the Miami and Warren county Canal, Miami Extension, and Wabash and Erie Canals, Western Reserve and Maumee Road, and Western Division of National Road, under charge of the veteran Forrer.

The Miami and Extension, with the Wabash and Erie, should properly be considered together, as tolls are received at Cincinnati and Toledo for all through freight, which makes the central portion appear to great advantage. As there is some local interest with your readers in the first, it is separated.

## Miami Canal.

Receipts from Tolls, Rents and Fines,	\$93,057 28
Disbursements for large Repairs, Superintendence, &c.....	54,344 99

Nett Receipts.....	\$38,712 99
Increase in Receipts over last year..	15,813 50
Cost of Construction of Miami and Warren Canal.....	\$1,237,552 00
Interest on same.....	71,253 00
Nett Receipts.....	38,712 99

The expenses for repairs were unusually heavy, and the Canal had been so long neglected as to render it difficult of navigation, by being filled up with sand and mud. To clear it was a very large item. It was also obstructed by ice forty-nine days, and nearly a month lost by breaks, which would not have occurred, if it had been kept in proper order.

## Extra Expenses.

Hamilton and Cincinnati Culvert.....	\$7,314 17
New Tumbles, Bridges, &c.....	2,062 24
Removing the Deposits.....	22,000 00

Add nett Receipts as above.....	\$31,776 41
	38,742 00

\$70,518 41

This would exceed the interest account by \$7,888 00. Including Warren county Canal, is adding \$200,000 to the cost, and not a cent income.

## Miami Extension and Wabash Canals.

Cost of Miami Extension from Dayton to mouth of Loramie's Creek.....	\$436,750 60
Loramie's Creek to north end of Deep Cut.....	1,379,267 32
Deep Cut to junction of Wabash and Erie Canals.....	323,500 00

Canals.....	8,135 10
	\$27,235 96

Interest on the united cost of both Works.....	\$373,568 52
Nett Receipts on the same.....	\$113,991 51
There is an item in the Report of \$29,301, which belongs to Construction account.	

If no untoward accident occur the coming season, these Canals, united with the Miami, will show a favorable account. The miserable manner the wooden locks were constructed, proved a constant source of annoyance to shippers, and loss to the State. By the indomitable perseverance of Mr. Forrer they were kept in navigable order, and are now in good condition.

Mr. Forrer gives very encouraging assurances of the truth of the above, as the extract annexed will show. He further adds that the amount of corn shipped from Toledo to Cleveland—one and a half millions of bushels—is about the same as the official report of the total received in Albany. The reduction of tolls for through freight tended materially to bring the carrying trade on this route, which another season will more fully develop.

"Flour has increased 40,333 barrels, pork 10,362 barrels, wheat 98,603 bushels, candles 39,918 lbs., tobacco 546,961 pounds, bacon and pork in bulk 1,054,810 pounds. The aggregate of lard, pork and bacon, in barrels and bulk, received at Toledo, amounts to twelve millions seven hundred and sixty-six thousand one hundred and ninety-one lbs., exhibiting an increase this year in the item of lard alone, of 3,015,168 pounds. Corn has increased from 30,037 bushels in 1845, to 1,135,946 bushels this year, showing an increase considerably exceeding a million of bushels. The amount of merchandise shipped on the Wabash and Erie Canal at Toledo, shows a total of 10,595,087 pounds, exceeding a trifle the amount shipped on the Ohio Canal."

There is one consideration necessary to be borne in mind. The collectors on the Canal, though appointed by the Board of Public Works, have nothing to do with it in their

account. They are in fact the Auditor's agents for the collection of the revenue, and accountable only to him—thus forming a salutary check. But still their salaries, overcharges, if any, are deducted from the amount received from the canal proceeds. This will explain any slight discrepancy in the Auditor's aggregates and that of the Board. I make this explanation as perhaps not generally known.

In my next the roads in charge of the Board of Public Works will be alluded to, as well as some matters connected with the lands donated to the State.

Statement of Length, Cost, Receipts, Deficits, etc., of the Ohio Canals, for 1846.

	Length, Miles.	Total Cost.	Cost per Mile.	Gross Receipts.	Net Receipts.	Interest or Cost of Each.	Deficit.
* Ohio Canal and Branches	337	4,965,203	13,932	346,339	266,986	281,712	14,743

Totals.....	821	\$15,268,964	Av. \$18,719	\$612,303	\$421,404	\$922,137	\$501,136

\* The Ohio Canal has 27 miles of Side Cuts and Feeders—to wit: Trenton feeder 3 miles, Walholding 14, Dresden Side Cut 24, Granville feeder 6, Columbus 12—which are included in the estimate.  
† This includes the Sidney Feeder, 13 miles, St. Mary's and Reservoir.  
‡ The Wabash and Erie has a Side Cut to Maumee, 2 miles, included in estimate, and one to Toledo of 1 mile, which was not observed until too late to be rectified.

The net proceeds fall a fraction short of three per cent. interest on the total cost. Interest estimated at six per cent., which would be about the average—first loan at five, the last at seven—balance at six.

#### Further Extracts from English Papers.

**Dublin and Holyhead Packets.**—The Dublin and Holyhead Railway Company are about to build four iron steam-packets, to run to and from Dublin, in conjunction with the railway. They are to be of first-rate designs, and in order to encourage competition, and secure good vessels, they have most liberally determined to offer a premium of £1000 to the builder of the boat which, in the course of 12 months, makes the quickest passages, with the smallest amount of repairs.

**Railway Calls.**—The amount of calls, payable on English Railway stock during January, amounts to £4,399,456; and on fo-

reign lines, £1,271,000, one-fourth or £317,750 of which, it is calculated, will be paid from England: making a total for the month of £4,717,206.

**Railway Traffic Returns.**—From these returns, it will be seen, that the amount of traffic for the last week, on nearly 2760 miles of railway, was £129,656, thus accounted for: £64,434 for the conveyance of passengers only, £37,287 for the carriage of goods, and a remainder of £27,844 for passengers and goods together, not respectively apportioned: being an increase over the corresponding week of last year of £13,494.

**Cornish Steam Engine.**—The number of pumping-engines reported for the month of November, is 24; the quantity of coals consumed being 1471 tons, lifting, in the aggregate, 14,000,000 tons of water 10 fathoms high; the average duty of the whole is, therefore, 53,000,000 lbs. lifted 1 foot high, by the consumption of a bushel of coal.

**New Locomotive Mechanism.**—A working model of a new plan of railway locomotion has been exhibited in London, with a view as stated, to the adoption of means for securing the great objects at which railway enterprise aims, namely, safety to human life, certainty of action, and economy in construction and working. By the new plan, the carriages are proposed to be built upon platforms which will glide on the peripheries of parallel lines of wheels, mounted on chains, stanchions or piles, rendering rails and bridges unnecessary. An immovable rope or chain forms a fulcrum, against which the motive power is to be applied. The rope or chain passes round a drum fixed on a travelling platform, the drum being set in motion by a small engine fixed on either side of it, on the platform, underneath which ribs, or flanges, about a foot in depth, make it difficult, if not impossible, for it to get off the wheels. The line of traction being invariably in the middle of the road, it is contended that no probable cause of accident can occur to disturb it, and that it will avoid the great danger incident to railways from the breaking of an axle, a wheel, or a rail, or from a sharp curve. An experimental road, of about a mile in length, is to be constructed near the metropolis.

#### Mr. George Stephenson's New Locomotive.

—We some months back mentioned, that Mr. George Stephenson, C. E., had invented a three cylinder engine, that is, one with two outside cylinders acting both together the same way and in the same place, and a third cylinder, with a crank in the middle of the axle, at right angles to the plane and crank pins of the two other cylinders. The middle cylinder is double the capacity of either of the other two. We understand that the compensation by this middle cylinder is so perfect that not the least wriggle takes place at the highest velocities. Its power is said to be such, that it starts off like an arrow from a bow. If this invention succeed, it will annihilate the last and final point contended for by Mr. Brunel as a merit of the broad gauge, that is, power. Far more pow-

er will be able to be thrown into the engine, than any road can well bear.

**Indian Railways.**—The following, we learn from the "Times," of Thursday, are the conditions upon which the Board of Control and the Directors of the East India Company have at length decided upon giving their sanction to the introduction of railway communication into British India.

1. The Direct Trunk, or East India line, is adopted.

2. This line (which connects Calcutta with the North-west Province) is to be constructed in sections.

3. The Government guarantee 4 per cent. to the Shareholders.

4. The amount guaranteed is fixed at £3,000,000 to commence with.

5. The section out of Calcutta to be first executed.

6. The guarantee to extend over 15 years.

7. The rates of payment to be made by the Government for transport of mails, troops, stores, etc., to be agreed upon hereafter.

8. The interest to be received either in India or in London, at the option of the Shareholders, as soon as £500,000 is paid into the India House.

9. The land to be obtained by the Government for the Railway Company.

10. Government to have the privilege of purchasing the railway, after 30 years from the date of its completion, at the then fair market value of the property.

11. No limitation is to be fixed to the profits of the Company, but the rates of charges are to be reduced when the returns admit of it.

12. It is also understood that no rates or tolls will be assessed upon the Railway Company, and that the import duties on the stock and materials for the railway will be remitted.

13. The Company to be incorporated by an Act of the Legislative Charter, as well as by Charter.

These terms show that the Indian Government are fully sensible of the great benefits which railways will confer on India, in military and commercial respects, and their readiness to hasten their introduction, by giving all the encouragement and assistance that they are able to afford. Certainly more liberal conditions railway promoters could scarcely expect.

**The Snow and the Rail.**—On Tuesday night, at six o'clock, the express train on the York and Newcastle Railway left Darlington, being about an hour and a half behind its usual time, having been detained by the depth of the snow. The road was heavy all the way, and an additional engine was put to at Belmont; but there was no stoppage caused by the snow till they reached Washington, which they did about eight o'clock. At Washington station the train stopped half an hour, and it being reported that the line was passable, it proceeded; but it had not gone more than half a mile when it was brought to a stand-still. The engine-men and stokers who were prepared with shovels, partially cleared away the snow which had drifted in

the path of the engines, and the steam was again put on. Another half mile was got over; but further progress was found to be impracticable. The snow drifted round the carriages with such rapidity, that in a very few minutes it was found impossible to move them either one way or the other, and the snow gathering around the engines, soon extinguished the fires, and rendered all attempts to self-extrication hopeless. In this dilemma what was to be done? Two gentlemen, second-class passengers, determined on walking onward through the snow; and away they went, steering in the direction of the telegraphic wires. As they have not been heard of since, it is probable they succeeded, after many difficulties, of course, in reaching their destination, wherever it was. One gentleman, returning from the hymeneal altar, having been married but a few days previously in London, and was bringing home his bride, suggested to his *cara sposa* the expediency of returning to Washington, where a comfortable bed might be found more convenient for repose than the interior of a railway carriage, and the suggestion having been approved, the adventurous pair essayed the difficult and dangerous task. There were other ladies in the train, which comprised fifteen passengers in all, including the two that had already departed, but none thought proper to imitate her example. Five gentlemen escorted the bride and bridegroom, leaving behind them in the train three ladies and three gentlemen, who remained there till noon on Wednesday, when they also repaired to Washington, under the guidance of the engine-drivers, leaving Donaldson, the guard of the train, alone. All parties reached Washington in safety, and found comfortable accommodation at the inn near the station, and at the village in its vicinity. This is, perhaps, the first instance on record of a railway train having been buried in the snow.—*Chronicle*.

**Eastern Counties vs. Eastern Union Railways.**—The Directors of the Eastern Union Railway have lately placed on their line second-class carriages of a greatly improved construction, and in which the comfort of the passengers has been studied in a manner worthy of imitation. They are enclosed with glass, and the seats are of stuffed leather, and they altogether approximate much nearer to the English elysian—Comfortable, than those in general use. But, unfortunately, the Eastern Union authority extends only sixteen miles of the sixty-six between Ipswich and London; and on Tuesday a peremptory order from the *magnates* of Shoreditch was received at the Colchester station that the new Eastern Union second-class carriages should not be suffered to proceed beyond Colchester. The passengers were accordingly obliged to resign their warm seats in the Ipswich carriages, and locate themselves in the Eastern Counties Railway tumbrels for the remainder of the journey.—*Essex Standard*.

[We shall feel obliged by the Eastern Counties authorities informing us whether the above is true. Ed. "H. R. J."]

**Good!**—Lord George Bentinck, at Hudson's festival at York, made so good a speech

on Railways, that it merits registration in our columns. He observed.

It has been said by the great Minister of France, that railways, next to the art of printing, have been the most powerful instruments that the ingenuity of man ever devised for the civilization of the world. And if my right hon. friend cannot claim for himself the invention which he has carried out, at least he can claim, more than any other man in the world, that he has carried that invention into practice. Who is there here that does not feel the advantage which the invention of George Stephenson, carried out by George Hudson, has produced? We all remember the state of distress that cast a gloom over the entire empire in 1839 and 1840. 40,000 able bodied laborers were in the workhouse, the revenue was falling off, and there were 1,500,000 paupers upon the poor rate. Railways were at a discount. My right hon. friend stepped forth, and set a noble example. He roused the talent and dormant energies of his countrymen—he urged them to action—and it is owing in the greatest degree to his exertions that railways have been since constructed, which are daily giving employment to 200,000 laborers, at wages averaging 22s. 6d. per week. Hence the prosperity of the last few years. But that is not all. We have heard to-day what the city of York has gained in the article of coals alone. We hear much of cheap justice at every man's door, but, I think, at this inclement season of the year, when winter has laid her frosty hand upon the earth, we must all feel that cheap fuel for the poor man's hearth is at present a far greater blessing than any other that can be conferred upon him; and it is to my right hon. friend that the poor of the city of York are indebted for the blessing. Where they once paid, as I have been told, 16s. 6d. per ton for their coals, before railways were established, they now pay 6s. 6d. The advantage also extends to the rich; and here we are to-day from London, having breakfasted there by daylight, and been brought in daylight too, for a less sum of money than a few years ago it would have cost us to have paid our post boys and turnpike tolls on the road. But then we are told that my hon. friend seeks nothing but his own profit. Why, who but the most niggardly minded men can do otherwise than rejoice at the splendid fortune he has achieved? Talk of commerce or enterprise without profit! Why, profit is the aliment—profit is the very breath of enterprise and commerce. Deny to commerce and enterprise her just profit, and few years will elapse before the enterprise of England will subside; and instead of being at the head we shall be at the tail of all the nations in the world. Most intimately allied, inseparably blended with the enterprise of my hon. friend is the great inventor who honors us with his presence to-day; one whose name will live in the pages of history, when the names of warriors and of kings; unless it is of him who stands beside me; shall have passed into oblivion. Not at this day only, but in all time to come, the name of George Stephenson will be remembered and honored. It will be

revered by him whose lot it is to labor, and who obtains his fuel cheap. It will be remembered by every farmer whose corn is carried to market for him at 4s. to 5s. per quarter less than before. It will be remembered by every merchant and every commercial man who profits by the invention of railways. It will be remembered by every country that has an army to be paid to keep the civil peace, for we have been told that railways have in this country made a little army do the work of a great one. I think, then, when we look at all these things, we must agree with the Minister of France, that the art of printing alone surpasses the invention of which George Stephenson is the great author. His lordship concluded by proposing the health of "George Stephenson, Esq."

**Forth and Clyde Canal.**—From the half yearly abstract statement of this company's affairs, says the North British Railway Journal, has just been issued, we observe the surplus revenue for the six months ending 30th September, amounted to . . . £26,539 12 7 and the previous balance on

hand to . . . . . 3,169 7 9

Leaving . . . . . £29,707 0 9 applicable for a dividend of £3 per share under reduction of income tax. After paying the dividend, the balance on hand is £2,174 0s. 4d., in addition to the sum of £9,910 6s. 11d. returned by the Edinburgh railway company, after the abstract statement had been made up. Regarding this sum, the report states, that "it ought not to be dealt with by the present meeting." The report then proceeds—"But it must be satisfactory to learn that there will be so considerable a surplus in hand, after paying the present increased dividend as to maintain the independent position of the company. The attention of the proprietors is called to the fact that, although the more prosperous state of the company's business is owing, among other things, to the amicable understanding entered into by the railway, a considerable portion of it has arisen from a more complete development of their own peculiar resources, which the council have at former times ventured to predict would take place, and which they venture to say will still further be extended—observations justified by the fact that the trade in the Forth and Clyde canal in the half year exceeds by 80,000 tons that of the same period of last year, and that it had increased from under 400,000 tons in the year 1837, to above 900,000 in 1845; and that in the present, it will exceed a million of tons."

**Railways and the Fishing Trade.**—A correspondent of the Newcastle Advertiser from North Sunderland says: "Scarcely any class begins to feel the benefit of railways more than fishermen do. The demand for fresh fish of all kinds has increased so much of late, that when on a visit the other day at Cullercoats, I was present when a merchant agreed to give 21s. per score for all the cod caught at that place during the winter." This is at least 300 per cent more than can be obtained by the fishermen of Wick for the same commodity.

**Passengers on the Blackwall Railway.**—In 1842, 2,200,000 passengers were carried, and in 1845, 3,200,000. In 1846 there will be, it is estimated, 3,500,000. On last Good Friday there were 10,000 people backwards and forwards to Gravesend. Four-fifths of the pleasure passenger traffic on this line are from the east of Waterloo bridge.

The Railway Chronicle, of December 26, says that, "From our official returns it appears that the amount of traffic for the last week, on upwards of 2760 miles of railway, was 131,141, thus accounted for: 66,054 for the conveyance of passengers only, 36,557 for the carriage of goods, and a remainder of 28,530 for passengers and goods together, not respectively apportioned; being an increase over the corresponding week of last year of 14,892."

The Stour Valley is to be leased to the Eastern Union and Bury St. Edmunds. The terms are 4½ per cent. on the capital to be expended, and a division of the profits after that sum.

Mr. Wyndham Harding, the secretary of the Buckinghamshire lines, has been presented by the Institution of Civil Engineers with the Telford Medal (of the first class) for his paper "On the Variation of the Resistances to Railway Trains at various Velocities."

Railways, while they are the ready means for the conveyance, are thought, anomalously enough, to be instrumental in the diminution of sheep, if we may believe Mr. Waddington, M.P., who, at the West Suffolk agricultural dinner, is reported to have said, "He was afraid that the sheep of the country were very fast diminishing. What was the reason for this diminution he could not make out, unless it was that many of the laborers were employed on the railroads at good wages, that they worked very hard, and required greater sustenance than formerly, and that they had caused an increased consumption of mutton."

**Compensations. Gt. Southern and Western, Ireland.**—The verdicts at the court of inquiry, held at Thurles, into the land owners' claims, seems to have produced the desired effects. Amicable settlements have been since rapidly accomplished. In the case of M. Carroll and J. Tracey, who claimed compensation in respect of 2 roods and 18 perches of tillage land, part of a farm which the claimants held as tenants in common, the amount claimed was 60, the sum offered by the company was 46; the jury found a verdict for 34. 8 9. The next case was that of P. Whelan, who claimed in respect of 1 acre 1 rood 20 perches; the sum demanded was 577, the sum offered by the company was 300; the jury found a verdict for 170.

It is estimated that on the yearly supply of the London market—150,000 beasts and 1,500,000 sheep, the saving by railway conveyance is 675,000.

Experiments to test the quantity of coal best adapted for steam purposes are now being carried on in the College of Civil Engineers, Putney.

The North British and Mr. Hudson are reported to have finally concluded their arrangements. Under the guarantee of 8 per cent with half profits, the North British is to pass under Mr. Hudson's management. The transaction will of course have to be submitted to the proprietaries on both sides.

**Cornish Engines.**—The number of pumping engines reported this month is 24. They have consumed 1,471 tons of coal, and lifted 14,000,000 tons of water 10 fathoms high. The average duty of the whole is therefore 53,000 lbs. lifted one foot high by the consumption of a bushel of coal.

## A REVOLVING RAILROAD GRIPER. A NEW INVENTION.

This invention consists in gripers or catches so connected as to form an endless chain, C and D, which is made to revolve around two wheels running in a line over the rail of railroads, in such a manner that the jaws of each griper, as they come down from over the wheel, will project down the sides of the rail, and fasten to and loosen therefrom as the car advances. Its object is to enable cars to advance or stop at all times, with certainty and safety, both upon level and inclined planes, whether the track be dry, or rendered slippery from any cause.

The grippers consist of two parallel bars E, each furnished with a jaw to project down the sides of the rail F, and connected together at their ends by right and left hand screws. The grippers are connected together by a bar G, having its ends attached to the middle of one of the screws in each. This bar turns the screws which work the jaws to and from the rail. The wheels A and B may be attached to engines and cars, and the motive power conveyed to them by any known means. They are destined to bring the grippers in contact with the rail, but not to support their own or the weight of the engine. The forward wheel should be smaller than the other, in order to give greater motion to the screws and jaws, and both be provided with a flange on each side to guide the chain. The surface of the wheels between the flanges may be made of a number of sides or faces, instead of a circle, in order to prevent the slipping of the wheels in the chain, each side being of the same length as the grippers. The

screws are cut with very oblique threads, in order to give sufficient motion to the jaws. The grippers are opened by the curving of the chain on the wheel, and closed by coming to a line on the rail: thus fastening them to the rail under the foremost wheel, and loosening them therefrom under the rear wheel by the falling and rising of the single link or bar as it comes from or rises to the wheel. The action of the grippers is the same, whether the car moves forward or backward, being placed by the wheel on the rail, and then fastened. As the rear wheel passes over them they are first loosened, then taken up, and carried over to seize the rail again.

This improvement has for its object the removal of the most serious difficulty met with in the use of railroads, viz: the want of sufficient adhesion between the locomotive and the rail to allow the use of the full power of the engine, thus restricting the construction and use of railroads to level plains. The simplicity of its construction and operation, the certainty of its hold upon the rail, both in propelling and stopping trains, and its perfect adaptation to the common locomotive and the T or H rail, strongly recommend its adoption upon railroads, and especially upon those not yet completed, where vast sums of money are necessary to be expended in procuring a level surface for the track. The inventors, Dr. R. F. Stephens and Mr. L. B. Pitcher, of Syracuse, N. Y., have recently obtained a patent for the invention, and are ready to grant rights to railroad companies or individuals—to those who will first adopt its use, upon very favorable terms.

Correspondents will oblige us by sending in their communications by Tuesday morning at latest.

### AMERICAN RAILROAD JOURNAL.

Published by D. K. MINOR, 105 Chestnut St., Philadelphia.

Saturday, February 6, 1847.

### INDEX FOR 1846.

The Title Page and Index for last years' volume were mailed with the last number of the Journal.

### Railroads at the East.

The Yankee Blade, in a late number, gives the following synopsis of the two main lines of railroad proposed eastward, from the city of Portland, Me., in regard to which much has been already said, through the New England press, upon both sides. The editor remarks that "the time is come for the extension of railroad communication to the valley of the Kennebec, is beyond doubt. That the travel and business is now sufficient to make investments in such a road profitable, is certain. But that more than one is required at present, or would be profitable if made now, is very questionable. It is of importance then that but one be attempted at present. What then should be the route adopted for that one?"

Two routes are presented for comparison; both commencing at Portland, and at three miles from that city, proceeding side by side to North Yarmouth, eleven miles. One then bends to the left, and runs by the way of Danville, Auburn, Lewiston, Greene, Leeds, Monmouth, Winthrop, Redfield and Belgrade to the Kennebec at Waterville.

The other inclines slightly at North Yarmouth to the right, and proceeds through Freeport, Brunswick, Topsham, Bowdoinham, Richmond, Gardiner, Hallowell, Augusta and Sidney, to Waterville.

The length of the upper, or Lewiston route, from the depot at Portland, is as follows:

To Danville, as per location of Atlantic and St. Lawrence railroad, is some over 29 miles—say .....	29 miles.
Danville to Lewiston, per Hall's "reconnoissance" .....	6 "
Thence to Sprague's brook, Greene .....	7 "
Thence to Monmouth Centre .....	5 1/2 "
Thence to Winthrop Village .....	5 1/2 "
Thence to Snow's Pond, Belgrade .....	12 1/2 "
Thence to West Waterville .....	9 "
Thence to Waterville .....	5 "

Total .....

The above distances from Danville to Waterville are taken from the report of Mr. Hall, the engineer, employed by the friends of this route. They are not actual admeasurements (no instrumental survey of the route having been made as yet) and are probably short of the actual distance in the aggregate.

The lower, or Augusta route, according to the report of the engineer, who, with a large corps was engaged in the survey more than two months, and

who vouches for its minute accuracy, is as follows: From Portland to Brunswick village .....

Thence through Gardiner village to the centre of Augusta village .....

Thence to Waterville (estimated) .....

Total .....

This route crosses the Androscoggin 1 1/4 mile from Brunswick. Another route was surveyed, crossing at the falls below Brunswick and Topsham, and joining the first in Richmond. By this route the distance from Portland to Augusta is but 56 1/2 miles, and to Waterville 75 1/2 miles. By adopting the longest route (58 to Augusta) the Androscoggin is crossed at the "narrows," which offers extraordinary facilities for bridging; and the branch from this point will be but 6 1-2 miles to Bath.

The shortest route is thus given, to Waterville, through Gardiner and Augusta. But in view of the question presented, viz: the reaching of the Kennebec from Portland, the matter of distance is in favor of the Augusta route; being by the Lewiston 79 1/2 miles; but touching the valley of the Kennebec at Bowdoinham in only 34 miles, and reaching the commercial heart at Gardiner, in 51 miles. But waiving this point, we will consider, for the purpose of this discussion, Waterville as the place to be reached; and it is settled by the surveys, that the Augusta route to Waterville is as short, if not shorter, than the Lewiston. But some may still doubt whether this be so, for it has become so much a habit in some quarters to speak of the route through Lewiston, as being "across to L," that people who do not examine for themselves, take it for granted, that if it be "across to L," it must be nearer than to go around by Augusta. Let such bend spread a map of the State before them, place one end of a rule upon Portland, or the point of separation in North Yarmouth, and the other upon Waterville, and they will find the straight line to run through Augusta and Hallowell villages; and that Brunswick is one-third nearer the line on one side, than Lewiston is on the other. In fine, it will be seen at a glance, that the Lewiston route bends much farther from the line than does the Augusta, and must of necessity, (unless much freer from curves) be longer than the latter. Whether it be likely to be freer from curves any one may judge upon reading the following extract from Mr. Hayward's report. After remarking that there are "42 miles of straight line," and nearly 10 of perfectly level, and that the remainder is in "grades from the most gentle to those of 39 1-2 feet to the mile," he goes on to say, that "there are very few railroads in New England—none of this length—whose grades and curves are of so unexceptionable a character. With the exception of a very few curves, and those at stations, where, of course, the trains will move slowly, there is nothing to prevent running this road at the rate of 30 to 35 miles per hour." "The gentleness of the grades adapts it to a heavy freighting business; and the directness of the line, its adaptation to a high speed in the trains consistent with safety and convenience, makes it a first class road." It may be proper to remark that Mr. Hayward, the gentleman employed to survey this road, has had great experience in his profession, and that his reputation for skill and judgment stands very high.

The next thing to be considered is, on the line of which route lies the greatest amount of existing population and business?

"On the Lewiston route, commencing at North Yarmouth (and excluding it and Waterville, as those towns are the assumed termini of each road) are the

towns named above, containing collectively a population of about 17,000, and three or four comparatively small business villages, containing in the aggregate perhaps sixty traders. It will be borne in mind, also, that these towns are among the oldest settled in this region, and that their population and business have not materially increased for twenty years.

"On the Augusta route, there is an aggregate population of 44,000; and, exclusive of four villages, each as important as any one on the Lewiston route, embracing five of the largest business towns in Maine, containing more than 500 retail traders and many wholesale merchants, and owning as many tons of shipping, probably, as any other five towns in the State. [Bath is included in the Augusta route, as it is virtually identified with it, being included in the Act of Incorporation, and by the provisions of the act, the branch to Bath is to be completed simultaneously with the completion of the road to Brunswick.] It may not be amiss to remark in illustration of this latter statement, that there have been built on the line of this route, and within five or six miles of it, during the present year, about 60 vessels, averaging nearly 250 tons each, and worth, in the aggregate, \$600,000. It is worthy of observation, also, that the towns on this line have increased their population, at least 10,000 within ten years. Again, were the Lewiston road built, none of the towns upon the proposed Augusta line, and but two or three lying between them, would ever use the road, but as a matter of course continue in the use of the existing modes of travel, until the exigencies of the case shall call into existence a railroad for their accommodation, which would doubtless occur in time.

"On the other hand, were the Augusta road made and the Lewiston not, one half the towns upon the route of the latter, all the intermediate towns, and a large portion of those westwardly of it, would resort to the Augusta one, as they would but be continuing their accustomed routine of business and travel.

"It will be seen, that in this comparison we have kept out of view all the population lying east of the Kennebec river, for no one can fail to perceive that the whole of it would be as well commoded by a road from Waterville, passing through Lewiston; and that three-fourths of it would be vastly more accommodated by the former.

"The question propounded for discussion, at the commencement of this article, must, in view of the foregoing incontrovertible facts, be answered in favor of the Augusta route. Many other facts having a bearing upon the subject might be adduced to the same purpose.

"In a future article, should we find time, and the ground be not previously occupied by an abler pen, we propose to resume the subject, and attempt to show that the business and local intercourse of the towns on the Kennebec river require that they should be connected by a band of iron, as they are now united by a community of interests; and adducing reasons why the great main trunk of railroad communication, for the whole State, should pass upon the Kennebec route."

✶ The Rochester Democrat says that, the companies from Utica to Auburn, contemplate reconstructing their track. To compete successfully with the great southern line, these roads will have to be rebuilt in a substantial manner. We hope there will be no difficulty in the way of running an express train through in the summer. The Utica company proposes to do so if the rest will follow the example.

**Dayton and Springfield Railroad.**

The Dayton Journal publishes the proceedings of a meeting held in that city on Monday evening.—Messrs. Beckle and Smith reported that they had an interview with the Board of Directors of the Mad River and Lake Erie railroad at Bellefontain, who expressed themselves anxious to aid the project of connecting Springfield with Dayton. They gave assurance that they would furnish the iron, estimated to cost \$60,000, if sufficient stock could be obtained to grade and prepare the way for the rails, say \$140,000. Messrs. Rench and Gebhard have been authorized by the Board to open books for subscriptions of stock in the Mad River and Lake Erie company, on the footing of the original stockholders. Messrs. Beckle and Smith have authority to procure the right of way, and another committee was raised to put the work under contract, as soon as the subscriptions of stock will warrant it. Engineers will survey the route in a few days, and estimate the cost. The road from Sandusky to Tiffin has yielded 12 per cent. on its cost. Springfield is looked to for a liberal subscription to this enterprise. Success attend our neighbors.

**Coal.**

Mr. LYELL, says the Philadelphia Ledger, states that Illinois contains more coal than all Europe.—The authority is as good as any on such a subject, for Mr. Lyell is a very enlightened geologist, and geology furnishes the means of ascertaining the constitution of any region. And whoever will examine the valley of the Mississippi with a geological eye, will say that it ought to contain coal in large quantities, and that the portions bounded by the lakes, the Mississippi and the Ohio ought to be especially fertile in that geological production. The whole State of Illinois must have been covered by the sea of which Lake Michigan is a remnant, and therefore must have received part of the forests torn by flood from the uplands. As the lake gradually receded, Illinois must have been left a marsh, subject to periodical inundations from the lake, the Mississippi and Ohio; and as such, it would receive the forests brought down the lake by these rivers, in these inundations. As the ocean is older than the lakes, so the great rivers must be older than the small; and therefore we take for granted that in the subsidence of waters from the great valley of the Mississippi, that river and the Ohio were the first perennial drains. As the waters continued to subside, all inequalities in the surface of the valley augmented, whether from drifts, deposits, or any other causes, the Wabash and Illinois became perennial drains; and thus the region of Illinois became bounded by one great reservoir, Lake Michigan and three great drains, the Wabash, Ohio, and Mississippi, with two other great drains, the Kaskaskia and Illinois, in the middle. All these continuing to rise and fall periodically, would convey and deposit on the adjoining regions large quantities of drift wood. And as ridges continued to rise between any two of these rivers, they would produce vegetation, which would be swept away by the periodical floods, and be deposited in the low lands by the tributary rivers, or carried by them to the great rivers, to be so deposited in their inundations. And after this periodical destruction of forests had ceased, the periodical inundations of all the streams, great and small, would overlay these ligneous deposits with earth, and thus produce the present region of Illinois, an alluvial soil deposited upon coal beds, and washed by great rivers. All the elements of carbonic formation have been applied to Illinois; and if such formation be not the result, then that re-

gion is an extraordinary exception from the operation of geological laws.

Then taking Mr. Lyell's opinion as correct, we see in this coal a wise provision of Providence, and an abundant source of wealth to that State and the nation. It will be not only a substitute for wood, so deficient in that State, as ordinary fuel, but a substitute for water power, also deficient in that campaign State, in every species of manufacturing, and in steam navigation. The time is not distant when even the immense forests of the Mississippi valley will fail to supply its numerous and increasing steamboats. Then what an abundant source of public convenience and state wealth will be found in these coal beds? And if the great State of Illinois, with its 55,000 square miles, its fertile lands, its navigable rivers, and immense agricultural wealth, also possesses inexhaustible coal beds for itself and the southwestern states, who can doubt its ultimate ability to pay its debts?

**Coal Trade.**

It is stated that the first coal of consequence dug from the mines in Pennsylvania, was in 1820, when 365 tons were sent to market. The increase of the trade since that time has been regular, though very large. The amount sent to market in 1846, previous to November 1st was 2,312,54 tons. The cargo price averaged the last year in Boston, from 25 to 37 cents higher than for the last four years.—Contracts, we understand, have been made, for the coming season for coal in Philadelphia, at the same rate as last year, which, with a probable additional freight, will make the cost of coal here higher than last season.

**Water Works of New Orleans.**

We learn from the New York Herald that the President of the Water Works of the Commercial bank of New Orleans, has made a contract with the Allaire Association of New York, for an engine and hydraulic machinery, to be capable of raising six millions of gallons of water every twenty-four hours. This will, says the Herald, be the largest of the kind in the United States.

**St. Lawrence and Atlantic Terminus.**

The following article, which appeared in a late number of the Portland Argus, emanates, we have reason to believe, from authority—and the facts contained therein may be relied on as correct.

**Terminus and Depot of the Atlantic and St. Lawrence Railroad at Portland.**—The centre line of the road, as it enters the city, runs from the curve round Fish point, on a straight line two thousand eight hundred feet to the northeasterly corner of India wharf, and thence onward in the same straight line to Andrews' or steamboat wharf on the south side of India street. The road is located six rods wide. The shore line of it, after leaving Fish point, lies below low water mark. On the water side of the road, for more than a quarter of a mile in length, vessels drawing 20 feet of water can lie and load. This location carries out the views of the Canadian as well as of the Maine company. Considering that the road is intended principally as a freight road, it combines advantages that the location of no other terminus and depot either in Boston or New England can claim.

1st. Passengers will be landed from the cars at the foot of India street, one of the widest in the city, and in the immediate vicinity of the steamboats and propellers and of

our hotels and boarding houses. Nearly one-half of the passengers that now come to Portland by stages, bound to New York and Boston, in summer take passage by the steamers in preference to the cars. Many also arrive from Boston and elsewhere by the steamers and propellers, bound east and north. To those passengers whose business or destination requires them to stop in the city, or to come or go by the steamers, the accommodations will be everything that can be desired.

2d. But the unquestionable advantage which this location possesses over all others in New England, is the facilities it offers, for the reception, lading, shipment and transshipment of freight. It is well known to every man, whose residence and business have led him to a practical knowledge of the subject, that under ordinary circumstances railroads cannot compete successfully with steamboats, propellers, and in cases of heavy and bulky articles, not even with sailing vessels in the transportation of freight. Most of the flour brought to this place comes by way of New York, and none of it, not even that from Boston, by railroad. Not one ton in two hundred of the freight which passes yearly between this city and Boston, is carried by railroad.

Assuming then as a fact, that in the matter of the transportation of freight, railroads cannot successfully compete with water borne craft, when that craft can move freely without obstruction, or detention, and directly to its port of destination, the superior advantage of this terminus and depot are manifest. The freight brought by the road from the interior comes directly along side of the vessel or steamer that is to receive it: not to be impounded here, as some have represented, nor to be taxed with cartage, truckage and wharfage, as in all other places, but to be transferred, by proper mechanical contrivances, directly from the cars on board the vessel. From the wharf in Portland it will be transported by the cheapest possible conveyance to its place of destination, whether it be Boston, New York, the West Indies, an Eastern, a Western, or an European port. The owner of the freight has therefore afforded him—not a single and limited market, not a nominal but a real choice of markets, with the best and cheapest channel for getting to it. It may be safely assumed that nine-tenths in value, and ninety-nine-hundredths in weight and bulk of the articles transported over the road, if of any comparative value at home, could not bear the tax of a moderate freight over an ordinary railroad of some two or three hundred miles; and yet would pay, and pay handsomely, if the expense were reduced one-half. In the transportation and transshipment of articles such as these, it becomes a matter of the first importance, both to the producer and consumer, to study the means of economizing the expenditure. It is with a view to the wants, not of a comparatively small number, but of the great public, the producing and business-doing public, that the road has been located, and the terminus fixed where it is; and it is with the same view that even the gauge, which gives so much

trouble to some of our friends, and excites so much clamor and intrigue elsewhere, has been adopted by the directors. The same remarks which apply to the facilities of transporting merchandize to Portland, for the purpose of exportation, are equally applicable to the facilities afforded for the introduction and transportation of articles for the supply of the interior.

Add to these advantages another not less striking—a steamer, bound to sea, might ordinarily in *fifteen minutes* after leaving the side of the railroad, be on the broad Atlantic ocean, on her way to her port of destination. And this, too, without the aid or the charge of a pilot.

#### Columbus and Lake Erie Railroad.

The editor of the Sandusky Clarion publishes the following communication in his last paper, which shows that the railroad improvements in that region are "quietly but surely advancing." The editor says the information comes from a source in which the fullest reliance may be placed.

#### Editors of the Sandusky Clarion;

Gentlemen—A meeting of the Directors for the Columbus and Lake Erie railroad company, was holden yesterday at this place. The object of the meeting was to receive a delegation from Newark, and their proposals for subscribing to the capital stock of the company or otherwise to induce an extension from this to that place. The result of meeting this delegation, together with others from important towns along the line, has been such that entire confidence is now established in the rapid completion of something over 50 miles of the road. The enterprising citizens of Licking county, readily perceive the great advantages of a railroad communication with Lake Erie, where the distance is but one-half the length of the Ohio canal from Newark to Cleveland. To secure these advantages, they have shown a liberality equal to the importance of the object. Subscriptions to the capital stock of the company are secured sufficient to warrant letting of contracts embracing so much of the line to Columbus, as lies between Mansfield, Newark and Granville. Engineers will immediately locate that part of the line not previously located, and prepare for commencing operations strong handed.

Of the importance of this enterprize to your citizens, there can be no diversity of opinion. The proper officers of the two companies have entered into a perpetual contract for running the two roads in connection, determining first the width of the track, and securing to the M. and S. C. railroad company the delivery of all article of transport destined for the lake. The contract contemplates running the two roads with the same machinery, defining the rights of parties, and division of earnings and expenses.

It has been remarked by those best acquainted with the results of railroad improvements, that no preestimate has equalled their business or earnings. If this has been their experience, and in view of this, capitalists engage in building such a line of road as the one now being built across the barren region from Ogdensburg to Lake Champlain, how

much more should they be encouraged who have in hand the interest of one hundred miles of road, traversing the richest products of agricultural labor and return freights of merchandize, which will constitute the great bulk of transportation. It is confidently believed by those who live in the vicinity of the Hocking mines and other coal regions adjacent to the line of C. and L. E. railroad, that bituminous coal will constitute the chief article of transport over the road to Lake Erie, making your town the great coal yard for the rich mineral regions of the north, and the country bordering upon the lakes. Be this as it may, there are other and ample assurances of large and remunerating profits to stockholders for the transportation of passengers and the produce of the country.

The extension of a line of railroad from the lake to Newark, so soon to be completed, is a matter of congratulation and great satisfaction to those who have had the enterprize in hand, and especially so, when considered as having triumphed upon its own merits, over rival improvements now begging legislative aid to inveigle foreign capitalists into measures for promoting local interests.

Respectfully,

Mansfield, January 22d, 1847.

#### Belgian Railways.

We have just received the annual report of the Belgian Minister of Public Works—M. A. De Bavay—for 1845. It is very voluminous, and contains 520 pages of tables. It appears that during 1845 that 4,968,052.08 fr. (£198,722) was expended on the railways. The total sum expended in the construction of the 348 miles of railway up to the 31st Dec. 1845, was 149,714,827.14 fr. (£5,988,592), being at the rate of £11,404 per mile. There are 225 miles of double line, and 123 miles of single line. The double lines are Brussels and Antwerp 46 kil. Malines and Gand 57 kil., Ostend and Plassehendael 6 kil., Courtray and the frontier 15 kil., Molines and the frontier of Prussia 133 kil., Brussels and the frontier of France 82 kil., Brain-le-Comte and Goderville 14 kil., Goselias and Charleroy 9 kil.; total, 362 kil.—The single lines are Gand to Plassehendael 60 kil., Gand to Courtenay 44 kil., Mouscron to Torney 19 kil. Landen to St. Trond 10 kil., Godarville to Gosselias 21 kil., Charleroy to Namur 37 kil., Branch at Antwerp 3 kil., and branch at Brussels 3 kil.; total, 197 kil. In 1845 they had 3 new engines with cylinders of 15, 14, 13 inches diameter respectively, 63 new passenger carriages, 292 goods wagons, and 20 other wagons.—So that on the 1st Jan. 1846, the working stock consisted of 149 locomotives, 145 tenders, 684 passenger carriages, 2,200 goods wagons, and 400 other wagons. In March, 1845, orders were given to construct three carriages, such as the one constructed in 1844 on the American system, capable of holding 84 persons, differing, however, from the American plan, by introducing 1st, 2d, and 3d class passengers in the same carriage, (the Americans have only one class) which the report says was found to be a very economical and satisfactory carriage. The fol-

lowing table shows the working expenses, the length of line opened, the number of leagues (3 1-8 miles) run and the cost per league train.

	Total working expenses.	Length of line open.	Tot. No. of leag's run.	Cost per mile pr train.	Exp'ns per leag's pr mile.
	Francs.	Leagues.	Leag's.	Francs.	s. d.
1841	4,339,659.17	674	289,726	15.67	4 2
1842	4,700,327.08	794	317,818	14.79	3 11
1843	5,476,615.72	964	375,334	14.59	3 10
1844	5,765,430.80	111 8-10	497,061	11.60	3 1
1845	6,321,575.48	111 8-10	545,302	11.59	3 1

The increase and diminution in the expense per train per league depends upon several circumstances. The number of trains per day, the number of carriages per train, the number of passengers per train and the speed at which the trains travel. The average number of carriages per train in 1844 was 10.5, while in 1845, it amounted to 14.5; the cost per league per train in the former case was 11.60fr., and in the latter but 11.59 fr. The consumption of coke per league per train was in 1844, 57.61 kil. (126½ lbs.) and in 1845, 57.17 kil. (128 lbs.) This anomaly is explained by the encouragement given to the engine drivers, stokers, and storekeepers to economise the coke. The former are allowed 25 cents, and the latter 6½ cents: total 31½ cents for each hectolitre (77 lbs.) of coke saved on the amount allowed, which was at the rate of 4 kil. per carriage in a train per league. The amount of coke saved by this means on the quantity allowed, during 1845, was 4,006,310 kil. (3,934 tons,) which at the price of 23.78fr. per 1,000 kil. (nearly 1 ton) amounted to 95,270.05fr.; deduct from this sum 35,770.84fr. (£1,430) paid to stokers, etc., as commission for saving the coke, which leaves a net saving of 59,499.21fr. (2,379) in favor of the state on the quantities usually allowed for the locomotives. The number of passengers carried in 1845:—1st class, 397,608; 2d class, 970,662; 3d class, 2,074,796: total, 3,443,066; soldiers, 10,939; extra persons, 16,673: 27,612: total number carried, 3,470,678; ditto in 1844, 3,381,529; increase 89,144 passengers. The number of passengers carried in September was 13,458; while that in February was but 6,483. The average weight of the luggage of each passenger, in 1845, was 3.21 kil. (7.06 lbs.) and in 1844, 3.12 kil. (6.86 lbs. In 1845, 6,455,501,664 kil. of merchandize (633,976 tons) was carried; and in 1844, 520,422,667; increase, 125,078,987 kil., or more than 24 per cent. The receipts for passengers, in 1845, were 6,393,309.20fr.; and, in 1844, 6,166,548.94fr.; increase, 226,760.26fr., or about 4 per cent. For goods in 1845, 4,175,593.41fr.; in 1844, 3,323,013.90fr.; increase 852,569.51, or 26 per cent. The total receipts for 1845, amount to 12,403,204.55fr. (£496,128) or £1,426 per mile per annum; in 1844, the rate was £1,291; increase 10½ per cent. The international traffic with Germany amounted to 12½ per cent., and that with France to 8½ per cent., of the total receipts. It is also interesting to know that the working expenses in 1844 were 51.33 per cent. of the receipts, while the dividend on the capital expended was equal to 3.69 per

cent.; 1845, the working expenses were 60.94 per cent., and the dividend on the capital equal to 4.16 per cent. The latter would have amounted to 4.39 per cent. had the carriage of provisions, etc., been taken into account, which were carried gratuitously on the railways for the public benefit.

*Comparison of the Receipts and Working Expenses per league from 1841 to 1845, inclusive.*

Year	Total receipts	Tot. work- ing exp's	Lang. ope'd.	Repts pr. league.	Ex. per league.	Pro't pr league.
	Francs.	Francs.	Lgs.	Francs.	Fr.	Fr.
1841	6,126,343	4,539,659	67.7	91,902	67,006	24,896
1842	7,461,553	4,700,327	79.3	94,212	59,348	34,864
1843	9,641,269	5,476,616	96.5	93,692	56,752	36,930
1844	11,930,493	5,765,431	111.8	100,452	51,569	48,833
1845	12,403,205	6,321,576	111.8	110,941	56,444	54,398

**Railways in India.**

From the Overland Delhi Gazette, October 19.

**Railway Traffic.**—We have been favored with a detailed table, published in the Delhi Gazette, giving the actual traffic on the grand trunk road, near Cawnpore. The results are briefly, a daily average for the month of September, of:

- 67.2 Hackeries, laden and unladen.
- 13.8 Camels, do do.
- 14.2 Bullocks and ponies, ditto.
- 9.4 Coolies and Banghies, ditto.
- 1.3 Carriages.
- 15.9 Native Bailies.
- 1.2 Palkees.
- 0.4 Elephants.
- 1.1 Doolees.
- 94.0 Horses.

1,022.2 Foot passengers:

There is, perhaps, no country in the world with any pretence to civilization, in which there is such an immense mass of unproductive labor, as in India, and stranger still to say, in that species of labor, the carrying trade, if we may so term it, which above all others, entails a constantly recurring expense. Out of 4032 hackeries which passed over the Cawnpore Trunk Road, from the 1st to the 30th of September, inclusive, 3228 were laden, and 804, or one-fifth of the whole number, unladen. We could scarcely have selected a more striking instance in proof of our hypothesis. The fact itself is sufficiently illustrative of the carrying trade, and of the expense of carriage generally—for the unproductive labor must somehow be paid for, and what process so simple, we do not say so expedient, as that which compels the owner of goods to pay at the rate of one-and-a-half tons of goods for every ton thus carried; and yet such is the system in practice generally, in India, and such it perhaps must necessarily be with such lumbering and crazy conveyances as we see daily passing before us. The same remark applies, and perhaps with still greater accuracy, to the transit of smaller parcels as effected by coolies and banghies. The proportion of unproductive labor must be in this instance still lamentably greater, and serves to show how backward this country is in its several and even in its peculiar modes of transit.

With these preliminary remarks we may proceed to examine the valuable registry of

traffic already noticed, at the same time promising that such information as we may glean from the statistical details of one month must necessarily be very imperfect, and more especially when that month happens to be, as in the present instance, the most unfavorable month for traffic in the year. Our acquaintance, moreover, with that particular district is not sufficiently intimate as to enable us to draw any definite conclusion, from the traffic on any one particular line of the road, as that from east to west, as to what it may be also from north to south. Taking the usual loads as undermentioned, for a four-bullock hackery, 20 maunds; an elephant, 20; camel, 6; bullock, 2½; pony, 1½; coolie, ½; and, making due allowance for such conveyances as passed unladen, we find, with that safe proviso, errors excepted, that the average daily amount of goods exceeded in weight 43 tons. On the principles that money makes money, and that railways create traffic, this amount would be considerably increased, and there would be, supposing the charge not very exorbitant, at least 60 tons of goods available for despatch daily, and as the average weight of a Manchester and Liverpool train is, if we recollect rightly, about 47 tons, there would be a sufficient supply, under any circumstance, for a daily train up and down in one isolated district.

The average cost for conveyances of goods by land carriage in India may be estimated at 30 rupees per ton (27½ maunds) every 100 miles. By a railway at the ordinary rate of 2.88 pence per ton per mile, at the average velocity, it would be 13 rupees per ton per 100 miles. Here then there would be an actual saving, in the mere cost of conveyance, of nearly 200 per cent., and this saving, in addition to the other unnumbered advantages which increased speed affords, would act more powerfully to bring into action the productive resources of India than any legislative enactment or any system of bolstering privileges whatever. In the registry of traffic on which these remarks are founded, are not included, we have reason to infer, any return of Government stores, which are constantly passing through the country. These latter, we understand, except in time of war or when there is any unusual emergency, are forwarded by river transit, when such is available, and must, therefore, have been overlooked when the statement of traffic was being prepared. But as the railway companies may reckon with every confidence on the employment which Government can furnish, we have only to add the amount of those stores to the general traffic of the country, and we shall form by no means a disheartening estimate of the amount of goods available for transit.

It would be difficult, or perhaps next to impossible, to form even any approximate guess of the number of travellers who could afford to pay the fare, however low it may be, for railway travelling. The table under consideration furnishes us with a sufficiently distinct view of the number of travellers on that particular road. The total is somewhat startling; more than 1200 are daily passing

on that road, and yet how few of these could afford to pay even at the rate of a pice per mile. The number passing daily in carriages and native conveyances, palkees and doolies, at the lowest average, exceeds 48, and of these perhaps 20 could afford to pay for a seat in a train. The number passing on horses and ponies is placed at 94, and of these perhaps a fifth part would give up the horse for the rail. We have at this rate, without including any from the foot-passenger class, about 35 travellers daily like to avail themselves of the accommodation thus offered. If the charge for third class passengers be sufficiently low, something slightly in excess of that charged for goods, we might multiply this number by tens, and give the result as the daily average amount of railway passengers. We have to add to this the charge for conveyance of the mails and Government servants, and shall even then form a very inadequate idea of the extent of travelling which railways would create. We have only to multiply these results by ten—perhaps by a hundred—in order to gain a more correct estimate of the amount of traffic in a single section of the country. The railway system, like the human frame, is wonderful and complex in all its parts; and if the system be healthy, all its movements are regulated with unerring precision. As it is impossible to guess from the infant in arms whether he may turn out eventually a giant or a pigmy in stature and strength, so it is impossible to guess, especially under circumstances so novel, and in such an immense breadth of country, whether a railway can even here possibly present those gigantic combinations which elsewhere it has confessedly displayed. A railway may be easily projected, and as far as the difficulties of engineering are concerned, as easily made; but it can only thrive by unremitting vigilance on the part of its conductors, and by the line having been so judiciously selected as to embrace the requirements of the country, and to unite its main arteries. A railway, so we are told, now connects the Falls of Niagara with the remotest parts of Albany, and what was formerly a fatiguing tour of many weeks, may now be passed over with ease at the rate of 16 miles an hour. Cities containing a population of 20,000 souls, now occupy sites on which, about twenty-five years ago, log-cabins were constructed. The extremes of civilization may be there said to meet, for groups of Indians, lately the unprofitable owners of the broad lands around, assemble to offer for sale at the various station-houses their simple trinkets, and gaze at the ponderous machine as it rushes forward to its destination. And why may not the same results be anticipated in a country like India, in which everything is in an infinitely higher state of advancement, and which has enjoyed in such an eminent degree, so long an interval of rest and security? The Report of the Railway Directors proves, if any proofs are required, the feasibility of railways. The registry of traffic, on which we have commented, proves likewise that there is a sufficiency of goods for transit, and thus has the first

pebble been thrown, which, in due time, by the zeal of the passers by, will be converted into a mountain.

#### Reading Railroad Report for 1846.

We have received a copy of the annual report of this company. It is full and explicit, giving full details in the different departments. The amount of coal brought down was not quite equal to the estimate in the last annual report—owing to the severe "freshest in May, and the great falling off in demand for coal in August and September," but the receipts for the year were greater than the estimate.

We only give, this week, the report of the President, JOHN TUCKER, Esq., as it came to hand at a late hour, when the Journal was nearly ready for the press—but the next number will contain the remainder, with all the details. By referring to the last year's report—see RR. J. page 171—it will be seen on reading this, that there has been a large increase of power and ability to meet the demands of the public; and we may anticipate for the company a considerable increase of business the ensuing year. We shall, in our next, refer more at length to the subject.

#### Report of the President and Managers of the Philadelphia and Reading Railroad Company to the Stockholders, January 12, 1847.

#### To the Stockholders of the Philadelphia and Reading Railroad Company.

The Managers have the pleasure of stating that the profits derived from the business for the year ending November 30th, 1846, are even greater than they predicted at your last meeting.

They can also state, that there is still the same desire to secure the facilities which the company possess for the transportation of coal, as existed at the close of the previous year.

A table of the anthracite coal trade (prepared by the Philadelphia Commercial List) for the year, is appended. It shows an increase in the consumption over that of the last year, of 207,626 tons, of which 153,159 tons have been furnished from the Schuylkill region.

The usual statement of the Treasurer, showing the financial position of the company, is herewith submitted. Also an account of the profits resulting from the business.

It will be observed that the net revenue for the year is \$1,037,795 21, showing an increase over that of the former year of \$530,490 22.

The expenditures for new machinery and for necessary and consequent permanent improvements, are fully explained in the accompanying statements, with the exception of the following items, viz:

Railroad iron for 8½ miles new track, sidings, etc.....	\$50,087 05
Land damages, and settlement of claims previously adjusted, strictly appertaining to the business of previous years and the cost of the road.....	28,769 68

\$78,856 73

The disbursements for other purposes are given in such minute detail in the reports annexed, that further allusion to them here is deemed unnecessary.

The increase in the receipts over those of last year, from

The transportation of coal is.	713,728 00 or	80 p. c.
" " merchandise	76,995 78 or	127 p. c.
" " passengers	38,337 94 or	37 p. c.

\$829,061 72

The managers regard this result, as showing conclusively the propriety of the expenditure by which it was produced.

During the ensuing year, it is not the intention of the Managers to increase the quantity of machinery further than to obtain the four locomotive engines authorized at the last meeting, which were then ordered, but have not been received by the company, in consequence of a departure from the terms of the contract.

The policy of gradually changing the wooden bridges into stone or iron, as they require extensive repairs, will be continued. The propriety of this course cannot be doubted, as the saving when thus changed is vastly more than the interest on the increased cost. They are now in such good condition that it is not, at present, proposed to alter many of them.

The expenditures will, therefore, be small during the ensuing year.

The Managers for the first time, have now the pleasure of calling your attention to the subject of a dividend.

The profit and loss account of the year results as follows, viz:

Gross receipts from all sources.....	1,900,115 35
Deduct all expenses.....	862,320 14
" Interest.....	571,119 93
" Taxes, etc.....	16,380 19
" Commissions & charges.....	43,672 61
" Sundries.....	4,330 19

1,497,823 06

Balance applicable to a dividend fund, or upwards of 12½ per cent.....	\$402,293 29
--	--------------

If the proprietors had taken Stock at par as contemplated by the charter, to provide funds for the payments for the new machinery, which you directed should be obtained at the last meeting, and for other consequent improvements, this fund would now be in the hands of the treasurer.

But as no such provision was made, the revenue has been applied towards the payments for this new property, and a dividend in money is therefore impracticable.

Under these circumstances, the question of the propriety of a dividend in shares, has had the serious consideration of the managers, but as they do not feel themselves authorized to create new stock, without your sanction, they refer this subject to you and ask for your instructions.

While the debt remains so large, the managers urge upon you the importance of adopting at present, and for the future, such permanent course in reference to the subject of dividends, as will give the company (to the extent of its profits) the means to pay the bonds as they mature, or insure the conversion of the debt into stock.

The policy of making dividends in stock, insures a gradual decrease of the debt. This course is subject to no well founded objection, and is common elsewhere with the most prosperous institutions.

The profits are thus reserved for the diminution of the debt, or for the acquisition of

new property to increase the revenue, and thus each successive year the company is placed in a more independent and prosperous position.

By the adoption of this system, the stockholder may confidently expect to receive more than the bondholder, while the latter cannot but approve of the measure, as the profits are applied to the liquidation of the debt, or to increase the property of the company, by which the security of the creditor is enhanced.

With these views, the whole matter is submitted, as one peculiarly within your province for decision.

The managers think it not improper to remind you of the accuracy of the estimate made a year since, of the business and profits. The period, for which the estimate was made, was from January 1st to December 31st, 1846.

The tonnage (Coal and Merchandise) transported during that year, differs only..... 27,566 Tons.

Through passengers for same time... 8,061

Profits or revenue from the business from Dec. 1, 1845, to Nov. 30, 1846, \$49,775 21

(The profits for December, 1846, not yet made up.)

In each item, the anticipations then expressed, have been exceeded.

The Managers feel that the permanent prosperity of the company is fully established. Their past Predictions of the capacity of the coal machinery and of the cost of transporting that fuel to market, have been fully confirmed, and they deem it unnecessary for them to give any detailed estimate of the future business, farther than to express their confident belief, that the report of the ensuing year will not be less than that they now present.

By order of the Board of Managers,  
JOHN TUCKER, President.

Office of the Philadelphia and Reading Railroad Company, Philad., January 8th, 1847.

President.—JOHN TUCKER.

Managers.—Charles H. Fisher, Samuel Norris, John Towne, William R. Lejee, Christopher Loesser, of Orwigsburg, Mathias S. Richards, of Reading.

Secretary and Treasurer.—Samuel Bradford.

(To be Continued.)

The turnpike tolls from Pelham-lane gate to Deptford Hill and Bromley Common gates which were last year let for the sum of 12,530£, have just been taken for 11,470£.

The Northern of France have introduced heaters of hot water into the first class carriages.

Cape Cod Branch Railroad.—It has been repeatedly stated that the stock of this road had been all subscribed. This is a mistake; \$100,000 are now wanting; but we are assured that it will soon be all taken up. The following sums were last week subscribed by three gentlemen in Boston, of Cape Cod origin: \$10,000, \$6,000, \$4,000.

Railroad Stockholders under Laws of Vermont.—The court in Vermont has given an opinion in favor of the Vermont Central railroad company, in the case of said corporation

against one of their delinquent stockholders. We believe this is the first case which has been decided in the state of Vermont as to the liabilities of railroad stockholders.

**Perpetual Motion.**—The Hartford Times says that a machine is now on exhibition in that city, which is claimed to be capable of producing perpetual motion. It is running now, and will be during the continuance of the fair. It is an ingenious contrivance, truly, and may lead to useful improvements in machinery, if it does not prove capable, in itself, of driving powerful machinery; and its owners claim this merit for it. The motion (turning of a wheel) is procured by a spring, similar to that of a watch, and the continued winding up is performed by the expansion and contraction of fluid, (oil is used, though quicksilver is undoubtedly preferable) confined, as in a thermometer, at the base of a rod upon which it acts as the change in the temperature of the atmosphere expands or contracts it. By an ingenious contrivance the revolving axle is made to turn the same way, whether the tendency of the fluid be up or down. The capacity of the machine now on exhibition is sufficient to raise 400 pounds, and the slightest variation from heat to cold acts upon the "winding up" part of the machine. The proprietors says a clock was attached to one of these machines about two years since, and it has kept it wound up, so that it has run constantly to this time. It is the invention of Col. Boon, of Ohio, who has spent a life and a fortune upon it.

**RAILWAY IRON.—THE BEST QUALITY** of English Heavy H Rails—60 lbs. to the yard—now in store, landing from the vessel, and on ship board to arrive, for sale on most favorable terms by  
**DAVIS, BROOKS & CO.,**  
Jan. 2. [11f] 68 Broad St., New York.

**BACK VOLUMES OF THE RAILROAD JOURNAL** for sale at the office, No. 105 Chestnut street.

**RAY'S EQUALIZING RAILWAY TRUCK.—THE SUBSCRIBER** having recently formed a business connection in the City of New

York, expressly for the manufacture of the newly patented and highly approved Railroad Truck of Mr. Fowler M. Ray, is ready to receive orders for building the same, from Railroad Companies and Car Builders in the United States, and elsewhere.

The above Truck has now been in use from one to two years on several roads a sufficient length of time to test its durability, and other good qualities, and to satisfy those who have used it, as may be seen by reference to the certificates which follow this notice.

There have been several improvements lately introduced upon the Truck, such as additional springs in the bolster of passenger cars, making them delightful riding cars—adapting it to tenders, trucks forward of the locomotive, and freight cars, which, with its original good qualities, make it in all respects the most desirable truck now offered to the public.

Orders for the above, will, for the present, be executed at the New York Screw Mill, corner 33d street and 3d avenue, (late P. Cooper's rolling mills) and at the Steam Engine Shop of T. F. Secor & Co., foot of 9th street, East

**LOCOMOTIVE AND CAR AXLES.**  
The Subscribers are now prepared to receive orders for the well known and approved *Reading Locomotive and Car Axles*—drawn to any required pattern from *Bloom Iron only*. Address  
**SAM'L KIMBER & CO.,**  
Willow Street Wharf,  
Philadelphia, Pa.

**NOTICE TO RAILROAD CONTRACTORS.**  
Proposals will be received at the Office of the Boston and Maine Railroad, No. 60 State street, Boston, until Monday, the 8th day of February next, for the Graduation and Masonry on the line of Road in Andover, between the Merrimack River and a point of intersection with the old Road.  
For examination of profile and work, application may be made at the office of the Engineers, at the Depot in South Andover.

**THOMAS WEST, President**  
Boston and Maine Railroad.  
January 22, 1847. 314

**NOTICE TO RAILROAD CONTRACTORS.**  
Proposals will be received by the Subscriber, at the office of the Michigan Central Railroad Company, at Detroit, until the 16th day of February next, for Grading the first thirteen miles of the Extension of the Michigan Central Railroad, from Kalamazoo, westward; said thirteen miles contains about four hundred thousand cubic yards of earth work. Plans and Specifications will be ready for examination at the office of the subscriber after February 1st.  
**J. W. BROOKS, Supt. & Eng.**  
Detroit, January 5, 1847. 513

**A. & G. HALSTON & CO., NO. 4**  
South Front St., Philadelphia, Pa.  
Have now on hand, for sale, Railroad Iron, viz: 180 tons  $2\frac{1}{2}$  x  $\frac{1}{2}$  inch Flat Punched Rails, 90 ft. long. 25 "  $2\frac{1}{2}$  x  $\frac{1}{2}$  " Flange Iron Rails. 75 "  $1\frac{1}{2}$  x  $\frac{1}{2}$  " Flat Punched Bars for Drafts in Mines. A full assortment of Railroad Spikes, Boat and Ship Spikes. They are prepared to execute orders for every description of Railroad Iron and Fixtures. 11f

**RAILROAD IRON.—THE NEW JERSEY** Iron Company, Boonton, N. J., are now preparing to make Railroad Bars, and are ready to take orders or make contracts for Rails, deliverable after the first of December next. Apply to  
**FULLER & BROWN, Agent.**  
No. 139 Greenwich, corner of Cedar street.  
September 18, 1846. 10:39

**NICOLL'S PATENT SAFETY SWITCH** for Railroad Turnouts. This invention, for some time in successful operation on one of the principal railroads in the country, effectually prevents engines and their trains from running off the track at a switch, left wrong by accident or design. It acts independently of the main track rails, being laid down, or removed, without cutting or displacing them.

It is never touched by passing trains, except when in use, preventing their running off the track. It is simple in its construction and operation, requiring only two Castings and two Rails; the latter, even much worn or used, not objectionable.

Working Models of the Safety Switch may be seen at Messrs. Davenport and Bridges, Cambridgeport, Mass., and at the office of the Railroad Journal, New York.

Plans, Specifications, and all information obtained on application to the Subscriber, Inventor, and Patentee  
**G. A. NICOLLS,**  
Reading, Pa. ja45

**RAILROAD IRON.—THE SUBSCRIBER'S** New Rail Iron Mill at Phoenixville, Pa., is expected to be ready to go into operation by the 1st of September, and will be capable of turning out 30 to 40 tons or finished Rails per day. They are now prepared to receive orders to that extent, deliverable after the 1st of October next, for heavy rails of any pattern now in use, equal in quality and finish to best imported.

**PIG IRON.**—They are also receiving weekly 150 to 200 tons of No. 1 Phoenix Foundry Iron, well adapted for light castings.

**REEVES, BUCK & CO.,**  
45 North Water St., Philadelphia,  
or by their Agent, **ROBT. NICHOLS,**  
79 Water St., New York 28f

**THE SUBSCRIBERS, AGENTS FOR** the sale of  
Codorus,  
Glendon,  
Spring Mill and Valley, } Pig Iron.

Have now a supply, and respectfully solicit the patronage of persons engaged in the making of Machinery, for which purpose the above makes of Pig Iron are particularly adapted.

They are also sole Agents for Watson's celebrated Fire Bricks and prepared Kaolin or Fire Clay orders for which are promptly supplied.

**SAM'L KIMBER & CO.,**  
59 North Wharves,  
Jan. 14, 1846. [1y4] Philadelphia, Pa.

river, (of which firm the subscriber was late a partner) under the immediate supervision of Mr. Ray himself.

Several sets of trucks containing the latest improvements have recently been turned out for the New York and Erie railroad, and the New Jersey Transportation company, which may be seen upon said roads.

The patronage of Railroad Companies and Car Builders is respectfully solicited.

**New York, May 4, 1846.** **W. H. CALKINS, and Others.**  
To all whom it may concern:—This is to certify that the New Haven, Hartford and Springfield railroad co., have had in use six sets of F. M. Ray's patent trucks for the last 20 months, during which time it appears to me, they have proved to be the best and most economical truck now in use.

[Signed,] **WILLIAM ROZ, Supt of Power.**  
I certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Philadelphia and Reading railroad for some time past, under a passenger car.

For simplicity of construction, economy in cost, lightness of material, and extreme ease of motion, I consider it the best truck we have ever used, its peculiar make also renders it less liable to be thrown off the track, when passing over any obstruction. We intend using it extensively under the passenger and freight cars of the above road.

**Reading, Pa., October 6, 1845.** [Signed,] **G. A. NICOLL,**  
Supt Transportation, etc., Philadelphia and Reading Railroad.

To all whom it may concern:—This is to certify that the N. Jersey Railroad and Transportation company have used Fowler M. Ray's Truck for the last seven months, during which time it has operated to our entire satisfaction. I have no hesitation in saying that it is the simplest and most economical truck now in use.

[Signed,] **T. L. SMITH,**  
**Jersey City, November 4, 1845.** N. Jersey Railroad and Transp. Co.  
This is to certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Long Island railroad for the last year, under a freight car.

For simplicity of construction, economy in cost, lightness of material and ease of motion, I consider it equal to any truck we have in use.  
**Long Island Railroad Depot, } [Signed,] JOHN LEACH,**  
**Jamaica November 12, 1845. } 1y19 Supt Motive Power.**

**RICH & CO'S IMPROVED PATENT SALAMANDER SAFES.**

Warranted free from dampness, as well as fire and thief proof.

Particular attention is invited to the following certificates, which speak for themselves:

**TEST No. 10.**

*Certificate from Mr. Silas C. Field, of Vicksburgh, Mississippi.*

On the morning of the 14th ult., the store owned and occupied by me in this city, was, with its contents, entirely consumed by fire. My stock of goods consisted of oil, rosin, lard, pork, sugar, molasses, liquors, and other articles of a combustible nature, in the midst of which was one of Rich's Improved Patent Salamander Safes, which I purchased last October of Mr. Isaac Bridge, New Orleans, and which contained my books and papers. This safe was red hot, and did not cool sufficiently to be opened until 16 hours after it was taken from the ruins. At the expiration of that time it was unlocked, when its contents proved to be entirely uninjured, and not even discolored. I deem this test sufficient to show that the high reputation enjoyed by Rich's Safes is well merited.

S. C. FIELD.

**TEST No. 11.—Certificate.**

By the fire which occurred in this village on the 27th July last, our Law Office, together with many other buildings, was destroyed—we had in our office one of Rich's Improved Patent Salamander Safes, which, though heated red hot, preserved, without being the least damaged, many papers valuable to our clients—the envelopes of a few papers being slightly scorched. Some twenty-four hours after the fire, the Safe was removed, and so hot was it, that several hours were required for it to cool off. Our office was in the second story of a large brick building, all the wood used in construction of said house being pitch pine. While the Safe was red hot, one of the walls tumbled in, and so injured the lock that it was necessary to break the door open. From this test, we feel no hesitancy in recommending "Rich's Patent Salamander Safe" as entirely fire proof.

GOREE & KING.

Marion, Ala., Sept. 15th, 1846.

*Still other Tests in the Great Fire of July 19, 1845.*

The undersigned purchased of A. S. Martin, No. 138½ Water street, one of Rich's Improved Patent Salamander Safes, which was in our store, No. 54 Exchange place. The store was entirely consumed in the great conflagration on the morning of the 19th inst. The safe was taken from the ruins 52 hours after, and on opening it, the books and papers were found entirely uninjured by fire, and only slightly wet—the leather on some of the books was parched by the extreme heat.

RICHARDS & CRONKHITE.

Benton, Miss., December 27, 1845.

One of Rich's Improved Salamander Safes, which I purchased on the 3d of June last of A. S. Marvin, 138½ Water street, agent for the manufacturer, was exposed to the most intense heat during the late dreadful conflagration. The store which I occupied, No. 46 Broad street, was entirely consumed; the safe fell from the 3d story, about 15 feet, into the cellar, and remained there 14 hours, and when found, I am told, and from its appearance afterwards, should judge that it had been heated to a red heat. On opening it, the books and papers were found not to have been touched by fire. I deem this ordeal sufficient to confirm fully the reputation that Rich's safe has already obtained for preserving its contents against all hazards.

(Signed.)

WM. BLOODGOOD.

New York, 21st July, 1845.

Reference made to upwards of nine hundred and fifty merchants, cashiers, brokers, and officers of courts and counties, who have Rich's Safe's in use.

The above safes are finished in the neatest manner, and can be made to order at short notice, of any size and pattern, and fitted to contain plate, jewelry, etc. Prices from \$50 to \$500 each. For sale by

A. S. MARVIN, General Agent,

138½ Water st., N. Y.

Also by Isaac Bridge 76 Magazine street, New Orleans.

Also by Lewis M Hatch, 190 Meeting street Charleston, S. C.

**FRENCH AND BAIRD'S PATENT SPARK ARRESTER.**

TO THOSE INTERESTED IN Railroads, Railroad Directors and Managers are respectfully invited to examine an improved SPARK ARRESTER, recently patented by the undersigned.

Our improved Spark Arresters have been extensively used during the last year on both passenger and freight engines, and have been brought to such a state of perfection that no annoyance from sparks or dust from the chimney of engines on which they are used is experienced.

These Arresters are constructed on an entirely different principle from any heretofore offered to the public. The form is such that a rotary motion is imparted to the heated air, smoke and sparks passing through the chimney, and by the centrifugal force thus acquired by the sparks and dust they are separated from the smoke and steam, and thrown into an outer chamber of the chimney through openings near its top, from whence they fall by their own gravity to the bottom of this chamber; the smoke and steam passing off at the top of the chimney, through a capacious and unobstructed passage, thus arresting the sparks without impairing the power of the engine by diminishing the draught or activity of the fire in the furnace.

These chimneys and arresters are simple, durable and neat in appearance. They are now in use on the following roads, to the managers and other officers of which we are at liberty to refer those who may desire to purchase or obtain further information in regard to their merits:

R. L. Stevens, President Camden and Amboy Railroad Company; Richard Peters, Superintendent Georgia Railroad, Augusta, Ga.; G. A. Nicolls, Superintendent Philadelphia, Reading and Pottsville Railroad, Reading, Pa.; W. E. Morris, President Philadelphia, Germantown and Norristown Railroad Company, Philadelphia; E. B. Dudley, President W. and R. Railroad Company, Wilmington, N. C.; Col. James Gadsden, President S. C. and C. Railroad Company, Charleston, S. C.; W. C. Walker, Agent Vicksburgh and Jackson Railroad, Vicksburgh, Miss.; R. S. Van Rensselaer, Engineer and Sup't Hartford and New Haven Railroad; W. R. M'Kee, Sup't Lexington and Ohio Railroad, Lexington, Ky.; T. L. Smith, Sup't New Jersey Railroad Trans. Co.; J. Elliott, Sup't Motive Power Philadelphia and Wilmington Railroad, Wilmington, Del.; J. O. Sterns, Sup't Elizabethtown and Somerville Railroad; R. R. Cuyler, President Central Railroad Company, Savannah, Ga.; J. D. Gray, Sup't Macon Railroad, Macon, Ga.; J. H. Cleveland, Sup't Southern Railroad, Monroe, Mich.; M. F. Chittenden, Sup't M. P. Central Railroad, Detroit, Mich.; G. B. Fisk, President Long Island Railroad, Brooklyn.

Orders for these Chimneys and Arresters, addressed to the subscribers, care Messrs. Baldwin & Whitney, of this city or to Hinckly & Drury, Boston, will be promptly executed.

FRENCH & BAIRD.

N. B.—The subscribers will dispose of single rights, or rights for one or more States, on reasonable terms.

Philadelphia, Pa., April 6, 1844.

•• The letters in the figures refer to the article given in the Journal of June, 1844.

ja45

**PATENT HAMMERED RAILROAD, SHIP**

and Boat Spikes. The Albany Iron and Nail Works have always on hand, of their own manufacture, a large assortment of Railroad, Ship and Boat Spikes, from 2 to 13 inches in length, and of any form of head. From the excellence of the material always used in their manufacture, and their very general use for railroads and other purposes in this country, the manufacturers have no hesitation in warranting them fully equal to the best spikes in market, both as to quality and appearance. All orders addressed to the subscriber at the works, will be promptly executed.

JOHN F. WINSLOW, Agent.

Albany Iron and Nail Works, Troy, N. Y. The above spikes may be had at factory prices, of Erastus Corning & Co., Albany; Hart & Merritt, New York; J. H. Whitney, do.; E. J. Etting, Philadelphia; Wm. E. Coffin & Co., Boston.

ja45

**MACHINE WORKS OF ROGERS,**

Ketchum & Grosvenor, Patterson, N. J. The undersigned receive orders for the following articles, manufactured by them of the most superior description in every particular. Their works being extensive and the number of hands employed being large, they are enabled to execute both large and small orders with promptness and despatch.

Railroad Work.

Locomotive steam engines and tenders; Driving and other locomotive wheels, axles, springs & flange tires; car wheels of cast iron, from a variety of patterns, and chills; car wheels of cast iron with wrought tires; axles of best American refined iron; springs; boxes and bolts for cars.

Cotton, Wool and Flax Machinery of all descriptions and of the most improved patterns, style and workmanship.

Mill gearing and Millwright work generally; hydraulic and other presses; press screws; callenders; lathes and tools of all kinds; iron and brass castings of all descriptions.

ROGERS, KETCHUM & GROSVENOR, Paterson, N. J., or 60 Wall street, N. York.

**PATENT RAILROAD, SHIP AND BOAT**

Spikes. The Troy Iron and Nail Factory keeps constantly for sale a very extensive assortment of Wrought Spikes and Nails, from 3 to 10 inches, manufactured by the subscriber's Patent Machinery, which after five years' successful operation, and now almost universal use in the United States (as well as England, where the subscriber obtained a patent) are found superior to any ever offered in market.

Railroad companies may be supplied with Spikes having countersink heads suitable to holes in iron rails, to any amount and on short notice. Almost all the railroads now in progress in the United States are fastened with Spikes made at the above named factory—for which purpose they are found invaluable, as their adhesion is more than double any common spikes made by the hammer.

All orders directed to the Agent, Troy, N. York will be punctually attended to.

HENRY BURDEN, Agent.

Spikes are kept for sale, at Factory Prices, by I. & J. Townsend, Albany, and the principal iron merchants in Albany and Troy; J. I. Brower, 222 Water St., New York; A. M. Jones, Philadelphia; T. Janviers, Baltimore; Degrand & Smith, Boston.

•• Railroad Companies would do well to forward their orders as early as practicable, as the subscriber is desirous of extending the manufacturing so as to keep pace with the daily increasing demand.

ja45

**DAVENPORT & BRIDGES CONTINUE**

to Manufacture to Order, at their Works, in Cambridgeport, Mass., Passenger and Freight Cars of every description, and of the most improved pattern. They also furnish Snow Ploughs and Chilled Wheels of any pattern and size. Forged Axles, Springs, Boxes and Bolts for Cars at the lowest prices. All orders punctually executed and forwarded to any part of the country.

Our Works are within fifteen minutes ride from State street, Boston—coaches pass every fifteen minutes.

## THE HERRON RAILWAY TRACK,

As seen stripped of the top ballasting

A GOLD MEDAL AWARDED THE INVENTOR BY THE AMERICAN INSTITUTE.

**THE UNDERSIGNED RESPECTFULLY** invites the attention of Engineers, and Railroad Companies, to some highly important improvements he has recently made in the Herron system of Railway structure. These improvements enable him to effect a very large reduction in the quantity of Timber, and cost of construction, without impairing the strength of the Track, or its powers of resisting frost, while they secure additional features of excellence in the Drainage and facility of making Repairs.

The above cut represents the "Herron Track" as it is laid on the Philadelphia and Reading, and on the Baltimore and Susquehanna Railroads. The intersection of the sills of the trallis are 5 feet from centre to centre, while in the new construction they are only 2½ feet. This renders the string piece unnecessary, thus removing the only objectionable feature found in the Track.

The result of experience has proved that all Tracks constructed with longitudinal timbers, such as mud sills, and more especially, the continuous bearing string pieces retain the rain water that falls between the Rails, which, being thus confined, settles along those timbers, and accumulating in quantity flows rapidly along them on the descending grades, washing out the earth from under the timber, and frequently causing large breaches in the embankments of the road. Whereas all water intercepted by the oblique sills of the trallis, is discharged immediately into the side ditches.

In the 5 foot plan, the Track occupies a Road bed nearly 11 feet wide, while the new construction takes

but 8 feet; the timber being more concentrated under the Rails. A block of hard wood, about 2 feet long and 15 inches wide, is introduced into a square of the trallis for the purpose of giving an additional, and effectual support to the joints of the Rails, which rest upon it. Should these joint blocks become chafed and worn by the working, and imbedding of the chairs, as is now the case on all Railroads, they can be readily replaced without any derangement of the timbers less liable to wear.

The following is a general estimate of its cost near the seaboard. In the interior it will be considerably less.

ESTIMATE OF THE PROBABLE COST OF ONE MILE.		
4,224 Timbers, 11 ft. long, 3 x 6 inches =	68,696 ft. b.m., at \$10 =	\$686 96
587 Oak joint blocks 2 ft. x 3 x 15 in. =	4,403 ft. b.m., at \$13 =	57 24
13,000 Spikes = 2,250 lbs. at 4½ cts. =		101 25
Workmanship free of patent charge =		600 00

Cost of one mile including the laying of the Rail ..... \$1,445 45

He has made other important improvements, which will be shown in properly proportioned models, that give a much better idea of the great strength of the Track than a drawing will do.

Sales of the Patent right to all the distant States will be made on liberal terms.

JAMES HERRON.

Civil Engineer and Patentee.

No. 277 South Tenth St., Philadelphia. 33ct

**ENGLISH PATENT WIRE ROPES—FOR THE USE OF MINES, RAILWAYS, ETC.—** for sale or imported to order by the subscriber.

These Ropes are manufactured on an entirely different principle from any other, and are now almost exclusively used in the collieries and on the railways in Great Britain, where they are considered to be greatly superior to hempen ones, or iron chains, as regards safety, durability and economy. The plan upon which they are made effectually secures them from corrosion in the interior, as well as the exterior of the rope, and gives a greater compactness and elasticity than is found in any other manufacture.

Many of these ropes have been in constant operation in the different mines in England, and on the Blackwall and other inclined planes, for three and four years, and are still in good condition.

They have been applied to almost every purpose for which hempen ropes have been used—mines, heavy cranes, standing rigging, window cords, lightning conductors, signal halyards, tiller ropes, etc. Reference is made to the annexed statement for the relative strength and size. Testimonials from the most eminent engineers in England can be shown as to their efficiency, and any additional information required respecting the different descriptions and application will be given by

ALFRED L. KEMP,

75 Broad street, New York, sole agent in the United States.

Statement of Trial made at the Woolwich Royal Dock Yard, of the Patent Wire Ropes, as compared with Hempen Ropes and Iron Chains of the same strength.—October, 1841.

WIRE ROPES.			HEMPEN ROPES.			CHAINS.		STRENGTH Tons.
Wire gauge number.	Circumference of rope.	Weight per fathom.	Circumference of rope.	Weight per fathom.		Weight per fathom.	Diameter of iron.	
	INCH.	LBS. OZ.	INCH.	LBS. OZ.		LBS.	INCH.	
11	4½	13 5	10	24 -		50	15-16	90
13	3½	8 3	8½	16 -		27	11-16	13½
14	3½	6 11	7½	12 8		17	9-16	10½
15	2½	5 2	6½	9 4		13½	1-2	7½
16	2½	4 3	6	8 4		10½	7-16	7

N.B. The working load, with a perpendicular lift, may be taken at 6 cwt. for every lb. weight per fathom, so that a rope weighing 5 lbs. per fathom would safely lift 3360 lbs., and so on in proportion. 1724

**BOSTON AND PROVIDENCE RAILROAD.** Passenger Notice. Summer Arrangement. On and after Monday, Sept. 28, 1846, the Passenger Trains will run as follows:

For New York—Night Line, via Stonington. Leaves Boston every day, but Sunday, at 5 p.m. Accommodation Trains, leave Boston at 7½ a.m. and 3½ p.m., and Providence at 8 a.m. and 3½ p.m. Dedham trains, leave Boston at 9 a.m.; 3 p.m., 5½ p.m., and 10½ p.m. Leave Dedham at 8 a.m. and 4½ and 9 p.m. Stoughton trains, leave Boston at 11½ a.m. and 4-10 p.m. Leave Stoughton at 8 a.m. and 2½ p.m. All baggage at the risk of the owners thereof.

31 ly W. RAYMOND LEE, Sup't.

**BRANCH RAILROAD AND STAGES CONNECTING** with the Boston and Providence Railroad.

Stages connect with the Accommodation trains at the Foxboro' Station, to and from Woonsocket. At the Seekonk Station, to and from Lonsdale, R. I. via Pawtucket. At the Sharon Station, to and from Walpole, Mass. And at Dedham Village Station, to and from Medford, via Medway, Mass. At Providence, to and from Bristol, via Warren, R. I.—Taunton, New Bedford and Fall River cars run in connection with the accommodation trains.

## BOSTON AND MAINE RAILROAD.

Upper Route, Boston to Portland via, Reading, Andover, Haverhill, Exeter, Dover, Great Falls, South & North Berwick, Wells, Kennebunk and Saco.

Winter Arrangement, 1846-7.

On and after October 5th, 1846, Passenger Trains will leave daily, (Sundays excepted,) as follows: Boston for Portland at 7½ a.m. and 2½ p.m. Boston for Great Falls at 7½ a.m., 2½ and 3-25 p.m.

Boston for Haverhill at 7½ and 11½ a.m., 2½, 3-25 and 5 p.m.

Boston for Reading at 7½, and 11½ a.m., 2½, 3-25 5 and 6½ p.m.

Portland for Boston at 7½ a.m., and 3 p.m. Great Falls for Boston at 6½ and 9½ a.m., and 4½ p.m.

Haverhill for Boston at 7½, 8½, and 11 a.m. and 3 and 6½ p.m.

Reading for Boston at 7, 8½ and 9½ a.m., 12 m., 1½, 4 and 7½ p.m.

The Depot in Boston is on Haymarket Square.

Passengers are not allowed to carry Baggage above \$50 in value, and that personal Baggage, unless notice is given, and an extra amount paid, at the rate of the price of a Ticket for every \$500 additional value.

1y31 CHAS. MINOT, Sup'r.

## THE BEST RAILROAD ROUTE TO THE

Lake and Buffalo, from Cincinnati.

Take Cars to Xenia, 65

miles; take Stage to Mansfield, 88 miles; thence by Cars to Sandusky, 56 miles to the Lake; thence Steamboat to Buffalo, 230 miles.

Fare from Cincinnati to Sandusky.....\$3 00

" " Sandusky to Buffalo, Cabin..... 6 00

" " " " Steerage..... 4 50

Fare by this route, although the cheapest across the state, will be reduced in a short time, railroad lengthened, and speed increased.

Leave Cincinnati in the morning, arrive at Columbus at night.

Leave Columbus in the morning, arrive at Sandusky same day.

Leave Sandusky, by Boat, in the morning, arrive at Buffalo next morning in time for the Cars north and east for Niagara Falls, Canada, Saratoga Springs, Troy, Albany, Boston, New York, Washington, or Philadelphia.

Passengers should not omit to pay their fare through from Cincinnati to Sandusky, or from Columbus to Sandusky via Mansfield; as this route is the only one that secures 56 miles [this road is run over in 2h. 50m.] most railroad which is new, and is the shortest, cheapest and most expeditious across the state.

Fares on the New York Railroads are about to be reduced.

Sandusky, Ohio.

B. HIGGINS, Sup't, etc.

M. & S. C. R. R. Co.

## SUMMER ARRANGEMENT.—NEW YORK

AND ERIE RAILROAD LINE, from April

1st until further notice, will

run daily (Sundays excepted) between the city of New York and Middletown, Goshen, and intermediate places, as follows:

FOR PASSENGERS—

Leave New York at 7 A. M. and 4 P. M.

" Middletown at 6½ A. M. and 5½ P. M.

FARE REDUCED TO \$1 25 to Middletown—way in proportion. Breakfast, supper and berths can be had on the steamboat.

FOR FREIGHT—

Leave New York at 5 P. M.

" Middletown at 12 M.

The names of the consignee and of the station where to be left, must be distinctly marked upon each article shipped. Freight not received after 5 P. M. in New York.

Apply to J. F. Clarkson, agent, at office corner of Duane and West sts. H. C. SEYMOUR, Sup't. March 25th, 1846.

Stages run daily from Middletown, on the arrival of the afternoon train, to Millford, Carbondale, Honesdale, Montrose, Towanda, Owego, and West; also to Monticello, Windsor, Binghamton, Ithaca, etc., etc. Agent on board. 13tf

## NORWICH AND WORCESTER RAIL-

Road. Summer Arrangement, commencing Monday, April 6, 1846.

Accommodation Trains, daily,

except Sunday. Leave Norwich, at 6 a.m., and 4½ p.m. Leave Worcester, at 10 a.m., and 4½ p.m.

The morning Accommodation Trains from Norwich, and from Worcester, connect with the trains of the Boston, and Worcester and Western railroads each way.

The Evening Accommodation Train from Worcester connects with the 1½ p.m. train from Boston.

New York Train via Long Island Railroad:

Leave Allyn's Point for Boston, about 1 p.m., daily, except Sunday.

Leave Worcester for New York, about 10 a.m., stopping at Webster, Danielsonville, and Norwich.

New York Train via Steamboat—Leave Norwich for Boston, every morning, except Monday, on the arrival of the steamboat from New York, stopping at Norwich and Danielsonville.

Leave Worcester for New York, upon the arrival of the train from Boston, at about 4½ p.m., daily, except Sunday, stopping at Webster, Danielsonville and Norwich.

Freight Trains daily each way, except Sunday.—Special contracts will be made for cargoes, or large quantities of freight, on application to the superintendent.

Fares are Less when paid for Tickets than when paid in the Cars. 321y

J. W. STOWELL, Sup't.

**TROY RAILROADS.—IMPORTANT NOTICE.**—Troy and Greenbush Railroad, forming a continuous track from Boston to Buffalo and Saratoga Springs.

This road is new, and laid with the heaviest iron H rail. Trains will always be run on this road connecting at Greenbush each way with the trains to and from Boston and intermediate places, leaving Greenbush daily at 1 1/2 p.m. and 6 p.m., or on arrival of the trains from Boston; leave Troy at 7 1/2 a.m. and 4 1/2 p.m., or to connect with trains to Boston.

Trains also run hourly on this road between Troy and Albany. Running time between Greenbush and Troy, 15 minutes.

#### TROY AND SCHENECTADY RAILROAD.

This road is laid its entire length with the heaviest H rail—which is not the fact with the road from Albany. Trains will always be run on this road connecting each way, to and from Buffalo and intermediate places. Leave Troy for Buffalo at 7 1/2 a.m. and 1 p.m. and 6 1/2 p.m., or to connect with the trains for the west; leave Schenectady at 2 1/2 a.m., 8 1/2 a.m., 1 p.m. and 3 1/2 p.m., or on arrival of the trains from Buffalo and intermediate places.

#### TROY AND SARATOGA RAILROAD.

THE ONLY DIRECT ROUTE.

No change of passenger, baggage or other cars on this route. Cars leave Troy for Ballston, Saratoga Springs, Lake George and White Hall at 7 1/2 a.m., (arriving one hour in advance of the train from Albany,) and at 3 1/2 p.m. Returning, leave Saratoga at 9 a.m. and 3 1/2 p.m., (reaching Troy in time for the evening boats to New York.) Cars also leave Troy for the Burrough at 3 1/2 p.m. and 7 p.m., connecting with packet boats for the north. This takes passengers from New York and Boston to Montreal in 44 hours.

N.B. Travellers will find the routes through Troy most convenient and economical, and as expeditious as any other. The steamboats to and from New York land within a few steps of the railroad office, and passengers are taken up and landed by the different railroad lines at the doors of principal hotels, thus saving all necessity for, and annoyance from, hack drivers, cabmen, runners, etc.

Aug 3, 1846.

#### BALTIMORE AND OHIO RAILROAD.

MAIN STEM. The Train carrying the

Great Western Mail leaves Baltimore every morning at 7 1/2 and Cumberland and at 8 o'clock, passing Ellicott's Mills, Frederick, Harpers Ferry, Martinsburgh and Hancock, connecting daily each way with the Washington Trains at the Relay House seven miles from Baltimore, with the Winchester Trains at Harpers Ferry—with the various railroad and steamboat lines between Baltimore and Philadelphia and with the lines of Post Coaches between Cumberland and Wheeling and the fine Steamboats on the Monongahela Slack Water between Brownsville and Pittsburgh. Time of arrival at both Cumberland and Baltimore 5 1/2 P. M. Fare between those points \$7, and 4 cents per mile for less distances. Fare through to Wheeling \$11 and time about 36 hours, to Pittsburgh \$10, and time about 32 hours. Through tickets from Philadelphia to Wheeling \$13, to Pittsburgh \$12. Extra train daily except Sundays from Baltimore to Frederick at 4 P. M., and from Frederick to Baltimore at 8 A. M.

#### WASHINGTON BRANCH.

Daily trains at 9 A. M. and 5 P. M. and 12 at night from Baltimore and at 6 A. M. and 5 1/2 P. M. from Washington, connecting daily with the lines North, South and West, at Baltimore, Washington and the Relay house. Fare \$1 60 through between Baltimore and Washington, in either direction, 4 cents per mile for intermediate distances. s13y1

**THE SUBSCRIBER IS PREPARED TO** execute at the Trenton Iron Works, orders for Railroad Iron of any required pattern, and warranted equal in every respect in point of quality to the best American or imported Rails. Also on hand and made to order, Bar Iron, Braziers' and Wire Rods, etc., etc.

PETER COOPER 17 Burling Slip.

New York.

#### NEW RAILROAD ROUTE FROM BUFFALO TO CINCINNATI.

Passengers destined for Columbus and Cincinnati, O., Louisville, Ky., St. Louis, Mo., Memphis, Tenn., Vicksburg, Natchez, New Orleans, and all intermediate ports, will find a new, and the most expeditious and comfortable Route, by taking Steamboats at Buffalo, landing at Sandusky City, Ohio, distance 230 miles.

From thence by Cars, over the Mansfield Railroad which is new and just opened [laid with heavy iron,] to Mansfield, distance 56 " Thence by Stage via Columbus to Xenia over gravel and Macadamized Road, (the best in the state,) in new coaches, distance 88 " Thence, over the Little Miami Railroad, from Xenia to Cincinnati, distance 65 "

#### TIME.

From Buffalo to Sandusky 24 hours. Leave Sandusky 5 a.m. to Columbus 14 " From Columbus to Cincinnati 15 "

Or say 30 hours from Sandusky to Cincinnati over this route, including delays.

#### FARE.

From Buffalo to Sandusky, Cabin \$6 00 " " " Steerage 3 00 " Sandusky to Columbus 4 50 " " through to Cincinnati 8 00

Passengers should not omit to pay their fare through from Sandusky City to Cincinnati and take receipts availing themselves of the benefit of a contract existing between the said Railroad and Stage Co's, securing 121 miles travel by good Railroad and 88 miles by Stage, in crossing from Lake Erie to the Ohio river, in the space of 3 1/2 hours.

Passengers destined for St. Louis, or any point below on the Mississippi, will save by taking this route, from 4 to 6 days time and travel, and nearly half the expense, over the Chicago and Peoria route to the above places.

Fare by this route, although the cheapest, will in a short time be reduced, Railroad lengthened, and speed increased.

B. HIGGINSON, Sup't, etc.

M. & S. C. R. R. Co.

Sandusky City, Ohio.

#### NEW YORK & HARLEM RAILROAD CO.—Winter Arrangement.

On and after Monday, November 23, 1846, the cars will run as follows:

Leave 27th street for 42d street, Deaf and Dumb Institute, Yorkville, Harlem Morrianna, and Williams' Bridge, at 7 o'clock a.m. From City Hall for above named places, 2 p.m. [freight train,] 2 30 p.m. 5 p.m. to Morrisania only.

Leave City Hall for Harlem, Morrisania, Fordham and Williams' Bridge, at 7 45 a.m., and 10 45 a.m.; 1 15 p.m., 2 p.m. [freight train,] 2 30 p.m. and 3 45 p.m.

Leave City Hall for Hunt's Bridge, Bronx, Tuckahoe, Hart's Corners White Plains, Davis' Brook, Unionville and Pleasantville, [Pleasantville 4 miles from Sing Sing,] 7 45 and 10 45 a.m.; 1 15 p.m., 2 p.m. [freight train,] and 3 45 p.m.

#### RETURNING.

Leave Pleasantville, at 8, 10, [freight train,] and 11 a.m.; 1 30, and 4 p.m.

Leave White Plains, at 8 12, 10 30, [freight train] and 11 20 a.m.; 1 50, and 4 20 p.m.

Leave Tuckahoe, 8 35, 10 55, [freight train,] and 11 35 a.m.; 2 05, and 4 35 p.m.

Leave Williams' Bridge at 7 45, 8 50 and 11 50 a.m.; 2 10, 4, and 4 50 p.m.

Leave Morrisania 8 and 9 05 a.m.; 12 05, 2 35, 4 20, 5 05 and 6 p.m.

Leave Yorkville, at 8 12 a.m.; 4 35 and 6 15 p.m.

#### SUNDAY ARRANGEMENTS.

Leave City Hall for Pleasantville and intermediate places, at 7 45 a.m.; 1 15 and 3 p.m.

Leave Pleasantville for City Hall, at 8 a.m.; 11, and 3 15 p.m.

Leave City Hall for Williams' Bridge and intermediate places, 10 45 a.m.; 2 30 p.m.

Leave Williams' Bridge for City Hall, at 8 50 and 11 50 a.m.; 1, 3 45 and 4 05 p.m. 1y49

#### BALTIMORE AND SUSQUEHANNA Railroad.—Reduction of Fare. Morning and Afternoon Trains between Baltimore and York.—The Passenger

trains run daily, except Sunday, as follows: Leaves Baltimore at 9 a.m. and 3 1/2 p.m. Arrives at 9 a.m. and 6 1/2 p.m. Leaves York at 5 a.m. and 3 p.m. Arrives at 12 1/2 p.m. and 8 p.m. Leaves York for Columbia at 1 1/2 p.m. and 8 a.m. Leaves Columbia for York at 8 a.m. and 2 p.m.

#### FARE.

Fare to York \$1 50 " Wrightsville 2 00 " Columbia 2 12 1/2

Way points in proportion.

#### PITTSBURG, GETTYSBURG AND HARRISBURG.

Through tickets to Pittsburg via stage to Harrisburg \$9 Or via Lancaster by railroad 10 Through tickets to Harrisburg or Gettysburg 3 In connection with the afternoon train at 3 1/2 o'clock, a horse car is run to Green Spring and Owid's Mill, arriving at the Mills at 5 1/2 p.m. Returning, leaves Owid's Mills at 7 a.m.

D. C. H. BORDLEY, Sup't.

31 ly Ticket Office, 63 North st.

#### LEXINGTON AND OHIO RAILROAD.

Trains leave Lexington for Frankfort daily, at 5 o'clock a.m., and 2 p.m.

Trains leave Frankfort for Lexington daily, at 8 o'clock a.m. and 2 p.m. Distance, 25 miles. Fare \$1 25.

On Sunday but one train, 5 o'clock a.m. from Lexington, and 2 o'clock p.m. from Frankfort.

The winter arrangement (after 15th September to 15th March) is 6 o'clock a.m. from Lexington, and ma. 9. from Frankfort, other hours as above.

351y

#### SOUTH CAROLINA RAILROAD.—A Passenger Train runs daily from Charleston,

on the arrival of the boats from Wilmington, N. C., in connection with trains on the Georgia, and Western and Atlantic Railroads—and by stage lines and steamers connects with the Montgomery and West Point, and the Tusculumbia Railroad in N. Alabama. Fare through from Charleston to Montgomery daily \$26 50

Fare through from Charleston to Huntsville, Decatur and Tusculumbia 22 00

The South Carolina Railroad Co. engage to receive merchandize consigned to their order, and to forward the same to any point on their road; and to the different stations on the Georgia and Western and Atlantic railroad; and to Montgomery, Ala., by the West Point and Montgomery Railroad.

1y25 JOHN KING, Jr, Agent.

#### CENTRAL RAILROAD—FROM SAVANNAH to Macon. Distance 190 miles.

This Road is open for the transportation of Passengers and Freight. Rates of Passage, \$8 00. Freight—

On weight goods generally 50 cts. per hundred. On measurement goods 13 cts. per cubic ft.

On brls. wet (except molasses and oil) \$1 50 per barrel.

On brls. dry (except lime) 80 cts. per barrel.

On iron in pigs or bars, castings for mills, and unboxed machinery 40 cts. per hundred.

On hds. and pipes of liquor, not over 120 gallons \$5 00 per hhd.

On molasses and oil \$6 00 per hhd.

Goods addressed to F. WINTER, Agent, forwarded free of commission.

THOMAS PURSE, y40 Gen'l. Sup't. Transportation.

#### MANUFACTURE OF PATENT WIRE

Rope and Cables for Inclined Planes, Standing Ship Rigging, Mines, Cranes, Tillers etc., by JOHN A. ROEBLING, Civil Engineer, Pittsburgh, Pa.

These Ropes are in successful operation on the planes of the Portage Railroad in Pennsylvania, on the Public Slips, on Ferries and in Mines. The first rope put upon Plane No. 3, Portage Railroad, has now run 4 seasons, and is still in good condition. 2v191y

**CENTRAL AND MACON AND WESTERN** Railroads, Ga.—These Roads with the Western and Atlantic Railroad of the State of Georgia, form a continuous line from Savannah to Oothcaloga, Ga., of 371 miles, viz:

Savannah to Macon—Central Railroad ..... 190  
Macon to Atlanta—Macon and Western ..... 101  
Atlanta to Oothcaloga—Western and Atlantic... 80

Goods will be carried from Savannah to Atlanta and Oothcaloga, at the following rates, viz:

On Weight Goods—Sugar, Coffee, Liquor, Bagging, Rope, Butter, Cheese, Tobacco, Leather, Hides, Cotton Yarns, Copper, Tin, Bar & Sheet Iron, Hollow Ware & Castings.....	To Atlanta.	To Oothcaloga.

Ploughs, (large,) Cultivators, Corn Shellers, and Straw Cutters, each.....	1 25	1 50
Ploughs, (small,) and Wheelbarrows.....	0 80	1 05
Salt, per Liverpool Sack.....	0 70	0 95
Passage—Savannah to Atlanta, \$10; Children, under 12 years of age, half price, Savannah to Macon, \$7.		

Goods consigned to the subscriber will be forwarded free of Commissions.

Freight may be paid at Savannah, Atlanta or Oothcaloga.

F. WINTER, Forwarding Agent, C. R. R.  
Savannah, Aug. 15th, 1846. 1y34

**GREAT SOUTHERN MAIL LINE! VIA** Washington city, Richmond, Petersburg, Weldon and Charleston, S. C., direct to New Orleans. The only Line which carries the Great Southern Mail, and Twenty-four Hours in advance of Bay Line, leaving Baltimore same day.

Passengers leaving New York at 4½ P.M., Philadelphia at 10 P.M., and Baltimore at 6½ A.M., proceed without delay at any point, by this line, reaching Richmond in eleven, Petersburg in thirteen and a half hours, and Charleston, S. C., in two days from Baltimore.

Fare from Baltimore to Charleston.....\$21 00  
" " " Richmond..... 6 60

For Tickets, or further information, apply at the Southern Ticket Office, adjoining the Washington Railroad Office, Pratt street, Baltimore, to 1y14

**RAILROAD SCALES.—THE ATTENTION** of Railroad Companies is particularly requested to Ellicott's Scales, made for weighing loaded cars in trains, or singly, they have been the inventors, and the first to make platform scales in the United States; supposing that an experience of 20 years has given a knowledge and superior advantage in the business.

The levers of our scales are made of wrought iron, all the bearers and fulcrums are made of the best cast steel, laid on blocks of granite, extending across the pit, the upper part of the scale only being made of wood. E. Ellicott has made the largest Railroad Scale in the world, its extreme length was one hundred and twenty feet, capable of weighing ten loaded cars at a single draft. It was put on the Mine Hill and Schuylkill Haven Railroad.

We are prepared to make scales of any size to weigh from five pounds to two hundred tons.

ELLICOTT & ABBOTT.  
Factory, 9th street, near Coates, cor. Melon st.  
Office, No. 3 North 5th street,  
1y25 Philadelphia, Pa.

**GEORGIA RAILROAD. FROM AUGUSTA to ATLANTA—171 MILES.**  
AND WESTERN AND ATLANTIC RAILROAD FROM ATLANTA to OOTHCALOGA, 80 MILES.

This Road in connection with the South Carolina Railroad and Western and Atlantic Railroad now forms a continuous line, 358 miles in length, from Charleston to Oothcaloga on the Oostenaula River, in Cass Co., Georgia.

#### RATES OF FREIGHT.

	Between Augusta and Oothcaloga. 250 miles.	Between Charleston and Oothcaloga. 356 miles.
1st class. Boxes of Hats, Bonnets, and Furniture, per cubic foot.....	\$0 16	\$0 25
2d class. Boxes and Bales of Dry Goods, Saddlery, Glass, Paints, Drugs and Confectionary, per 100 lbs.	0 90	1 40

Cotton, per 100 lbs.....	0 45	0 65
Molasses, per hogshead.	8 50	13 50
" " barrel.....	2 00	3 25
Salt per bushel.....	0 17	95
Salt per Liverpool sack..		
Ploughs, Corn Shellers, Cultivators, Straw Cutters, Wheelbarrows...	0 75	1 37

German or other emigrants, in lots of 20 or more, will be carried over the above roads at 2 cents per mile.

Goods consigned to S. C. Railroad Co. will be forwarded free of commissions. Freight may be paid at Augusta, Atlanta, or Oothcaloga.

J. EDGAR THOMSON,  
Ch. Eng. and Gen. Agent.  
Augusta, Sept. 2d, 1846. \*44 1y

**THE WESTERN AND ATLANTIC** Railroad.—This Road is now in operation to Oothcaloga, a distance of 80 miles, and connects daily (Sundays excepted) with the Georgia Railroad.

From Kingston, on this road, there is a tri-weekly line of stages, which leave on the arrival of the cars on Tuesday, Thursday and Saturday, for Warren, Huntsville, Decatur and Tusculumbia, Alabama, and Memphis, Tennessee.

On the same days, the stages leave Oothcaloga for Chattanooga, Jasper, Murfreesborough, Knoxville and Nashville, Tennessee.

This is the most expeditious route from the east to any of these places.

CHAS. F. M. GARNETT,  
Chief Engineer.  
Atlanta, Georgia, April 16th, 1846. 1y1

**TO RAILROAD COMPANIES AND MANUFACTURERS** of railroad Machinery. The subscribers have for sale Am. and English bar iron, of all sizes; English blister, cast, shear and spring steel; Juniata rods; car axles, made of double refined iron; sheet and boiler iron, cut to pattern; tiers for locomotive engines, and other railroad carriage wheels, made from common and double refined B. O. iron; the latter a very superior article. The tires are made by Messrs. Baldwin & Whitney, locomotive engine manufacturers of this city. Orders addressed to them, or to us, will be promptly executed.

When the exact diameter of the wheel is stated in the order, a fit to those wheels is guaranteed, saving to the purchaser the expense of turning them out inside.

THOMAS & EDMUND GEORGE,  
E. cor. 12th and Market sts., Philad., Pa. 1y

**LITTLE MIAMI RAILROAD.—OPEN** TO SPRINGFIELD—Distance 84 miles—

connecting at Xenia and Springfield with Messrs. Neil, Moore, & Co's. daily daylight lines of stages going east and north, to Columbus, Zanesville, Wheeling, Cleveland, and Sandusky City. via Urbana, Bellefontaine, Kenion, and the Mad river and lake Erie railroad, or Columbus, Delaware, and the Mansfield and Sandusky City railroad—forming, by these connections, the cheapest and most expeditious route to Buffalo, Niagara Falls, Rochester, Albany, New York, and Boston.

On and after Thursday, August 13, 1846, until further notice, a Passenger train will run as follows: Leave Cincinnati daily at 9 A. M., for Millford, Foster's Crossing, Deerfield, Morrow, Fort Ancient, Freeport, Waynesville, Spring Valley, Xenia, Old Town, Yellow Springs, and Springfield.

Returning, will leave Springfield at 4 hours 35 minutes A. M. A line of Hacks runs in connection with the Cars, between Deerfield and Lebanon.

FARE—From Cincinnati to Lebanon....\$1 00  
" " " Xenia..... 1 50  
" " " Springfield... 2 00  
" " " Columbus... 4 00  
" " " Sandusky city 8 00

The Passenger trains runs in connection with Strader & Gorman's line of Mail Packets to Louisville.

Tickets can be procured at the Broadway Hotel, Dennison House, or at the Depot of the Company, on East Front street.

Further information and through tickets for the Stage lines, may be procured at P. Campbell, Agent on Front street, near Broadway.

The company will not be responsible for baggage beyond 50 dollars in value, unless the same is returned to the conductor or agent, and freight paid at of a passage for every \$500 in value over that amount.

The 1½ P. M. train from Cincinnati, and the 2 40 P. M. train from Xenia, will be discontinued on and after Monday, the 10th instant.

A freight train will run daily.

W. H. CLEMENT, Sup't.

**PHILADELPHIA, WILMINGTON & BALTIMORE RAILROAD.—1847.**

Winter Arrangement.

Philadelphia for Baltimore... 8 a.m. and 4 p.m.  
Baltimore for Philadelphia... 9 a.m. and 8 p.m.

Connecting in Baltimore with Mail Lines south and west, as per notice of the Baltimore and Ohio Railroad—and with Mail Lines north from Philadelphia, both morning and afternoon.

Sundays, the Morning Lines do not run in either direction.

Accommodation train from Wilmington to Philadelphia, leaves Wilmington at 8 a.m., and returns at 2 p.m.

J. R. TRIMBLE,  
2d Engineer and General Superintendent.

**LAWRENCE'S ROSENDALE HYDRAULIC** Cement. This cement is warranted equal to any manufactured in this country, and has been pronounced superior to Francis' "Roman." Its value for Aqueducts, Locks, Bridges, Floods, and all Masonry exposed to dampness, is well known, as it sets immediately under water, and increases in solidity for years.

For sale in lots to suit purchasers, in tight paper-barrels, by JOHN W. LAWRENCE,  
142 Front street, New York.

Orders for the above will be received and promptly attended to at this office. 32 1y

**SPRING STEEL FOR LOCOMOTIVES,** Tenders and Cars. The Subscriber is engaged in manufacturing Spring Steel from 1½ to 6 inches in width, and of any thickness required: large quantities are yearly furnished for railroad purposes, and wherever used, its quality has been approved of. The establishment being large, can execute orders with great promptitude, at reasonable prices, and the quality warranted. Address

JOAN F. WINSLOW, Agent,  
Albany Iron and Nail Works,

REPORT OF ENGINEER AND SUPERINTENDENT.  
*John Tucker, Esq., President of the Philadelphia and Reading Railroad Company*

SIR:—The following report of the Transportation, Roadway, and Construction Departments, for the year ending November 30, 1846, is respectfully submitted.

**Transportation Department.**—The business of the road, including coal and merchandize tonnage, passengers, and receipts from these sources, is contained in statement A.—The receipts from coal have increased 80 per cent.; from merchandize 127; and from passengers 37 per cent. over the same items last year.

The gross and net expenses of this department are comprised in statements B and C; the former containing the total expenditures for wages and all materials; and the latter the apportionment of these expenses to the various branches of business for which they were contracted.

The running machinery will be found in statement D. Since the date of my last report, 19 locomotive engines, all of the first class, including two of great power and efficiency, for the Falls Grade, have been purchased by the company; 4 second class engines, hitherto light and inefficient machines, have been rebuilt in the company's workshops

at Reading, and now work with power and efficiency increased over 100 per cent.

The car force of the road has also been largely increased. During the past year have been added 1522 iron coal cars, 76 freight cars, for merchandize and use of road, 1 baggage and 1 new ladies car, 3 second class passenger cars altered to double their former capacities, and 33 eight wheeled coal engine wood tenders

Five hundred and forty-eight wooden coal cars, originally 3 15 tons capacity, have been enlarged to carry 4 65 tons, as alluded to in my last report.

Every locomotive engine owned by the

company, with its maker, present condition, etc., is recorded in statement E, and their cost of repairs and working, in statement F. The repairs of coal, merchandise, and passenger cars, are exhibited in statement G, with the items of wages, materials, etc. The cost of hauling coal for the past year is shown in detail in statement H. It has amounted to 39 39 cents per ton. The chief causes of this increased cost of 1 8 cents per ton over last year, are, the great decrease of coal tonnage from the cessation of business of some of the lateral railroads, in consequence of the freshet in May; and the great falling off in demand for coal in August and September, thus diminishing our business, while the causes were too temporary to justify a discharge of men.

Other causes contributed to the same result: the increased cost of wood—the irregularity in the coal business, by a larger proportion of coal being consigned to the city of Philadelphia, causing engines and their crews to lay over more frequently for want of trains; and the increased cost of repairing engines at night, and over hours, rendered necessary from the failure of delivery of 4 first class engines, contracted for last winter, to be received by June 1st of this year. The cost of transporting passengers and merchandize is contained in detail, in statements K and L. Statement M shows the items of cost of transportation over the State railroad for the past year.

A table of the supply of coal from the various sources in Schuylkill county, with the points on the Reading road to which such coal was consigned, will be found in statement N.

The necessity for adopting and using almost exclusively, anthracite coal for fuel, has engaged, for several years past, the most serious attention of the undersigned. Numerous experiments have been made to burn this staple of the road in its locomotive engines but hitherto without that success which would warrant its adoption in engines of the present build. An engine and boiler for this purpose, invented by the undersigned, on principles entirely new, are now building in the Reading workshops, and with every prospect of success in accomplishing the above result.

**Roadway Department.**—Comprising repairs and renewals of track, bridges, depots, water stations, etc., for the year ending November 30, 1846.

Total cost of repairs and renewal of superstructure of bridges and road bed for the year.

Wages of all laborers, including foremen	\$60,890 11
Wages of mechanics	15,936 45
Iron, steel, tools, etc.	4,837 50
Timber for rewalls and repairs	19,319 49
Clearing snow	887 62
Masonry	4,327 27
Watchmen in tunnels	784 56
Sundries, oil, rents, etc.	3,527 26

\$110,510 26

To which must be added, what would have been the cost of repairing and strengthening of

wooden structures, replaced during the year with stone and iron bridges, . . . . . 4,460 50

Actual cost of repairs of track and bridges . . . . . \$114,970 76

**Engines, Cars, and Stationary Machinery.**  
Transporting, Sawing, and preparing Materials, etc.

Engines, cost of wages, repairs, fuel, etc.	\$7,431 20
Cars, repairs, oil, tallow, etc.	1,204 52
Sawmill, repairs, fuel, attendance etc.	1,006 14
Stationary engines, and other machinery, materials and work,	1,601 00

\$11,242 86

**Water Stations, Depots and Engine Houses.**  
Cost of keeping in order.

Timber, iron, painting, etc.	134 11
Workmanship, masonry, roofing and materials,	890 14
Sundries,	167 49

Total, . . . . . \$1,191 74

**Superintendence and Office Rent.**

Salaries of all officers and agents	3,028 67
Stationery, printing, etc.	247 44

\$3,276 11

**Railroad Iron.**—This item of expense has been in exact proportion to its original quality of make. The total number of bars removed and replaced during the year, has been 1506; of which 1249 were of the 60 lbs. rail, and 257 of the lighter rails, varying from 45 to 55 lbs. per yard—equal to 235 tons. Of these, 185½ tons were relaid in tracks at Reading and other depots and sidings, leaving 49½ tons of iron unfit for main tracks or sidings, worth \$35 per ton as old iron. But the actual cost of these 1506 bars replaced, may be thus stated:—

First\* cost of 235 tons of iron replaced at \$70, . . . . . \$16,450 00

Cr.

By 185½ tons of above, relaid and used, valued at \$50, . . . . .	9,275 00
By 49½ tons valued at \$50, worth as old iron \$35 . . . . .	1,732 50

Deduct . . . . . 11,007 50

Loss on above 1506 bars, . . . . . \$5,442 50

Equal to four-tenths of a cent per ton on the tonnage of the road for the year; which entirely confirms our predictions and anticipations on this subject.

**Watchmen at Bridges and Depots.**

Wages of all watchmen at bridges	9,529 01
Wages of watchmen at Pottstown depots and yard . . . . .	549 32

\$10,078 33

\* This iron was purchased some years since, at less than \$60 per ton.

### Recapitulation of Roadway Expenses.

Maintenance of way, track and bridges, . . . . .	114,970 76
Engines, cars, and machinery, . . . . .	11,242 86
Water stations, depots and engine houses, . . . . .	1,191 74
Watchmen at bridges and depots	10,078 33
Railroad iron, . . . . .	5,442 50
Superintendence and office rent	3,276 11

\$146,202 30

Deduct value of materials on hand, viz:

On hand Nov. 30, '46, 17,367 86

On hand Dec. 1, '45, 14,133 10—3,234 76

Total cost of roadway department for the year, . . . . . 142,967 54

In concluding the report of the Railway Department, I would state, that the road and bridges are at present in excellent order, after passing a tonnage amounting to 1,507,291 tons.

**Construction Department.**—Comprising all expenditures for new work, as stated and explained below.

**Track.**—Including cost of grading, superstructure, and laying down of main and turnout track, at the following points:

	Feet.
At Mount Carbon, for coal cars and workshops, . . . . .	722
Schuylkill Haven, for coal cars and workshops, . . . . .	1,122
Orwigsburg, for coal and wood cars, . . . . .	450
Port Clinton, do do . . . . .	768
Hamburg for coal and freight, . . . . .	813
Mohrsville, for coal cars, . . . . .	2,060
Between Mohrsville and Reading, for coal, lime and ore, . . . . .	1,054
At Reading, for coal and freight cars, coal shutes, wood train, and shops, . . . . .	8,073
Baumstown, for coal shutes, . . . . .	500
Pottstown, for coal and merchandize business, shops, and timber tracks, . . . . .	2,554
Norristown, for coal cars, . . . . .	2,142
Conschocken, for connection with Norristown Railroad, etc., . . . . .	3,445
Between Falls and Plane, part of double track, . . . . .	6,300
At Richmond, on North and Spur wharves, . . . . .	9,942
New Engine House and workshops, . . . . .	3,847
At other points, . . . . .	2,645

Total, . . . . . 46,437

Or 8.79 miles.

Total cost, including iron (except the rails) sills, labor, grading Pottstown yard, making 102,469 cubic yards embankment at Richmond North wharves, and all materials for above new tracks, coal shutes, switches, etc., \$82,172 18.

**Richmond Wharves.**—The northern tier of wharves, hitherto supplied with coal cars by horses, from the siding where left by the engine, at a great cost and delay, have been made to correspond with the new southern wharves. Long and convenient double tracks, of a total length of 8,570 feet, for this purpose, lead upon each wharf, which are worked altogether by locomotives, thus at-

taining the greatest economy and dispatch, when compared with the old method by horses.

A new Spur Wharf, 686 feet long, has been added on wharf No. 14; and new scales, shutes, planking, etc., with all the requisite fixtures, have been laid down on several of the other wharves. Total cost of all above work, \$32,756 19.

**Bridges.**—Under this head are included building stone arches, wing walls, and parapets, under the following bridges, originally of wood: Irish Creek, \$1,890 53; Big Dam, \$10,704 75; Shaeffer's, \$5,535 35; Pottstown Bridge, including nine stone arches and long side walls, \$12,676 04; Phoenixville, \$2,255 43; and Manayunk, \$6,314 60. Of these, five bridges are now nearly completed; and, when entirely so, will be rendered permanently secure, and relieved of all future charges for watchmen and repairs.

Heavy arch pieces have been added to the Falls Bridge, which is now in excellent order.

Total cost, including filling in of earth, \$89,789 25.

**Engine Houses, Depots, Workshops, Water Stations, Reservoirs, and Buildings generally.**—The business of the past season, increasing far beyond the facilities hitherto afforded, under these heads, rendered immediate and extensive additions essentially necessary.

Serious interruptions to the working of the road, involving delays to the coal trade, had been experienced during the past year. Engines have been frozen up and subjected to heavy repairs in consequence of exposure to the weather, for want of engine houses and workshops: great expenses have been incurred at the Reading and other depots, by the employment of a large force of hands, required to change locomotives, freight, wood, and passenger cars on the turnout tracks, between the main tracks and the workshops and freight houses.

The business of the road, and the passage of trains, had been stopped for want of water at one of the principal stations on the line, (since supplied with a stationary steam engine,) and, in some instances, loads of freight have been refused, for some days, at the old Reading freight house, previous to the erection of the present commodious merchandize depot.

The road is now relieved of such delays, and most of their contingent expenses.

One large engine house, capable of holding at the same time, 20 first class engines and tenders, and most conveniently arranged for entering and leaving, watering, etc., has just been completed; as also buildings for the same purpose, of less capacity, but proportioned to the wants of the stations, at Mount Carbon, Pottstown and the Falls. At Reading, where the main workshops of the Company have been located, the following important and efficient improvements have been constructed during the year: A merchandize depot, 124 feet by 84 feet, standing 350 feet from the main track, furnished with doors allowing 11 wagons to be loading and unloading at the same time, and approached

from either end of the line by two tracks forming a Y.

A shop for repairs of iron coal cars and boiler iron work, 104 by 82 feet.

An addition to the main machine shop, 190 feet by 67 feet. A reservoir, holding 700,000 gals. water, supplied by a steam engine, for the use of the workshops and passing trains. A time-keeper's office, water and wood stations, &c.

The stations at Port Clinton, Mohrsville, Douglassville and Pottstown, have been furnished with an ample supply of water, by stationary engines, worked at trifling expense from the refuse fuel of the stations; at which points large and convenient wood sheds and cisterns have been also erected.

Efficient workshops, connected with the engine house, 221 feet by 63 feet, have been built at Richmond, for repairing and refitting engines and cars at that terminus of the road; and at Pottstown, where the work of the Road Department is chiefly done, spacious shops have been built, one 151 by 81 feet.

The road will therefore commence the business of the coming year, with facilities for every branch of its operations of the most ample character, requiring a trifling, if any, future expenditures.

Total cost, \$123,727 24.

**Transportation of Materials.**—Including wages of men, fuel, oil, water, repairs of engines and cars, and all expenses of transporting materials for Construction Department along the line, such as stone, timber, brick, iron, etc., etc. Total cost, \$15,840 36.

**Vertical Walling.**—Expenses of completing Valley Forge walls, and rebuilding walls at Falls, rendered necessary by use of double track, \$8,081 42.

**Iron Bridges.**—Including construction of 6 bridges, built with the "Howe" iron truss, in all 220 lineal feet; and 3 bridges now making, of 187 lineal ft. Am't. \$15,439 47.

**Tunnel Arching.**—Of Pulpit Rock Tunnel, at Port Clinton, roofing 180 feet. Cost, \$6,700 44.

**Machinery, Turning Platforms, and Hardware.**—Including new lathes, boring mills, drill presses, tilt-hammers, vices, and tools of all descriptions, for shops at Schuylkill Haven, Reading, Pottstown, and Richmond. Files, wrenches, anvils, leads and paints, etc., etc., in amount \$38,538 78.

**Lumber.**—For yard and depot, fencing, sills and frames, wood sheds, etc., etc., amounting to \$13,041 67.

**Sundries.**—Switch watchmen, during construction of stone bridges, stationery, and all items not included in above heads, \$4,862 95.

The limits of this Report prevent a more detailed explanation of the various heads of expenditure of the three departments. Should any further information be required, it can be readily furnished from office notes carefully recorded.

I am, most respectfully,

Your obedient servant,

G. A. NICOLLS,

Engineer and General Superintendent  
Philadelphia and Reading Railroad.

READING, Pa., December 1, 1846.

# Recapitulation of Expenditures of Construction Department for the year.

Track,	\$82,172 18
Richmond wharves,	32,756 19
Bridges,	89,789 25
Engine houses, depots, workshops, and water stations,	123,727 24
Transportation of materials,	15,840 36
Vertical walling,	8,081 42
Iron Bridges,	15,439 47
Tunnel making,	6,700 44
Machinery, including turning platforms, etc.	38,538 78
Lumber,	13,041 67
Sundries,	4,862 95
Engineering Dep., salaries, office expenses, stationery, etc.	8,163 87
<b>Total,</b>	<b>\$439,113 82</b>

## Statement A—Business of the Philadelphia and Reading Railroad, for the year ending Nov. 30, 1846.

TONNAGE.	
Coal transported, tons of 2240 lbs. ....	1,188,258
Merchandize transported, tons 200 lbs. ....	74,971
Materials for use of Road, including earth, gravel, timber, rails, sills, cord wood, stone, brick, iron, etc., in tons of 2000 lbs. ....	101,471
Total tonnage of Road for the year, including weight of passengers, in tons of 2000 lbs. ....	1,515,473
Total amount of Coal transported to date, tons of 2240 lbs. ....	2,693,975
Total tonnage of road to date, tons of 2000 lbs. ....	3,703,521

PASSENGER TRAVEL.	
Total number of passengers during the year .....	88,641
Total number of miles travelled by the same .....	4,154,214
Equal to, in through passengers, over whole length of Road .....	45,155
Total number of passengers transported, to date .....	551,953

RECEIPTS OF ROAD.	
From freight on Coal .....	\$1,600,667 09
" " Merchandize .....	137,543 52
" " Passenger travel .....	141,749 07
" " Transportation of U. S. Mail, and other sources .....	9,713 84
<b>Total receipts .....</b>	<b>\$1,889,713 52</b>

## Statement B.—Gross Expense of Transportation Department, for the year ending, Nov. 30, 1846.

RUNNING ACCOUNT.	
Wages of engineers, firemen, conductors, brakemen, despatchers, time-keepers, oilers and turning screws ..	\$105,628 27
Wood, 60,006½ cords .....	166,643 12
Loading and unloading wood, wharfage, agents, &c. ....	13,044 35
Cutting wood .....	22,374 82
Oil, 45,672½ gallons .....	38,819 26
Tallow and grease, 40,162 lbs. ....	2,990 44
Hauling across Schuylkill Bridge on State Road, and expenses on ditto, in Philadelphia .....	1,794 33
Tolls paid State Road .....	28,643 50
Coal left short of consignment and used by Company .....	1,178 07
Renewals of articles on trains, lamps, ropes, etc. ....	5,459 78
Cotton waste .....	1,877 75
Coal fuel for engines .....	1,136 16
Sundry goods lost or stolen, etc. ....	1,496 68
<b>Total .....</b>	<b>\$391,086 53</b>

EXTRAORDINARY EXPENSES.	
Salaries of 3 agents on lateral railroads, apportioning and distributing Coal cars .....	\$2,641 38

## WORKSHOP ACCOUNT.

Wages of all machanists, blacksmiths, carpenters, boiler-makers, moulders, time-keepers, and all mechanics and laborers.....	\$120,230 32
Bar iron, steel, tools, and hardware....	31,679 56
Tires and axles.....	14,325 07
Pig metal, iron, lumber, hay, etc., for foundry.....	10,030 92
Copper, spelter, tin, lead, etc.....	5,206 14

**AMERICAN RAILROAD JOURNAL.**

Published by D. K. MINOR, 105 Chestnut St., Philadelphia.

Saturday, February 13, 1847.

**INDEX FOR 1846.**

The Title Page and Index for last years' volume were mailed with the Journal (No. 5) for Jan. 30th.

**Reading Railroad Report for 1846.**

We continue in this number, this important report, which was commenced in our last. It is, as last year, full and explicit. By referring to the report for 1845—see R.R.J. of March 14, 1846, page 170—it will be seen that the gross receipts for transportation, of all kinds, in 1845, were \$1,060,381; and the estimate for 1846 was, \$1,725,000—being an increase over the year 1845, of \$664,619; and by referring to the report now published, it will be seen that the receipts for transportation during the past year are \$99,713, or \$164,713 more than the estimate of the managers, and \$829,332 greater than in 1845. It will also be seen that the ability of the company, for increasing its business hereafter, will be in proportion to the increased demand for coal, if the shareholders act judiciously. In 1845 they had 54 locomotives and 3104 cars for coal; and now they have 72 locomotives—most of the new ones are of the largest and most improved class—and 4559 coal cars—mostly of iron, averaging 4-7 tons each; and all the other improvements of the company are of an equally permanent character, and upon a plan equally extensive.

It appears that 1506 bars—or rails—equal to 235 tons of iron—have been removed from the two main tracks during the past year—of which 185½ tons, valued at \$50 a ton, have been relaid in side tracks, and at depots along the line; and the balance, or 49½ tons disposed of at, or is worth, \$35 a ton—showing a depreciation on this amount of \$11,007.50, and equal to four-tenths of a cent per ton on the entire tonnage of the road for the year.

Iron bridges have, it seems, been introduced with entire success, and the old wooden structures are being renewed with stone, as they require to be rebuilt; and we do not hesitate to say that the day is not distant, when anthracite coal will be used instead of wood in their locomotives, as we learn that a plan of engine has been devised by Mr. G. A. Nicolls, the engineer of the road, which promises success.

Great improvements have been made at the Richmond—or Delaware river—depot. A spacious new engine house and machine shop have been erected

there; and, indeed, the road is in every respect prepared for doing an increased business the ensuing year, without any material addition to the machinery.

The net earnings of the road for the year were \$1,037,795.21, and the balance, after paying interest on loans, taxes, etc., was \$402,202.29—an amount which, if divided among the shareholders, would give them upwards of 12½ per cent. on the \$3,120,000 of stock issued—but it seems that the company have decided—and wisely, too, we think—to reserve this fund for the increase of machinery, and to pay off the loans as they fall due, and thus reduce their liabilities; and in lieu of making dividends in money, it is proposed to issue new stock to the shareholders for the amount.

It is peculiarly gratifying to us, and to many others, we are sure, to see this noble work—which has done so much, within the past three years, to cheapen fuel—thus assuming its proper position—to see it showing what may be done on a railroad properly constructed, and managed with spirit and energy.

A comparison of the business of the past two years will enable the candid observer to estimate, pretty accurately what will be the business of the current and following years. It needs not the foresight of a prophet to predict that the most sceptical on the subject, will, at an early day, be compelled to acknowledge that this road is without a parallel in the world. Its peculiar position, and the rapidly increasing consumption of coal, and manufacture of iron on its line, will always insure it an amount of business without a parallel. The great difficulty will, hereafter, be to increase its means of performance in a ratio with the demands upon it, unless early measures are taken to lay down a third track. It will not only have the business of its own region, but it must also receive large accessions of business from the interior of the State, and ultimately from the lakes, by the way of the Erie and Sunbury railroad.

It was predicted by many, ten years ago, that the Reading railroad would never be completed, and by others that, if completed, it would not pay a fair interest on its cost; yet we see that it has been completed, and, though only in its infancy, has earned more during the past year than six per cent. on its enormous cost; and we shall see more; we shall see, when it has a third track, and within ten years, that it will divide over eight per cent. on fifteen millions of dollars. This, it may by some be said, is another prediction; it is a prediction, however, which will become matter of history in a few years. We therefore again suggest to the rival companies, which are about to contend for the trade of the Schuylkill valley, that they come to an amicable arrangement in relation to the rates of transportation, and that they charge a price which will give each a fair return upon their investment. In such a course the coal consuming community will, we are quite sure, cheerfully sustain them. It is very evident that the increase of business in the Schuylkill valley, and its tributaries, will, in a very few years, require facilities beyond the present capacity of both works. Let them, then, adopt such a course as will be just to themselves and liberal to the community.

**Bridge over the Illinois.**

The Legislature of Illinois have passed a bill providing for the erection of a bridge across the narrows at the foot of Peoria lake, at the city of Peoria. This bridge is to cross at the place where William L. May now keeps a ferry, and will be of incalculable

able advantage to the city of Peoria, as well as to all the country surrounding it. Ample provision is made in the law to protect commerce, and insure a safe passage for every description of water craft.

#### Another Rally.

The last number of the Portland Advertiser says, that: "Another unexpectedly large and enthusiastic meeting last night, at the City Hall, placed the crowning consummation upon our adventure in the Lewiston and Waterville Railroad. Accidental circumstances retarded this result a few days—though it was abundantly pledged and assured—and last evening, on the final report of the Subscription Committee, a warm and substantial interest displayed itself. With most encouraging applause, the subscription of PORTLAND was carried up to one hundred thousand dollars, and a considerable sum beyond."

#### Anthracite Coal Market.

The "Ledger" states that the stock of coal east of New York is very small indeed, scarcely equal to the wants of consumers. In New York the supply, considering the soft, weather, is about sufficient.—Dealers begin even to think of having some left over. They find that foreign coal, which is abundant, and more arriving as ballast in almost every ship from England, very seriously interferes with the sales of anthracite. The best English lump coals are sold in New York at \$7 per chaldron of 36 bushels, 2800 lbs. Anthracite is \$6.50 per ton of 2000 lbs. (cartage extra in both cases.) For the same weight, viz: 2000 lbs., the price of English coal is \$5. Pictou coal is very dull at 50 cents less. This disparity will readily lead to the conclusion that the foreign articles must seriously interfere.

In Philadelphia, and along the line of the Schuylkill, consumers are supplied chiefly as wanted, there being no accumulations. But the wharves at Richmond are being filled up with coal very fast, waiting the opening of the spring trade. The coal market was never perhaps in a more healthy condition.

#### Illinois Canal.

The Sangamo Journal, of the 14th instant, states that since this work has been under the new direction, 604,000 dollars have been expended upon it, and that the estimate for its completion exceeds, by a trifle, 707,000. The Journal says further: "The bondholders will be able to finish the work for about 1,300,000 dollars—being about 300,000 less than the original estimate; which it is believed will be effected by September of the present year. The canal has a surface of 60 feet and a depth of 6 feet. The Illinois river during a good part of the past season has had but little more than two feet water upon its bars—rendering its improvement (to realize all the advantages which we have anticipated from the canal) absolutely necessary."

#### Railroad Scales.

One of the singular results of the great improvements in transportation by Railroad and Canal, is the invention of Scales of enormous capacity. Messrs. Ellicott & Abbott, of Philadelphia, advertise Scales "for weighing loaded cars in trains or singly." They say:

"The levers of our scales are made of wrought iron, all the bearers and fulcrums are made of the best cast steel, laid on blocks of granite, extended across the pit, the upper part of the scale only being made of wood. E. Ellicott has made the largest Railroad Scale in the world, its extreme length was one hundred and twenty feet, capable of weighing ten loaded cars at a single draft. It was put on the Mine Hill and Schuylkill Haven Railroad. We are prepared to make scales of any size to weigh from five pounds to two hundred tons."

#### American Railroad Matters.

The citizens of Waterville, Me., had another crowded rally on the 23d ult., in reference to their railroad. The town hall was filled to its utmost capacity, and nothing, it is said, could exceed the spirit and enthusiasm of all present. Eloquent and able speeches, of an animating and encouraging nature were delivered, and the speakers were continually interrupted by the loudest bursts of applause. The books being opened, the citizens, most of whom had subscribed very liberally before, stepped forward one after the other, and amidst shouts of approbation, made each a generous increase to their subscriptions. In the course of a very brief time, the sum of ten thousand dollars was added to the amount already on the books. The whole actual subscription for the upper road now amounts, as far as we can learn, says the Gardiner Blade, to about \$400,000—the sum with which the corporators have voted to break ground. There is no doubt that the work will be commenced in the spring, as early as the snow will permit.

The following table exhibits the healthy condition of the Boston and Albany road. The receipts are upon freights shipped from the East Albany depot. The aggregate income of the road, for the past 12 months, exceeds one million of dollars. The amount collected on freight forwarded from East Albany from January 1st, 1843, to December 31st, 1846, is as follows:

1843.	1844.	1845.	1846.
\$167,057 12	\$223,572	\$268,450 06	\$312,940 13
The increase of 1844 over 1843 is.....\$56,484 88			
The increase of 1845 over 1844 is.....44,878 06			
The increase of 1846 over 1845 is.....74,490 07			
The increase of 1846 over 1843 is.....175,853 01			

By the above it will be seen that the average annual increase for the last three years is nearly 40 per cent., and for the year 1846 over 1843, upwards of 100 per cent.

The city council of St. Louis, Mo., has passed resolutions asking permission of the legislature to borrow half a million of dollars on the faith of the city, to be loaned to a company to be formed for the purpose of constructing a railroad from St. Louis to the Ohio, with a view to a future connection with the Baltimore and Ohio railroad, or to some point on the lakes. The resolutions are to be transmitted to each of the Governors of the States of Missouri, Illinois, Indiana and Ohio, with a request that they be laid before the respective legislatures thereof; and also to each of the Mayors of Springfield, Cincinnati, Columbus, Pittsburg, Baltimore, Philadelphia and Boston.

The Cheshire railroad has recently contracted with Davenport & Bridges, of Cambridgeport, Mass. for six first class passenger cars, three second class and passenger baggage cars, and 100 freight cars to be delivered in July. A contract has been made with the Central railroad by the same well accredited builders, for a like number of passenger and freight cars to be delivered next fall. They have also contracted with the Northern, Concord, and other railroads now constructing or increasing their power and means of transportation, for cars to the amount of \$125,000.

The Boston Post says, "the work turned out by Messrs. Davenport & Bridges, speaks decidedly in their favor as skilful and faithful mechanics, whose vicinage to this city—the grand centre of railway movements—is an important advantage both to them and to railroad agents."

The Nashua and Lowell railroad company's petition for authority to construct a railroad in New Hampshire, has been summarily disposed of; but

the great questions of Danvers and Maine railroad connecting lines and the conflicting "air lines" to New York, cannot be thus easily pushed aside.—The Worcester railroad has recently issued a manifesto upon the subject of its branch to Milbury, or the germ of a line to Blackstone. Its Newton Falls line is now in operation.

The petitions for new railroads and branches to existing lines pour into the Massachusetts Legislature, who have a prospect of a long session, if all be fully and impartially heard.

The Albany Evening Journal is informed that Mr. Witt, the freight agent, sent off, one morning last week, 166 cars laden with flour, pork, etc., for the east. This is the largest train ever sent off in one day during the winter. The amount to be collected on them was \$3,101 93—a pretty good business for one day.

The stock for a branch from Old Colony railroad to Milton, has been subscribed. It is three miles long, and expected to cost \$60,000.

A proposition is now seriously entertained of a lease, by Maine and Eastern railroads, of the Portsmouth and Portland at six per cent., which has rushed the stock of the latter in a twinkling up to 98. A meeting of the stockholders was to be held on the 10th inst., "to decide if they will lease the road."

The earnings of the Michigan Central railroad in two months and six days, to December 1st, were \$99,550, or at the rate of \$510,834 per annum upon a cost of \$1,600,000. We learn that its cars are contracted for in its vicinage. The engineers have found the route from Kalamazoo to New Buffalo so favorable that it has been determined to run the road in a straight line through.

The works on the Providence and Worcester railroad are rapidly progressing, and will be open for trial by July next.

We are informed that the trustees of the Bath Academy have voted to subscribe \$2000 to the stock of the Portland, Bath, and Kennebec railroad.

The subscription to the Kennebec and Portland railroad is going on fairly. The Brunswick paper states that \$46,000 had been subscribed in that town, previous to the 23d ult., to the Kennebec and Portland road. Brunswick and Topsham were assessed \$60,000. Freeport had come up to \$13,000, being 3,000 more than her assessment. In Vassalboro', \$10,400 had been subscribed up to Friday last, and the returns not all in. This town was not drawn upon by the Directors in the apportionment of the \$500,000 to be raised on the route previous to the commencement of the road. Sidney has also subscribed upwards of \$10,000. At a meeting of the Directors in Brunswick, on Thursday of last week, returns were received of \$490,000 of the \$500,000 required on the route; but all the papers were not forward to them. It is known that the actual amount is much larger than this. (These subscriptions are exclusive of over \$250,000 subscribed out of the State.) The Directors determine to go ahead immediately.

We find the following table in a Massachusetts paper, and give place to it partly for the purpose of indicating the regularity with which, after the distance of six miles is attained, the rate of fare is placed at two and a half cents per mile, as near as may be for all distances, and also to show the names of the towns—not one of them known or distinguished for large population—through which this road is laid—a road, the stock of which is the highest with one exception, in the country. It is largely patronized of course, from the country beyond its interior

terminus. This road is now petitioning for leave to establish a depot in Boston.

Table of Distances and Fares over the Boston and Fitchburg Railroad.

From Boston to	Miles.	Total.	Fares.
Somerville .....	2	2	12½
Porter's .....	1	3	12½

Fitchburg .....	5	50	1 25

Usual time from Fitchburg to Boston, 2½ hours.

#### St. Lawrence and Atlantic Railroad.

We are happy to learn, as we do, from good authority, that this road is getting on as well as is possible this winter. Our informant says that the progress is not so rapid as might be wished—in consequence of the snow, and light quality of work, on the "1st division"—but, adds the writer, "when Spring lets us get out once more, we will make up for lost time. Everything looks prosperous for our road, as well as for the Montreal and Lachine road. We are to have a Magnetic Telegraph from Montreal to Toronto, which will connect us with Boston, New York and Philadelphia, and it is in itself but a forerunner of a railroad from this city to the same place, to connect with the Great Western railroad, now in progress from Hamilton, west. We are likewise to have a Telegraph from Montreal to Quebec, and from thence to Halifax; so that we shall soon be able to give you the news by the steamers in advance of everything, and by way of Quebec, Montreal, Toronto, Buffalo and Albany; something of a roundabout way, to be sure—but it will answer every purpose.

"The St. Lawrence river has closed over at length to remain so, I hope, until Spring. The prospects for a bridge over the St. Lawrence are, I am happy to say, very flattering; and there remains but little doubt in the minds of the many, that the bridge will be constructed in spite of all obstacles. It is a gigantic project, and if successful, will be a lasting monument of the civil engineering of the 19th century. We have plenty of snow in this part of the world, and some cold weather; so cold that it would make some of the goodly inhabitants of your city wonder if they were to experience it. The thermometer this morning was only at 10 degrees below zero, but has been down (in Quebec) as low as 20 degrees, I believe, this winter. The new Governor General of Canada, Lord Elgin, is to arrive here to-day. He is a firm friend of internal improvements, so it is understood, and will place no obstacle in the way of the many improvements that are at present in prospective."

#### Atlantic and St. Lawrence Railroad.

At a meeting of the members of the St. Lawrence and Atlantic Railroad Company, held in Montreal, on the 30th ult., a report was made by the Directors, from which we copy the following paragraph regarding the Lewiston and Waterville railroad enterprise:

"The board has received the pleasing information of a charter having been granted by the State of Maine, for the construction of a railroad branch from the great artery at Lewiston, about 30 miles this side of Portland, to Waterville, on the Kennebec river; and the requisite stock for the organization of this company having been subscribed, the

work is to be commenced forthwith. A charter has also been granted for the extension of this road to Bangor, one of the largest and most thriving towns in the State, which will undoubtedly be commenced soon; and a further extension of the line is contemplated in the direction of New Brunswick. This will not only open an extensive market for western produce passing hence over the St. Lawrence and Atlantic railroad, but it will give to Canada a direct and expeditious communication with the lower provinces."

#### Anthracite Coal Trade.

We lately published from the Cumberland Civilian, some interesting statistics connected with the coal region, trade, etc., of Maryland. The Miners' Journal, of Pottsville, Pa., on Saturday week, comes to us nearly filled with reports, statistics, and general information concerning the great anthracite coal region of Pennsylvania, its trade, business, facilities, prospects, etc. From these we gather, that the amount of anthracite coal sent to market during the year 1846, was, 2,343,992 tons, being an increase over the previous year of 320,940 tons; that of this amount, Schuylkill county alone furnished 1,295,928 tons, which amount was almost entirely transported over the Reading railroad, the canal of the Schuylkill Navigation Company, (until within the past five years, furnishing the only means of sending coal to market from this region,) having been closed nearly the entire season in undergoing enlargement and improvement of its capacity, in order to an increased business the ensuing year, and hereafter.—Its present capacity is for 180 ton boats, formerly for only 60 to 65 tons. Since the commencement of the trade in 1820, when 365 tons was the amount produced, there have been an aggregate amount of 15,811,204 tons sent to market, of which Schuylkill county alone, since 1825, when its trade commenced, has furnished the proportion of 8,629,746 tons more than all other places added together.

There are 110 operators in this region, of whom 14 produced and shipped over 30,000 tons each; some of these as high as sixty odd thousand; 9 over 20,000 and under 30,000 tons; and 9 over 10,000 tons and less than 20,000. The total number of collieries within this region are 142, of which 107 are above water level, and 35 below. There are already 51 coal breaking machines in operation by steam power, where but two or three years since all coal was broken by hand, with the hammer.

There are 105 stationary steam engines employed in hoisting and breaking coal, varying in capacity from 10 to 90 horse power each, making, together, an aggregate power of 2,921 horses, or equal to the labor of 14,505 men, estimating five men as equal to one horse power.

Of railroads and canals connected directly with the anthracite coal trade of Pennsylvania, there are already completed of the former, 478 miles, including an estimated amount of 60 miles under ground; and of the latter, 417 miles—forming together an aggregate cost of \$33,920,000. Of this amount the Reading railroad alone, with its cars and locomotives, are put down at \$11,000,000; and the Schuylkill canal, enlarged, \$5,675,000. The Reading railroad has upon it, and in connection with it, 71 locomotive engines, and 4,549 coal cars, of which 3,020 are iron, and 1,539 wooden cars; besides 489 cars for merchandize and use of the road, and 17 passenger cars.

The product of coal from the Schuylkill region, it is supposed, will be largely increased the coming year, in consequence of the canal being completed and ready for operation so soon as the season opens.

#### Central Railroad.

We learn with pleasure, that the amount of subscriptions to the Pennsylvania Central Railroad, necessary to secure the Charter, have now nearly or quite been made up, and the Committee, in whose charge are the lists, will be ready to make their report at an early day. We have believed, from the first broaching of this great scheme, that the advantages to be derived from the consummation of this project, must prove of incalculable benefit to the city of Philadelphia—and were our citizens to subscribe individually, or were the city itself, in its corporate capacity, to subscribe for double the amount now asked for—upon which, in the shape of dividends, they should not receive the first cent—still, in our judgment, both our city and our people would realize a benefit, indirectly, from the establishment of this road, which would pay roundly for the outlay. This is our belief, and we hope to see the work pushed forward without unnecessary delay. The plan is immense, and we cannot but believe that the result will, in the end, prove proportionately profitable. In connection with this subject—we publish below—an article which we find in the *New Orleans Bulletin*, of the 28th ult., and which cannot fail to be read by the citizens of this State with deep interest. "As a business transaction," very correctly remarks a cotemporary, "this road is truly a master-stroke of policy." The "Bulletin" says:—

Among all the works of internal improvement that have been made or projected at the North, for the purpose of attracting the commerce of the West, there is none more calculated to injure New Orleans, and to benefit the projectors, than the Pennsylvania Central Railroad.

This work is to be a continuous Railroad, connecting Philadelphia and Pittsburg, and with the ulterior object of continuing it on to Cincinnati. The subscription we see is completed, and the work will now go on promptly and rapidly. In the discussions that have been had on the subject in Philadelphia, we observe that great stress is laid upon the probable quantity of travel over the road—this is of high importance to the stockholders, and will no doubt add greatly to their profits, but is a matter of indifference to us in New Orleans—it is the TRADE that it will divert from us, that we are to look to, and which should attract our attention.

We have hitherto been sleeping in New Orleans, on the subject of the Western trade—we are still sleeping, and in fancied security, are dreaming that our natural advantages are such, that nothing can divert the trade from this city—that God Almighty has done everything for us, and that we need not make any exertion for ourselves—it is a great, and if persevered in, will prove a fatal error, and we shall waken up some of these mornings and find the whole of that immense and rich commerce is flowing almost *en masse*, over the mountains direct to the Atlantic cities.

The natural advantages of New Orleans, are undoubtedly great, and particularly in the free navigation of the Mississippi and its tributaries, unburthened with tolls, to which the artificial works will always be subject; but then, these advantages are not altogether unincumbered—the navigation of the Ohio is interrupted by ice in the winter, and low water in summer. The produce is subject to

double freights, insurance and shipping charges, if to be sent coastwise, from New Orleans, and increased freight above the rates from the Atlantic ports, if destined for Europe.

We have already seen the immense diversion which the New York and Pennsylvania canals have made from the commerce which legitimately belongs to New Orleans—a diversion which is annually increasing and extending its sphere of operations. Cotton loaded boats from the Tennessee and Cumberland rivers, and tobacco and flour laden ones from St. Louis, are already to be seen stemming the current of the Ohio, with cargoes destined for New York, by the Ohio canal and the Lake route, or for Philadelphia, by the great Pennsylvania canal. These lakes and canals, however, are frozen in winter—frozen earlier and later than the river, which prevents a large additional quantity of produce from going by those routes, and causes it to come to New Orleans during the winter, (if an open one, like the present) or by the early Spring rise. Philadelphia, however, has determined to overcome this disadvantage, by the construction of a railroad that will, at all seasons, afford a certain and cheap conveyance to her store-houses of the various productions of the teeming West.

The produce that accumulates on the upper portion of the Ohio, during the low waters of summer and autumn, is shipped to New Orleans, by the first fall rise; and that which collects during the winter comes down on the opening of the navigation in the spring; but whilst our intercourse is thus suspended from the above causes, Philadelphia, by this new road, will be drawing these accumulations to her own warehouses. Even if this road was to terminate at Pittsburg, the injury to us will be great, but it will, as a matter of course, be extended to Cincinnati, and no doubt in a very few years be continued through Indiana and Illinois to St. Louis; each mile it is extended, renders it more desirable and advantageous for every section of the country to be connected with it; when once it reaches Pittsburg, Cincinnati will, of course, lose no time in placing herself in direct communication with the Atlantic.

One, among other obvious results, of a railroad from Cincinnati to Philadelphia, would be to deprive New Orleans of nearly the whole of the immense pork and lard trade, for, with this railroad existing, the hogs, after being killed and dressed in Cincinnati, will, in that state, be placed in cars, and in 36 or 48 hours will be in Philadelphia, where they can be cured at the same expense, and are at market by a land route of about 500 miles, instead of a double voyage by water of 3000 miles, saving double freights, double insurance and charges; the transportation is also saved on the barrel, salt and brine, the weight of which is at least one-half that of the meat; the article is at market in November and December, instead of April or May, whether it is intended for home consumption in the Atlantic ports (to which the largest portion of the pork is shipped from N. Orleans) or in foreign markets.

The freight by this railroad route to Cin-

ninnati, would not exceed half a cent per pound, which, (as it is paid only on the actual weight of the meat) would be only one dollar per barrel; and the whole cost of delivering it there would be much less than one-half at which it could be done via New Orleans.

We received, last season, in New Orleans, 47,303 hhd., 369,601 bbls. and 10,233,452 lbs. in bulk of pork, and 107,639 bbls. and 334,969 kegs of lard; and the loss of even one-half of this item of pork in the trade of the city, would be no trifling matter.

Though we have cited Pork (as being a prominent article of produce in the commerce of New Orleans) to show the injurious effects from the exertions that are making to divert the trade of the West from our city, they will have a like effect on the other leading articles, and will also greatly injure us in the supplies which we furnish to the West. This movement on the part of Philadelphia is a master-stroke of policy, for it gives her a double hold on the trade by both Canal and Railroad, keeping up a constant intercourse at all seasons and under all circumstances, and affording her great advantages over all her neighboring cities; we consider it the most important measure which that city has ever adopted to promote her permanent prosperity; and we have called attention to it that our citizens may be aware what is doing elsewhere calculated to affect the interests of New Orleans so injuriously, and that they may be prepared to suggest and adopt some measures of counteracting effect. We should recollect that it is not only one city, but that all the great commercial emporiums on the Atlantic are engaged in this struggle; and whilst they are all thus striving in zealous rivalry with each other, they are in fact unitedly working against New Orleans—as it is the natural and legitimate commerce of this city, which they are each separately endeavoring to appropriate to themselves.

#### Norris' Locomotive Steam Engine.

It must be peculiarly gratifying—says the last number of the New York Farmer and Mechanic—to every friend of his country, to observe the rapid progress of the mechanic arts, and the almost unrivalled combinations of skill and enterprise exhibited by many of her noblest sons, whose well-earned laurels, and increasing reputation, not only in our own land, but also abroad, so deservedly render their names a rich inheritance to the country of their birth and operations. To such men we look with an honest and heartfelt pride, and cannot but feel that to them we owe far more of real glory and true excellence, as a nation, than all the achievements of conquest could ever produce.

Among those to whom we are indebted for many of the most excellent specimens of American skill and well directed enterprise, and those which have attracted almost universal admiration abroad, none perhaps, at the present day, stand more conspicuous than William Norris, Esq., of Philadelphia, whose well known superiority in construction and excellence of workmanship, entitle his LOCOMOTIVE STEAM ENGINE to a more than passing notice.

The several valuable improvements which he has introduced in the construction of his engines, their great economy in regard to fuel, being adapted to anthracite, bituminous coal, coke, or wood, their

simplicity, and consequent small amount of repairs, and the facility with which such repairs may be made, together with the most perfect adjustment of the working parts, and the introduction of the "composition metal," by which a great saving in the amount of repairs is effected, combine so many desirable advantages, that we are almost at a loss which most to admire, their superiority of construction, their beauty of workmanship, or their speed and steadiness of motion.

Mr. Norris has also introduced the manufacture of locomotives of eight wheels, having the adhesion of four, on a new and improved plan, with the weight on the four equalized; (of all the various dimensions, classes, etc.) of a superior description, and which are attracting much attention.

In addition to the numerous orders which Mr. N. has filled for almost every State in the Union, he has furnished engines for England, Prussia, Austria, and other countries in Europe, all of which have given the highest satisfaction, and, judging from the numerous commendatory letters which these have elicited, from the agents of these governments, (some of which we have had the pleasure of perusing) they have been received even with enthusiasm. The following certificate of the Directors of the Vienna and Raab Railroad Company, Austria, as translated from the German, we give as a specimen of others. The Directors say:—

"The Locomotive Steam Engine ordered and received from the manufactory of William Norris, Esq., of Philadelphia, U. S., called the "*Philadelphia*," has completely succeeded in the performance required at her trials, and on a temporary Railroad, where there exists curves of 300 feet radius, with an elevation of two per cent. and more, the "*Philadelphia*" ran with all possible security and most extraordinary speed.

"The superior quality of these Engines, as well as the simplicity of their construction, the great facility of producing steam, their easy management, and particularly their economy in fuel, compared with the Engines built in England, etc., was the inducement of the Vienna and Raab Railroad Company to order more of these machines; and we do, with the greatest satisfaction, recommend them sincerely to all other Railroad Companies, which will require Engines.

(Signed) JOH. BARON DE SINA,  
IGNAS BARON DE DOLHOFF,  
Directors of the Vienna and Raab Railroad Co."

The following extract from the *London Mining Journal* of June 1, 1839, although it has before appeared, will be read with interest. It refers to the trial engine sent over by Mr. N., for the Birmingham and Gloucester Railway. The *Journal* says:

"As some doubts were entertained as to the correctness of the representations made, respecting these Engines, we have pleasure in giving the following particulars as to the Engine sent over to this country by Mr. Norris, and the work it has actually performed on the Grand Junction Railway, in conformity with the agreement to which we have alluded. The "*England*" weighs about eight tons, without water or fuel; she is also built much lower and smaller than the Engines commonly in use here, and has six wheels, the driving pair being four feet in diameter. The cylinders are ten and a half inches in diameter, and are enclosed in proper cases to prevent radiation—stroke eighteen inches. The machinery is of the simplest construction, and consists of a much smaller number of parts than we have been accustomed to see. The cylinders are placed on the outside of the framework, which allows the advantage of a straight axle, and the general appearance of the Engine more nearly resembles that of the old "*Rocket*" Engine than any with which we are acquainted. The Engine is got up in a most superior style, and is finished even to the most minute particular in a very beautiful and workmanlike manner, every part having been executed with perfect accuracy by means of self-acting machinery."

**Boston Railroads.**

A writer in a late number of the New York Commercial Advertiser, has the following in relation to the Boston railroads. It will be seen that all the railroads radiating from Boston, there is none which has not exceeded in its amount of traffic even the most sanguine anticipations of its friends. The fact that these roads carried in 1845 a number of passengers *three times as large as the population of Massachusetts*, will be quite surprising to those who have never seen the statistics on this subject. The statements of the writer are another proof of the well known fact that railroads *create* every where more travel than they at first *accommodate*. The remarks on the comparative advantages of railway and water conveyance are commended to the attention of such as are moved by the matter of steamboat competition.

Boston, Jan. 15, 1847.

In my last some account was given of the line of railroad between this city and Albany. It is now proposed to give some further statistics which go to show how far the actual result of the traffic on the railroads in this vicinity has exceeded the original estimates formed by the projectors in their commencement. Taking the Lowell, Worcester and Providence railroads, the freight business of 1845 exceeded the original estimates from three to five times, and the passenger business from six to nine times. These roads, together with the Eastern railroad, were all in operation in 1840, the latter having been opened in autumn of 1839. Their aggregate length is 160 miles. Their total aggregate receipts were

In 1840 .....	\$900,857
In 1846 .....	1,557,462

Showing an increase in five years of 72 per cent. or an annual average increase of 14 1-2 per cent.

The average receipts for the year 1845 were about \$9,500 per mile of road.

It appears that the increase in the traffic has been greater on passengers, as compared with the original estimates, than on freight. This may be said of railroads generally.—When first opened for general traffic, it was not supposed that they would reach a greater speed than 12 to 15 miles per hour; but it was soon discovered (in the progress of improvements in their construction, and in locomotives,) that a higher speed would be attained; and trains of passenger cars now move on most of the roads in this vicinity with a running speed of 25 to 35 miles per hour, exclusive of stops to take in wood and water, and to receive and discharge passengers; or the speed, including all stops, may be taken at 22 to 28 miles per hour. On well constructed roads it has been shown by experience that a speed of 30 miles per hour (including two stops) is a pleasant and agreeable motion, and may be maintained without any extraordinary expense.

It appears from official documents that the six railroads radiating from Boston, carried in the year 1845 about 2,400,000 passengers, which is nearly three times the population of the state. This great number of passengers is the result of the great facility the road affords in the ease, safety, certainty and speed of transit.

It can no longer be doubted by any man who will examine the subject with candor, that for all transportation requiring celerity and certainty, the railway is superior to the best water conveyance. With a moderate velocity, a vessel is easily propelled through water; but to increase the speed, produces an increase in the resistance of the water, equal at least to the square of the velocity. That is, a boat moving 20 miles per hour, requires at least four times the power that would propel it 10 miles per hour. Hence the great increase of power required to raise the speed of steamboats. A man will run through the air with very little resistance; but how fast would he run through water? The rail car moves through air, having no other difference except the friction, which requires one pound to move 270 pounds. A little reflection will convince any sensible man that steamboats can never compete with good lines of railroads for speed.

Viewing their superiority for the conveyance of passengers, or whatever requires high speed, with their capacity for every kind of transportation during the winter, (when rivers in this climate are closed) their great importance to our social, as well as our commercial interest, is obvious to the least reflection.

This city has largely reaped the benefits of this improvement, as also the country through which the railroads pass. To them it has truly been "an epoch," giving new vigor to every species of industry.

**Effects of the Snow Storm on Railways.**

The York and Newcastle, the Scarborough, and the Whitby and Pickering Railways were on Sunday, Monday and Tuesday last stopped up with snow. It covered the rails in some parts to the height of six feet, being about level with the tops of the carriages. This of course put a damper on steam power, but only for a time, the snow being by contrivances, quickly cleared away, notwithstanding the immense masses in which it had collected, and the trains ran when every other mode of conveyance was effectually stopped. Lately, the demand in York for coals has been greater than the supply, and the railway has been the only means for its conveyance. Had the railway not been in existence, York and other places must have suffered severely from want of this indispensable material. We are told that the passengers of one of the trains from Whitby were sadly put about by being unexpectedly stuck fast in the snow. The train became fairly imbedded, and could neither proceed nor return. Some passengers determined upon taking up their abode in the carriages—others, more bold and less inclined to conform to circumstances, came to the resolution of exploring a better retreat, and having penetrated through the snow, fortunately arrived at a cottage, the proprietor of which happened to be a kind of providore to a few working people residing in the place. His snow-driven visitors were just about as many customers as he could accommodate with provisions, and his cottage was occupied to every inch the flooring could hold. The

snow storm came unexpectedly, and was unusually heavy, and therefore the inconvenience attending it will perhaps not be felt again. At all events it has been demonstrated that railways are better enabled to meet it than the old mode of conveyance. No accident of any importance, that is, no injury to life or limbs, we believe, has been sustained by this heavy fall of snow.

**A Railway Train without a Passenger.**

—A circumstance occurred at the North Union Railway station at Preston, on Sunday last, to which there is probably no parallel since the opening of the railway. The train which leaves the Preston station at half-past four o'clock in the afternoon took its departure without a single passenger. Considering that the traffic from Preston is generally so extensive, it is rather singular that such an event should have happened. The different officers present when the train left, declared their belief that a similar circumstance had never before happened at that station.—*Manchester paper.*

**New Safety Luggage Vans.**—The Eastern Union has just received from Lancashire a supply of luggage vans, constructed on a principle that combines safety to the train, with accommodation for the luggage. The van is rather longer than a second-class carriage, considerably higher, and so firmly tied by iron-work, as to be capable of resisting a very powerful shock. The fore-breast is made of iron, the sides are surrounded by iron stags, the buffers are so strong, and the screws so powerful and elastic, that one would think they could not be snapped in a collision. The interior of the van is divided into compartments, so as to carry luggage for different stations; and the guard has a room in the end next the train, where he can use a power-break, and, at the same time, see a considerable distance before the engine. It is said that similar vans are to be placed on the London and North Western line.—*Herald's Journal.*

**Improvement of the Severn.**—The River Severn, which is subject to alternate floods and droughts, has, during the last two years, been greatly improved by dredging, and by the erection of gigantic weirs and locks. These works are now completed from Bewdley to Worcester, a distance of seventeen miles, and from Worcester to Gloucester the river is being deepened by dredging and closer embankment, the Severn Act limiting the erection of weirs within the county of Worcester. By the operation of dredging, long rocky shoals have been entirely removed. The hardest rocks are first blasted under water, and, therefore, easily removed by the dredging machines. Upwards of 200,000 tons of marl, rock, gravel and soil, have already been raised from the bed of the Severn by Messrs. Grissel and Peto's dredging machine alone, besides what has been removed by another contractor. At Gloucester it has been necessary to remove the entire foundation of one of the piers of the old bridge, and in the course of this operation, some curious relics of ancient coins have been discovered.

**French Coal Mines.**—The Report of the Engineer appointed by the administration of roads and bridges in France, states, that the country is in the third rank as regards the production of coal; England and Belgium being the first and second. The production of England annually is 23,500,000; of Belgium, 4,500,000; of France, 3,783,000; and of the Zollverein, 3,000,000 tons. France contains 425 coal mines, on a surface of about 450,000 hectares; of these 173 are not worked. These mines employed in 1844 nearly 30,000 laborers. The amount of coal raised being insufficient for the consumption of the kingdom, about 1,500,000 tons are imported from England and Belgium. The number of steam engines of all sorts employed in France in 1844 was 4,310, of 65,950 horse power, about one-twelfth of the force employed in England. The quantity of iron consumed in the same year, was, in France, 480,000 tons; four times that used in Belgium, which was 120,000 tons; but only one-third of the English consumption, which was 1,200,000 tons; the amount consumed by the Zollverein in 1844 being 800,000 tons.

**Railways and Fresh Herrings.**—Herrings caught at Brighton in the morning, are sold in the Midland counties in the afternoon. This arises from the facilities of transit by the London and Brighton and London and North Western Railway, "and such has been the effect in the reduction of prices," says a Birmingham correspondent, "that the finest quality can now be had at the rate of from 20 to 25 for a shilling, being a reduction of nearly 200 per cent."

**VALUABLE PROPERTY ON THE MILL Dam For Sale.** A lot of land on Gravelly Point, so called, on the Mill Dam, in Roxbury, fronting on and east of Parker street, containing 68,497 square feet, with the following buildings thereon standing.

Main brick building, 120 feet long, by 46 ft wide, two stories high. A machine shop, 47x43 feet, with large engine, face, screw, and other lathes, suitable to do any kind of work.

Pattern shop, 35x32 ft. with lathes, work benches, Work shop, 86x35 feet, on the same floor with the pattern shop.

Forge shop, 118 feet long by 44 feet wide on the ground floor, with two large water wheels, each 16 feet long, 9 ft diameter, with all the gearing, shafts, drums, pulleys, &c., large and small trip hammers, turnaces, forges, rolling mill, with large balance wheel and a large blowing apparatus for the foundry.

Foundry, at end of main brick building, 60x45 feet two stories high, with a shed part 45x20 feet, containing a large air furnace, cupola, crane and corn oven.

Store house—a range of buildings for storage, etc., 200 feet long by 20 wide.

Locomotive shop, adjoining main building, fronting on Parker street, 54x25 feet.

Also—a lot of land on the canal, west side of Parker st., containing 6000 feet, with the following buildings thereon standing:

Boiler house 50 feet long by 30 feet wide, two stories.

Blacksmith shop, 49 feet long by 20 feet wide.

For terms, apply to HENRY ANDREWS, 48 State st., or to CURTIS, LEAVENS & CO., 106 State st., Boston, or to A. & G. RALSTON & Co., Philadelphia.

**RAILWAY IRON.—THE BEST QUALITY** of English Heavy H Rails—60 lbs. to the yard—now in store, landing from the vessel, and on ship board to arrive, for sale on most favorable terms by DAVIS, BROOKS & CO.,

Jan. 2. [14] 68 Broad St., New York.

## NORRIS' LOCOMOTIVE WORKS.

BUSH HILL, PHILADELPHIA, Pennsylvania.

**MANUFACTURE** their Patent 6 Wheel Combined and 8 Wheel Locomotives of the following descriptions, viz:

Class	1,	15 inches Diameter of Cylinder,	× 20 inches Stroke.
"	2,	14	" " × 24 " "
"	3,	14½	" " × 20 " "
"	4,	12½	" " × 20 " "
"	5,	11½	" " × 20 " "
"	6,	10½	" " × 18 " "

With Wheels of any dimensions, with their Patent Arrangement for Variable Expansion.

Castings of all kinds made to order: and they call attention to their Chilled Wheels, for the Trucks of Locomotives, Tenders and Cars.

NORRIS, BROTHERS.

### THE NEWCASTLE MANUFACTURING

Company continue to furnish at the Works, situated in the town of Newcastle, Del., Locomotive and other steam engines, Jack screws, Wrought iron work and Brass and Iron castings, of all kinds connected with Steamboats, Railroads, etc.; Mill Gearing of every description; Cast wheels (chilled) of any pattern and size, with Axles fitted, also with wrought tires, Springs, Boxes and bolts for Cars; Driving and other wheels for Locomotives.

The works being on an extensive scale, all orders will be executed with promptness and despatch. Communications addressed to Mr. William H. Dobbs, Superintendent, will meet with immediate attention.

ANDREW C. GRAY, President of the Newcastle Manuf. Co.

### RAILROAD IRON AND LOCOMOTIVE

Tyres imported to order and constantly on hand

A. & G. RALSTON  
Mar. 20th 4 South Front St., Philadelphia.

### KEARNEY FRIE BRICK. F. W.

BRINLEY, Manufacturer, Perth Amboy, N. J. Guaranteed equal to any, either domestic or foreign. Any shape or size made to order. Terms, 4 mos. from delivery of brick on board. Refer to

James P. Allaire, } New York.  
Peter Cooper, }

Gardiner, Harrison & Co. Newark, N. J.  
25,000 to 30,000 made weekly.

**TO LOCOMOTIVE AND MARINE ENGINE BOILER BUILDERS.** Pascal Iron Works, Philadelphia. Welded Wrought Iron Flues, suitable for Locomotives, Marine and other Steam Engine Boilers, from 2 to 5 inches in diameter. Also, Pipes for Gas, Steam and other purposes; extra strong Tube for Hydraulic Presses; Hollow Pistons for Pumps of Steam Engines, etc. Manufacture and for sale by

**MORRIS TASKER & MORRIS,**

Warehouse S. E. corner 3d and Walnut Sts., Philadelphia 11f

**PATENT INDESTRUCTIBLE WATER PIPES.** The subscribers continue to manufacture the above Pipes, of all the sizes and strength required for City or Country use, and would invite individuals or companies to examine its merits. This pipe, unlike cast iron and lead, imparts neither color, oxide or taste, being formed of strongly riveted sheet iron, and evenly lined on the inside with hydraulic cement. While in the process of laying, it has a thick covering externally of the same—thus forming nature's own conduit of stone. The iron being thoroughly enclosed on both sides with cement, precludes the possibility of rust or decay, and renders the pipe truly indestructible. The prices are less than those of iron or lead. We also manufacture Basins and D. Traps, for Water Closets, on a new principle, which we wish the public to examine at 112 Fulton street, New York.

**J. BALL & CO.**

**TO RAILROAD COMPANIES AND BUILDERS OF MARINE AND LOCOMOTIVE ENGINES AND BOILERS.**

**PASCAL IRON WORKS.**

**WELDED WROUGHT IRON TUBES**

From 4 inches to 4 in calibre and 2 to 12 feet long, capable of sustaining pressure from 400 to 2500 lbs. per square inch, with Stop Cocks, T. L., and other fixtures to suit, fitting together, with screw joints, suitable for STEAM, WATER, GAS, and for LOCOMOTIVE and other STEAM BOILER FLUES.

Manufactured and for sale by

**MORRIS, TASKER & MORRIS.**

Warehouse S. E. Corner of Third & Walnut Streets, PHILADELPHIA.

**BACK VOLUMES OF THE RAILROAD JOURNAL** for sale at the office, No. 105 Chestnut street.

**RAY'S EQUALIZING RAILWAY TRUCK.—THE SUBSCRIBER** having recently formed a business connection in the City of New

York, expressly for the manufacture of the newly patented and highly approved Railroad Truck of Mr. Fowler M. Ray, is ready to receive orders for building the same, from Railroad Companies and Car Builders in the United States, and elsewhere.

The above Truck has now been in use from one to two years on several roads a sufficient length of time to test its durability, and other good qualities, and to satisfy those who have used it, as may be seen by reference to the certificates which follow this notice.

There have been several improvements lately introduced upon the Truck, such as additional springs in the bolster of passenger cars, making them delightful riding cars—adapting it to tenders, trucks forward of the locomotive, and freight cars, which, with its original good qualities, make it in all respects the most desirable truck now offered to the public.

Orders for the above, will, for the present, be executed at the New York Screw Mill, corner 33d street and 3d avenue, (late P. Cooper's rolling mills) and at the Steam Engine Shop of T. F. Secor & Co., foot of 9th street, East

**LOCOMOTIVE AND CAR AXLES.**

The Subscribers are now prepared to receive orders for the well known and approved Reading Locomotive and Car Axles—drawn to any required pattern from Bloom Iron only. Address

**SAM'L KIMBER & CO.,**

Willow Street Wharf, Philadelphia, Pa.

41f

**NOTICE TO RAILROAD CONTRACTORS.**

Proposals will be received at the Office of the Boston and Maine Railroad, No. 60 State street, Boston, until Monday, the 8th day of February next, for the Graduation and Masonry on the line of Road in Andover, between the Merrimack River and a point of intersection with the old Road.

For examination of profile and work, application may be made at the office of the Engineers, at the Depot in South Andover.

**THOMAS WEST, President**

Boston and Maine Railroad.

January 22, 1847.

34

**NOTICE TO RAILROAD CONTRACTORS.**

Proposals will be received by the Subscriber, at the office of the Michigan Central Railroad Company, at Detroit, until the 16th day of February next, for Grading the first thirteen miles of the Extension of the Michigan Central Railroad, from Kalamazoo, westward; said thirteen miles contains about four hundred thousand cubic yards of earth work. Plans and Specifications will be ready for examination at the office of the subscriber after February 1st.

**J. W. BROOKS, Supt. & Eng.**

Detroit, January 5, 1847.

53

**A. & G. RALSTON & CO., NO. 4**

South Front St., Philadelphia, Pa. Have now on hand, for sale, Railroad Iron, viz:

180 tons 2 1/2 x 1/4 inch Flat Punched Rails, 20 ft. long.

25 " 2 1/2 x 1/4 " Flange Iron Rails.

75 " 1 x 1/4 " Flat Punched Bars for Drafts in Mines. A full assortment of Railroad Spikes, Boat and Ship Spikes. They are prepared to execute orders for every description of Railroad Iron and Fixtures.

11

**RAILROAD IRON.—THE NEW JERSEY**

Iron Company, Boonton, N. J., are now preparing to make Railroad Bars, and are ready to take orders or make contracts for Rails, deliverable after the first of December next. Apply to

**FULLER & BROWN, Agent,**

No. 139 Greenwich, corner of Cedar street.

September 18, 1846.

10:39

**NICOLL'S PATENT SAFETY SWITCH**

for Railroad Turnouts. This invention, for some time in successful operation on one of the principal railroads in the country, effectually prevents engines and their trains from running off the track at a switch, left wrong by accident or design.

It acts independently of the main track rails, being laid down, or removed, without cutting or displacing them.

It is never touched by passing trains, except when in use, preventing their running off the track. It is simple in its construction and operation, requiring only two Castings and two Rails; the latter, even if much worn or used, not objectionable.

Working Models of the Safety Switch may be seen at Messrs. Davenport and Bridges, Cambridgeport, Mass., and at the office of the Railroad Journal, New York.

Plans, Specifications, and all information obtained on application to the Subscriber, Inventor, and Patentee

**G. A. NICOLLS,**

Reading, Pa.

**RAILROAD IRON.—THE SUBSCRIBER'S**

New Rail Iron Mill at Phoenixville, Pa., is expected to be ready to go into operation by the 1st of September, and will be capable of turning out 30 to 40 tons or finished Rails per day. They are now prepared to receive orders to that extent, deliverable after the 1st of October next, for heavy rails of any pattern now in use, equal in quality and finish to best imported.

**PIG IRON.**—They are also receiving weekly 150 to 200 tons of No. 1 Phoenix Foundry Iron, well adapted for light castings.

**REEVES, BUCK & CO,**

45 North Water St., Philadelphia,

or by their Agent, **ROBT. NICHOLS,**

79 Water St., New York

**THE SUBSCRIBERS, AGENTS FOR**

the sale of

Codorus,  
Glendon,  
Spring Mill and  
Valley, } Pig Iron.

Have now a supply, and respectfully solicit the patronage of persons engaged in the making of Machinery, for which purpose the above makes of Pig Iron are particularly adapted.

They are also sole Agents for Watson's celebrated Fire Bricks and prepared Kaolin or Fire Clay orders for which are promptly supplied.

**SAM'L KIMBER, & CO.,**

59 North Wharves,

Jan. 14, 1846. [1y4] Philadelphia, Pa.

river, (of which firm the subscriber was late a partner) under the immediate supervision of Mr. Ray himself.

Several sets of trucks containing the latest improvements have recently been turned out for the New York and Erie railroad, and the New Jersey Transportation company, which may be seen upon said roads.

The patronage of Railroad Companies and Car Builders is respectfully solicited.

New York, May 4, 1846.

**W. H. CALKINS, and Others.**

To all whom it may concern:—This is to certify that the New Haven, Hartford and Springfield railroad co., have had in use six sets of F. M. Ray's patent trucks for the last 20 months, during which time it appears to me, they have proved to be the best and most economical truck now in use.

[Signed.]

**WILLIAM ROE, Supt of Power.**

I certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Philadelphia and Reading railroad for some time past, under a passenger car.

For simplicity of construction, economy in cost, lightness of material, and extreme ease of motion, I consider it the best truck we have ever used. Its peculiar make also renders it less liable to be thrown off the track, when passing over any obstruction. We intend using it extensively under the passenger and freight cars of the above road.

Reading, Pa., October 6, 1845.

[Signed.] **G. A. NICOLL,**

Supt. Transportation, etc., Philadelphia and Reading Railroad.

To all whom it may concern:—This is to certify that the N. Jersey Railroad and Transportation company have used Fowler M. Ray's Truck for the last seven months, during which time it has operated to our entire satisfaction. I have no hesitation in saying that it is the simplest and most economical truck now in use.

[Signed.] **T. L. SMITH,**

Jersey City, November 4, 1845. N. Jersey Railroad and Transp. Co.

This is to certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Long Island railroad for the last year, under a freight car.

For simplicity of construction, economy in cost, lightness of material and ease of motion, I consider it equal to any truck we have in use.

Long Island Railroad Depot, } [Signed.] **JOHN LEACH,**

Jamaica November 12, 1845. } 1y19

Supt Motive Power.

**RICH & CO'S IMPROVED PATENT SALAMANDER SAFES.**

Warranted free from dampness, as well as fire and thief proof.

Particular attention is invited to the following certificates, which speak for themselves:

**TEST No. 10.**

*Certificate from Mr. Silas C. Field, of Vicksburgh, Mississippi.*

On the morning of the 14th ult., the store owned and occupied by me in this city, was, with its contents, entirely consumed by fire. My stock of goods consisted of oil, rosin, lard, pork, sugar, molasses, liquors, and other articles of a combustible nature, in the midst of which was one of Rich's Improved Patent Salamander Safes, which I purchased last October of Mr. Isaac Bridge, New Orleans, and which contained my books and papers. This safe was red hot, and did not cool sufficiently to be opened until 16 hours after it was taken from the ruins. At the expiration of that time it was unlocked, when its contents proved to be entirely uninjured, and not even discolored. I deem this test sufficient to show that the high reputation enjoyed by Rich's Safes is well merited.

S. C. FIELD.

**TEST No. 11.—Certificate.**

By the fire which occurred in this village on the 27th July last, our Law Office, together with many other buildings, was destroyed—we had in our office one of Rich's Improved Patent Salamander Safes, which, though heated red hot, preserved, without being the least damaged, many papers valuable to our clients—the envelopes of a few papers being slightly scorched. Some twenty-four hours after the fire, the Safe was removed, and so hot was it, that several hours were required for it to cool off. Our office was in the second story of a large brick building, all the wood used in construction of said house being pitch pine. While the Safe was red hot, one of the walls tumbled in, and so injured the lock that it was necessary to break the door open. From this test, we feel no hesitation in recommending "Rich's Patent Salamander Safe" as *entirely fire proof.*

GORE & KING.

Marion, Ala., Sept. 15th, 1846.

*Still other Tests in the Great Fire of July 19, 1845.*

The undersigned purchased of A. S. Martin, No. 134½ Water street, one of Rich's Improved Patent Salamander Safes, which was in our store, No. 54 Exchange place. The store was entirely consumed in the great conflagration on the morning of the 19th inst. The safe was taken from the ruins 52 hours after, and on opening it, the books and papers were found entirely uninjured by fire, and only slightly wet—the leather on some of the books was parched by the extreme heat, RICHARDS & CRONKHITE.

Benton, Miss., December 27, 1845.

One of Rich's Improved Salamander Safes, which I purchased on the 2d of June last of A. S. Marvin, 138½ Water street, agent for the manufacturer, was exposed to the most intense heat during the late dreadful conflagration. The store which I occupied, No. 46 Broad street, was entirely consumed; the safe fell from the 2d story, about 15 feet, into the cellar, and remained there 14 hours, and when found, I am told, and from its appearance afterwards, should judge that it had been heated to a red heat. On opening it, the books and papers were found not to have been touched by fire. I deem this ordeal sufficient to confirm fully the reputation that Rich's safe has already obtained for preserving its contents against all hazards. (Signed)

WM. BLOODGOOD.

New York, 21st July, 1845.

Reference made to upwards of nine hundred and fifty merchants, cashiers, brokers, and officers of courts and counties, who have Rich's Safe's in use.

The above safes are finished in the neatest manner, and can be made to order at short notice, of any size and pattern, and fitted to contain plate, jewelry, etc. Prices from \$50 to \$500 each. For sale by

A. S. MARVIN, General Agent,  
138½ Water st., N. Y.

Also by Isaac Bridge 76 Magazine street, New Orleans.

Also by Lewis M Hatch, 190 Meeting street, Charleston, S. C.

**FRENCH AND BAIRD'S PATENT SPARK ARRESTER.**

TO THOSE INTERESTED IN Railroads, Railroad Directors and Managers are respectfully invited to examine an improved SPARK ARRESTER, recently patented by the undersigned.

Our improved Spark Arresters have been extensively used during the last year on both passenger and freight engines, and have been brought to such a state of perfection that no annoyance from sparks or dust from the chimney of engines on which they are used is experienced.

These Arresters are constructed on an entirely different principle from any heretofore offered to the public. The form is such that a rotary motion is imparted to the heated air, smoke and sparks passing through the chimney, and by the centrifugal force thus acquired by the sparks and dust they are separated from the smoke and steam, and thrown into an outer chamber of the chimney through openings near its top, from whence they fall by their own gravity to the bottom of this chamber; the smoke and steam passing off at the top of the chimney, through a capacious and unobstructed passage, thus arresting the sparks without impairing the power of the engine by diminishing the draught or activity of the fire in the furnace.

These chimneys and arresters are simple, durable and neat in appearance. They are now in use on the following roads, to the managers and other officers of which we are at liberty to refer those who may desire to purchase or obtain further information in regard to their merits:

R. L. Stevens, President Camden and Amboy Railroad Company; Richard Peters, Superintendent Georgia Railroad, Augusta, Ga.; G. A. Nicolls, Superintendent Philadelphia, Reading and Pottsville Railroad, Reading, Pa.; W. E. Morris, President Philadelphia, Germantown and Norristown Railroad Company, Philadelphia; E. B. Dudley, President W. and R. Railroad Company, Wilmington, N. C.; Col. James Gadsden, President S. C. and C. Railroad Company, Charleston, S. C.; W. C. Walker, Agent Vicksburgh and Jackson Railroad, Vicksburgh, Miss.; R. S. Van Rensselaer, Engineer and Sup't Hartford and New Haven Railroad; W. R. M'Kee, Sup't Lexington and Ohio Railroad, Lexington, Ky.; T. L. Smith, Sup't New Jersey Railroad Trans. Co.; J. Elliott, Sup't Motive Power Philadelphia and Wilmington Railroad, Wilmington, Del.; J. O. Sterns, Sup't Elizabethtown and Somerville Railroad; R. R. Cuyler, President Central Railroad Company, Savannah, Ga.; J. D. Gray, Sup't Macon Railroad, Macon, Ga.; J. H. Cleveland, Sup't Southern Railroad, Monroe, Mich.; M. F. Chittenden, Sup't M. P. Central Railroad, Detroit, Mich.; G. B. Fisk, President Long Island Railroad, Brooklyn.

Orders for these Chimneys and Arresters, addressed to the subscribers, care Messrs. Baldwin & Whitney, of this city or to Hinckly & Drury, Boston, will be promptly executed. FRENCH & BAIRD.

N. B.—The subscribers will dispose of single rights, or rights for one or more States, on reasonable terms.

Philadelphia, Pa., April 6, 1844.

•• The letters in the figures refer to the article given in the Journal of June, 1844.

ja45

**PATENT HAMMERED RAILROAD, SHIP and Boat Spikes.** The Albany Iron and Nail Works have always on hand, of their own manufacture, a large assortment of Railroad, Ship and Boat Spikes, from 2 to 12 inches in length, and of any form of head. From the excellence of the material always used in their manufacture, and their very general use for railroads and other purposes in this country, the manufacturers have no hesitation in warranting them fully equal to the best spikes in market, both as to quality and appearance. All orders addressed to the subscriber at the works, will be promptly executed. JOHN F. WINSLOW, Agent.

Albany Iron and Nail Works, Troy, N. Y. The above spikes may be had at factory prices, of Erastus Corning & Co., Albany; Hart & Merriut, New York; J. H. Whitney, do.; E. J. Eting, Philadelphia; Wm. E. Coffin & Co., Boston. ja45

**MACHINE WORKS OF ROGERS,** Ketchum & Grosvenor, Patterson, N. J. The undersigned receive orders for the following articles, manufactured by them of the most superior description in every particular. Their works being extensive and the number of hands employed being large, they are enabled to execute both large and small orders with promptness and despatch.

Railroad Work. Locomotive steam engines and tenders; Driving and other locomotive wheels, axles, springs & flange tires; car wheels of cast iron, from a variety of patterns, and chills; car wheels of cast iron with wrought tires; axles of best American refined iron; springs; boxes and bolts for cars.

Cotton, Wool and Flax Machinery of all descriptions and of the most improved patterns, style and workmanship.

Mill gearing and Millwright work generally; hydraulic and other presses; press screws; callenders; lathes and tools of all kinds; iron and brass castings of all descriptions.

ROGERS, KETCHUM & GROSVENOR, 445 Paterson, N. J., or 60 Wall street, N. York.

**PATENT RAILROAD, SHIP AND BOAT Spikes.** The Troy Iron and Nail Factory keeps constantly for sale a very extensive assortment of Wrought Spikes and Nails, from 3 to 10 inches, manufactured by the subscriber's Patent Machinery, which after five years' successful operation, and now almost universal use in the United States (as well as England, where the subscriber obtained a patent) are found superior to any ever offered in market.

Railroad companies may be supplied with Spikes having countersink heads suitable to holes in iron rails, to any amount and on short notice. Almost all the railroads now in progress in the United States are fastened with Spikes made at the above named factory—for which purpose they are found invaluable, as their adhesion is more than double any common spikes made by the hammer.

All orders directed to the Agent, Troy, N. York will be punctually attended to.

HENRY BURDEN, Agent.

Spikes are kept for sale, at Factory Prices, by I. & J. Townsend, Albany, and the principal Iron merchants in Albany and Troy; J. I. Brower, 222 Water St., New York; A. M. Jones, Philadelphia; T. Janviers, Baltimore; Degrand & Smith, Boston.

•• Railroad Companies would do well to forward their orders as early as practicable, as the subscriber is desirous of extending the manufacturing so as to keep pace with the daily increasing demand. ja45

**DAVENPORT & BRIDGES CONTINUE** to Manufacture to Order, at their Works, in Cambridgeport, Mass., Passenger and Freight Cars of every description, and of the most improved pattern. They also furnish Snow Ploughs and Chilled Wheels of any pattern and size. Forged Axles, Springs, Boxes and Bolts for Cars at the lowest prices. All orders punctually executed and forwarded to any part of the country.

Our Works are within fifteen minutes ride from State street, Boston—coaches pass every fifteen minutes.

## THE HERRON RAILWAY TRACK,

As seen stripped of the top ballasting

A GOLD MEDAL AWARDED THE INVENTOR BY THE AMERICAN INSTITUTE.

**THE UNDERSIGNED RESPECTFULLY** invites the attention of Engineers, and Railroad Companies, to some highly important improvements he has recently made in the Herron system of the trellis for the purpose of giving an additional, Railway structure. These improvements enable him to effect a very large reduction in the quantity of Timber, and cost of construction, without impairing the strength of the Track, or its powers of resisting frost, while they secure additional features of excellence in the Drainage and facility of making Repairs.

The above cut represents the "Herron Track" as it is laid on the Philadelphia and Reading, and on the Baltimore and Susquehanna Railroads. The intersection of the sills of the trellis are 5 feet from centre to centre, while in the new construction they are only 2½ feet. This renders the string piece unnecessary, thus removing the only objectionable feature found in the Track.

The result of experience has proved that all Tracks constructed with longitudinal timbers, such as mud sills, and more especially, the continuous bearing string pieces retain the rain water that falls between the Rails, which, being thus confined, settles along those timbers, and accumulating in quantity flows rapidly along them on the descending grades, washing out the earth from under the timber, and frequently causing large breaches in the embankments of the road. Whereas all water intercepted by the oblique sills of the trellis, is discharged immediately into the side ditches.

In the 5 foot plan, the Track occupies a Road bed nearly 11 feet wide, while the new construction takes

but 8 feet, the timber being more concentrated under the Rails. A block of hard wood, about 2 feet long and 15 inches wide, is introduced into a square of the trellis for the purpose of giving an additional, and effectual support to the joints of the Rails, which rest upon it. Should these joint blocks become chafed and worn by the working, and imbedding of the chairs, as is now the case on all Railroads, they can be readily replaced without any derangement of the timbers less liable to wear.

The following is a general estimate of its cost near the seaboard. In the interior it will be considerably less.

ESTIMATE OF THE PROBABLE COST OF ONE MILE.		
1,224 Timbers, 11 ft. long, 3 x 6 inches =	68,696 ft. b.m., at \$10 =	\$686 96
587 Oak joint blocks 2 ft. x 3 x 15 in. =	4,403 ft. b.m., at \$13 =	57 21
13,000 Spikes = 2,250 lbs. at 4½ cts =		101 25
Workmanship free of patent charge		600 00

Cost of one mile including the laying of the Rail.....\$1,445 45

He has made other important improvements, which will be shown in properly proportioned models, that give a much better idea of the great strength of the Track than a drawing will do.

Sales of the Patent right to all the distant States will be made on liberal terms.

JAMES HERRON.

Civil Engineer and Patentee.

No. 277 South Tenth St., Philadelphia. 33tf

**ENGLISH PATENT WIRE ROPES—FOR THE USE OF MINES, RAILWAYS, ETC.—** for sale or imported to order by the subscriber.

These Ropes are manufactured on an entirely different principle from any other, and are now almost exclusively used in the collieries and on the railways in Great Britain, where they are considered to be greatly superior to hempen ones, or iron chains, as regards safety, durability and economy. The plan upon which they are made effectually secures them from corrosion in the interior, as well as the exterior of the rope, and gives a greater compactness and elasticity than is found in any other manufacture.

Many of these ropes have been in constant operation in the different mines in England, and on the Blackwall and other inclined planes, for three and four years, and are still in good condition.

They have been applied to almost every purpose for which hempen ropes have been used—mines, heavy cranes, standing rigging, window cords, lightning conductors, signal halyards, tiller ropes, etc. Reference is made to the annexed statement for the relative strength and size. Testimonials from the most eminent engineers in England can be shown as to their efficiency, and any additional information required respecting the different descriptions and application will be given by

ALFRED L. KEMP,

75 Broad street, New York, sole agent in the United States.

Statement of Trial made at the Woolwich Royal Dock Yard, of the Patent Wire Ropes, as compared with Hempen Ropes and Iron Chains of the same strength.—October, 1841.

WIRE ROPES.			HEMPEN ROPES.			CHAINS.		STRENGTH Tons.
Wire gauge number.	Circumference of rope.	Weight per fathom.	Circumference of rope.	Weight per fathom.		Weight per fathom.	Diameter of iron.	
	INCH.	LEBS. OZ.	INCH.	LEBS. OZ.		LEBS.	INCH.	
11	4½	13 5	10	24 -		50	15-16	20
13	3½	8 3	8½	16 -		27	11-16	13½
14	3½	6 11	7½	12 8		17	9-16	10½
15	2½	5 2	6½	9 4		13½	1-2	7½
16	2½	4 3	6	8 8		10½	7-16	7

N.B. The working load, with a perpendicular lift, may be taken at 6 cwt. for every lb. weight per fathom, so that a rope weighing 5 lbs. per fathom would safely lift 3360 lbs., and so on in proportion. 1y21

**BOSTON AND PROVIDENCE RAILROAD.** Passenger Notice. Summer Arrangement. On and after Monday, Sept. 28, 1846, the Passenger Trains will run as follows:

For New York—Night Line, via Stonington. Leaves Boston every day, but Sunday, at 5 p.m. Accommodation Trains, leave Boston at 7½ a.m. and 3½ p.m., and Providence at 8 a.m. and 3½ p.m. Dedham trains, leave Boston at 9 a.m.; 3 p.m., 5½ p.m., and 10½ p.m. Leave Dedham at 8 a.m. and 4½ and 9 p.m.

Stoughton trains, leave Boston at 11½ a.m. and 4-10 p.m. Leave Stoughton at 8 a.m. and 2½ p.m. All baggage at the risk of the owners thereof.  
31 ly W. RAYMOND LEE, Sup't.

**BRANCH RAILROAD and STAGES** Connecting with the Boston and Providence Railroad. Stages connect with the Accommodation trains at the Foxboro' Station, to and from Woonsocket. At the Seekonk Station, to and from Lonsdale, R. I. via Pawtucket. At the Sharon Station, to and from Walpole, Mass. And at Dedham Village Station, to and from Medford, via Medway, Mass. At Providence, to and from Bristol, via Warren, R. I.—Taunton, New Bedford and Fall River cars run in connection with the accommodation trains.

## BOSTON AND MAINE RAILROAD.

Upper Route, Boston to Portland via, Reading, Andover, Haverhill, Exeter, Dover, Great Falls, South & North Berwick, Wells, Kennebunk and Saco.

Winter Arrangement, 1846-7.

On and after October 5th, 1846, Passenger Trains will leave daily, (Sundays excepted,) as follows: Boston for Portland at 7½ a.m. and 2½ p.m.

Boston for Great Falls at 7½ a.m., 2½ and 3-25 p.m.

Boston for Haverhill at 7½ and 11½ a.m., 2½, 3-25 and 5 p.m.

Boston for Reading at 7½ and 11½ a.m., 2½, 3-25 and 6½ p.m.

Portland for Boston at 7½ a.m., and 3 p.m.

Great Falls for Boston at 6½ and 9½ a.m., and 4½ p.m.

Haverhill for Boston at 7½, 8½, and 11 a.m. and 3 and 6½ p.m.

Reading for Boston at 7, 8½ and 9½ a.m., 12 m., 1½, 4 and 7½ p.m.

The Depot in Boston is on Haymarket Square.

Passengers are not allowed to carry Baggage above \$50 in value, and that personal Baggage, unless notice is given, and an extra amount paid, at the rate of the price of a Ticket for every \$500 additional value.

CHAS. MINOT, Super't.

## THE BEST RAILROAD ROUTE TO THE

Lake and Buffalo, from Cincinnati.

Take Cars to Xenia, 65

miles; take Stage to Mansfield, 88 miles; thence by Cars to Sandusky, 56 miles to the Lake; thence Steamboat to Buffalo, 230 miles.

Fare from Cincinnati to Sandusky.....\$8 00

" " Sandusky to Buffalo, Cabin..... 6 00

" " " " Steerage.... 4 50

Fare by this route, although the cheapest across the state, will be reduced in a short time, railroad lengthened, and speed increased.

Leave Cincinnati in the morning, arrive at Columbus at night.

Leave Columbus in the morning, arrive at Sandusky same day.

Leave Sandusky, by Boat, in the morning, arrive at Buffalo next morning in time for the Cars north and east for Niagara Falls, Canada, Saratoga Springs, Troy, Albany, Boston, New York, Washington, or Philadelphia.

Passengers should not omit to pay their fare through from Cincinnati to Sandusky, or from Columbus to Sandusky via Mansfield; as this route is the only one that secures 56 miles (this road is run over in 2h. 50m.,) most railroad which is new, and is the shortest, cheapest and most expeditious across the state.

Fares on the New York railroads are about to be reduced.

Sandusky, Ohio.

B. HIGGINS, Sup't, etc.

M. & S. C. R. R. Co.

## SUMMER ARRANGEMENT.—NEW YORK

AND ERIE RAILROAD LINE, from April 1st until further notice, will

run daily (Sundays excepted) between the city of New York and Middletown, Goshen, and intermediate places, as follows:

FOR PASSENGERS—

Leave New York at 7 A. M. and 4 P. M.

" Middletown at 6½ A. M. and 5½ P. M.

FARE REDUCED TO \$1 25 to Middletown—way in proportion. Breakfast, supper and berths can be had on the steamboat.

FOR FREIGHT—

Leave New York at 5 P. M.

" Middletown at 12 M.

The names of the consignee and of the station where to be left, must be distinctly marked upon each article shipped. Freight not received after 5 P. M. in New York.

Apply to J. F. Clarkson, agent, at office corner of Duane and West sts. H. C. SEYMOUR, Sup't, March 25th, 1846.

Stages run daily from Middletown, on the arrival of the afternoon train, to Milford, Carbondale, Honesdale, Montrose, Towanda, Owego, and West; also to Monticello, Windsor, Binghamton, Ithaca, etc., etc. Agent on board. 13 u

## NORWICH AND WORCESTER RAIL-

Road. Summer Arrangement, commencing Monday, April 6, 1846.

Accommodation Trains, daily,

except Sunday. Leave Norwich, at 6 a.m., and 4½ p.m. Leave Worcester, at 10 a.m., and 4½ p.m.

The morning Accommodation Trains from Norwich, and from Worcester, connect with the trains of the Boston, and Worcester and Western railroads each way.

The Evening Accommodation Train from Worcester connects with the 1½ p.m. train from Boston.

New York Train via Long Island Railroad:

Leave Allyn's Point for Boston, about 1 p.m., daily, except Sunday.

Leave Worcester for New York, about 10 a.m., stopping at Webster, Danielsonville, and Norwich.

New York Train via Steamboat—Leave Norwich for Boston, every morning, except Monday, on the arrival of the stambot from New York, stopping at Norwich and Danielsonville.

Leave Worcester for New York, upon the arrival of the train from Boston, at about 4½ p.m., daily, except Sunday, stopping at Webster, Danielsonville and Norwich.

Freight Trains daily each way, except Sunday.—Special contracts will be made for cargoes, or large quantities of freight, on application to the superintendent.

Fares are Less when paid for Tickets than when paid in the Cars. 321y J. W. STOWELL, Sup't.

# TROY RAILROADS.—IMPORTANT NOTICE.—Troy and Greenbush Railroad, forming a continuous track from Boston to Buffalo and Saratoga Springs.

This road is new, and laid with the heaviest iron H rail. Trains will always be run on this road connecting at Greenbush each way with the trains to and from Boston and intermediate places, leaving Greenbush daily at 1 1/2 p.m. and 6 p.m., or on arrival of the trains from Boston; leave Troy at 7 1/2 a.m. and 4 1/2 p.m., or to connect with trains to Boston. Trains also run hourly on this road between Troy and Albany. Running time between Greenbush and Troy, 15 minutes.

## TROY AND SCHENECTADY RAILROAD.

This road is laid its entire length with the heaviest H rail—which is not the fact with the road from Albany. Trains will always be run on this road connecting each way, to and from Buffalo and intermediate places. Leave Troy for Buffalo at 7 1/2 a.m. and 1 p.m. and 6 1/2 p.m., or to connect with the trains for the west; leave Schenectady at 2 1/2 a.m., 8 1/2 a.m., 1 p.m. and 3 1/2 p.m., or on arrival of the trains from Buffalo and intermediate places.

## TROY AND SARATOGA RAILROAD.

THE ONLY DIRECT ROUTE.

No change of passenger, baggage or other cars on this route. Cars leave Troy for Ballston, Saratoga Springs, Lake George and White Hall at 7 1/2 a.m., (arriving one hour in advance of the train from Albany,) and at 3 1/2 p.m. Returning, leave Saratoga at 9 a.m. and 3 1/2 p.m., (reaching Troy in time for the evening boats to New York.) Cars also leave Troy for the Burrough at 3 1/2 p.m. and 7 p.m., connecting with packet boats for the north. This takes passengers from New York and Boston to Montreal in 44 hours.

N.B. Travellers will find the routes through Troy most convenient and economical, and as expeditious as any other. The steamboats to and from New York land within a few steps of the railroad office, and passengers are taken up and landed by the different railroad lines at the doors of principal hotels, thus saving all necessity for, and annoyance from, hack drivers, cabmen, runners, etc.

Aug 3, 1846.

1y 32

# BALTIMORE AND OHIO RAILROAD.

**MAIN STEM:** The Train carrying the Great Western Mail leaves Baltimore every morning at 7 1/2 and Cumberland at 8 o'clock, passing Ellicott's Mills, Frederick, Harpers Ferry, Martinsburgh and Hancock, connecting daily each way with the Washington Trains at the Relay House seven miles from Baltimore, with the Winchester Trains at Harpers Ferry—with the various railroad and steamboat lines between Baltimore and Philadelphia and with the lines of Post Coaches between Cumberland and Wheeling and the fine Steamboats on the Monongahela Slack Water between Brownsville and Pittsburgh. Time of arrival at both Cumberland and Baltimore 5 1/2 P. M. Fare between those points \$7, and 4 cents per mile for less distances. Fare through to Wheeling \$11 and time about 36 hours, to Pittsburgh \$10, and time about 32 hours. Through tickets from Philadelphia to Wheeling \$13, to Pittsburgh \$12. Extra train daily except Sundays from Baltimore to Frederick at 4 P. M., and from Frederick to Baltimore at 8 A. M.

## WASHINGTON BRANCH.

Daily trains at 9 A. M. and 5 P. M. and 12 at night from Baltimore and at 6 A. M. and 5 1/2 P. M. from Washington, connecting daily with the lines North, South and West, at Baltimore, Washington and the Relay house. Fare \$1 60 through between Baltimore and Washington, in either direction, 4 cents per mile for intermediate distances. 1y31

**THE SUBSCRIBER IS PREPARED TO** execute at the Trenton Iron Works, orders for Railroad Iron of any required pattern, and warranted equal in every respect in point of quality to the best American or imported Rails. Also on hand and made to order, Bar Iron, Braziers' and Wire Rods, etc., etc.

PETER COOPER 17 Burling Slip.

New York.

# NEW RAILROAD ROUTE FROM BUFFALO TO CINCINNATI.

Passengers destined for Columbus and Cincinnati, O., Louisville, Ky., St. Louis, Mo., Memphis, Tenn., Vicksburg, Natches, New Orleans, and all intermediate ports, will find a new, and the most expeditious and comfortable Route, by taking Steamboats at Buffalo, landing at Sandusky City, Ohio, distance..... 230 miles.

From thence by Cars, over the Mansfield Railroad which is new and just opened [laid with heavy iron,] to Mansfield, distance..... 56 " Thence by Stage via Columbus to Xenia over gravel and Macadamized Road, (the best in the state,) in new coaches, distance..... 88 " Thence, over the Little Miami Railroad, from Xenia to Cincinnati, distance..... 65 "

## TIME.

From Buffalo to Sandusky..... 24 hours. Leave Sandusky 5 a.m. to Columbus..... 14 " From Columbus to Cincinnati..... 13 " Or say 30 hours from Sandusky to Cincinnati over this route, including delays.

## FARE.

From Buffalo to Sandusky, Cabin.....\$6 00 " " " Steerage..... 3 00 " Sandusky to Columbus..... 4 50 " " through to Cincinnati..... 8 00

Passengers should not omit to pay their fare through from Sandusky City to Cincinnati and take receipts availing themselves of the benefit of a contract existing between the said Railroad and Stage Co's, securing 121 miles travel by good Railroad and 88 miles by Stage, in crossing from Lake Erie to the Ohio river, in the space of 30 hours.

Passengers destined for St. Louis, or any point below on the Mississippi, will save by taking this route, from 4 to 6 days time and travel, and nearly half the expense, over the Chicago and Peoria route to the above places.

Fare by this route, although the cheapest, will in a short time be reduced, Railroad lengthened, and speed increased.

B. HIGGINSON, Sup't, etc.

M. & S. C. R. R. Co.

Sandusky City, Ohio.

# NEW YORK & HARLEM RAILROAD CO.—Winter Arrangement.

On and after Monday, November 23, 1846, the cars will run as follows:

Leave 27th street for 42d street, Deaf and Dumb Institute, Yorkville, Harlem Morrianna, and Williams' Bridge, at 7 o'clock a.m. From City Hall for above named places, 2 p.m. [freight train,] 2 30 p.m. 5 p.m. to Morrisania only.

Leave City Hall for Harlem, Morrisania, Fordham and Williams' Bridge, at 7 45 a.m., and 10 45 a.m.; 1 15 p.m., 2 p.m. [freight train,] 2 30 p.m. and 3 45 p.m.

Leave City Hall for Hunt's Bridge, Bronx, Tuckahoe, Hart's Corners White Plains, Davis' Brook, Unionville and Pleasantville, [Pleasantville 4 miles from Sing Sing,] 7 45 and 10 45 a.m.; 1 15 p.m., 2 p.m. [freight train,] and 3 45 p.m.

## RETURNING.

Leave Pleasantville, at 8, 10, [freight train,] and 11 a.m.; 1 20, and 4 p.m.

Leave White Plains, at 8 12, 10 30, [freight train] and 11 20 a.m.; 1 50, and 4 20 p.m.

Leave Tuckahoe, 8 35, 10 55, [freight train,] and 11 35 a.m.; 2 05, and 4 35 p.m.

Leave Williams' Bridge at 7 45, 8 50 and 11 50 a.m.; 2 10, 4, and 4 50 p.m.

Leave Morrisania 8 and 9 05 a.m.; 12 05, 2 35, 4 20, 5 05 and 6 p.m.

Leave Yorkville, at 8 12 a.m.; 4 35 and 6 15 p.m.

## SUNDAY ARRANGEMENTS.

Leave City Hall for Pleasantville and intermediate places, at 7 45 a.m.; 1 15 and 3 p.m.

Leave Pleasantville for City Hall, at 8 a.m.; 11, and 3 15 p.m.

Leave City Hall for Williams' Bridge and intermediate places, 10 45 a.m.; 2 30 p.m.

Leave Williams' Bridge for City Hall, at 8 50 and 11 50 a.m.; 1, 3 45 and 4 05 p.m. 1y49

# BALTIMORE AND SUSQUEHANNA RAILROAD.—Reduction of Fare. Morning and Afternoon Trains between Baltimore and York.—The Passenger

trains run daily, except Sunday, as follows: Leaves Baltimore at..... 9 a.m. and 3 1/2 p.m. Arrives at..... 9 a.m. and 6 1/2 p.m. Leaves York at..... 5 a.m. and 3 p.m. Arrives at..... 12 1/2 p.m. and 8 p.m. Leaves York for Columbia at..... 1 1/2 p.m. and 8 a.m. Leaves Columbia for York at..... 8 a.m. and 2 p.m.

## FARE.

Fare to York.....\$1 50 " Wrightsville..... 2 00 " Columbia..... 2 12 1/2

Way points in proportion.

## PITTSBURG, GETTYSBURG AND HARRISBURG.

Through tickets to Pittsburg via stage to Harrisburg..... \$9 Or via Lancaster by railroad..... 10 Through tickets to Harrisburg or Gettysburg... 3 In connection with the afternoon train at 3 1/2 o'clock, a horse car is run to Green Spring and Owings' Mill, arriving at the Mills at..... 5 1/2 p.m. Returning, leaves Owings' Mills at..... 7 a.m.

D. C. H. BORDLEY, Sup't.

# SOUTH CAROLINA RAILROAD.—A

Passenger Train runs daily from Charleston,

on the arrival of the boats from Wilmington, N. C., in connection with trains on the Georgia, and Western and Atlantic Railroads—and by stage lines and steamers connects with the Montgomery and West Point, and the Tusculumbia Railroad in N. Alabama. Fare through from Charleston to Montgomery daily..... \$26 50

Fare through from Charleston to Huntsville, Decatur and Tusculumbia..... 22 00

The South Carolina Railroad Co. engage to receive merchandise consigned to their order, and to forward the same to any point on their road; and to the different stations on the Georgia and Western and Atlantic railroad; and to Montgomery, Ala., by the West Point and Montgomery Railroad.

1y25 JOHN KING, Jr, Agent.

# CENTRAL RAILROAD—FROM SAVANNAH TO MACON. Distance 190 miles.

This Road is open for the transportation of Passengers and Freight.

Rates of Passage, \$8 00. Freight—

On weight goods generally... 50 cts. per hundred.

On measurement goods..... 13 cts. per cubic ft.

On brls. wet (except molasses and oil).....\$1 50 per barrel.

On brls. dry (except lime)... 80 cts. per barrel.

On iron in pigs or bars, castings for mills, and unboxed machinery..... 40 cts. per hundred.

On hhd. and pipes of liquor, not over 120 gallons.....\$5 00 per hhd.

On molasses and oil.....\$6 00 per hhd.

Goods addressed to F. WINTER, Agent, forwarded free of commission.

THOMAS PURSE, y40 Gen'l. Sup't. Transportation.

# MANUFACTURE OF PATENT WIRE

Rope and Cables for Inclined Planes, Standing Ship Rigging, Mines, Cranes, Tillers etc., by

JOHN A. ROEBLING, Civil Engineer, Pittsburgh, Pa.

These Ropes are in successful operation on the planes of the Portage Railroad in Pennsylvania, on the Public Slips, on Ferries and in Mines. The first rope put upon Plane No. 3, Portage Railroad, has now run 4 seasons, and is still in good condition.

2v19 1y

# NORRIS' LOCOMOTIVE WORKS.

BUSH HILL, PHILADELPHIA, Pennsylvania.

**M**ANUFACTURE their Patent 6 Wheel Combined and 8 Wheel Locomotives of the following descriptions, viz:

Class	1,	15 inches Diameter of Cylinder,	× 20 inches Stroke.
"	2,	14	" " " × 24 " "
"	3,	14½	" " " × 20 " "
"	4,	12½	" " " × 20 " "
"	5,	11½	" " " × 20 " "
"	6,	10½	" " " × 18 " "

With Wheels of any dimensions, with their Patent Arrangement for Variable Expansion.

Castings of all kinds made to order: and they call attention to their Chilled Wheels, for the Trucks of Locomotives, Tenders and Cars.

NORRIS, BROTHERS.

**K**EARNEY FRIE BRICK. F. W. BRINLEY, Manufacturer, Perth Amboy, N. J. Guaranteed equal to any, either domestic or foreign. Any shape or size made to order. Terms, 4 mos. from delivery of brick on board. Refer to

**T**HE NEWCASTLE MANUFACTURING Company continue to furnish at the Works, situated in the town of Newcastle, Del., Locomotive and other steam engines, Jack screws, Wrought iron work and Brass and Iron castings, of all kinds connected with Steamboats, Railroads, etc.; Mill Gearing of every description; Cast wheels (chilled) of any pattern and size, with Axles fitted, also with wrought tires, Springs, Boxes and bolts for Cars; Driving and other wheels for Locomotives.

The works being on an extensive scale, all orders will be executed with promptness and despatch. Communications addressed to Mr. William H. Dobbs, Superintendent, will meet with immediate attention. ANDREW C. GRAY, a45 President of the Newcastle Manuf. Co.

**R**AILROAD IRON AND LOCOMOTIVE Tyres imported to order and constantly on hand by A. & G. RALSTON 4 South Front St., Philadelphia. Mar. 20th

**VALUABLE PROPERTY ON THE MILL Dam For Sale.** A lot of land on Gravelly Point, so called, on the Mill Dam, in Roxbury, fronting on and east of Parker street, containing 68,497 square feet, with the following buildings thereon standing.

Main brick building, 120 feet long, by 46 ft wide, two stories high. A machine shop, 47x43 feet, with large engine, face, screw, and other lathes, suitable to do any kind of work.

Pattern shop, 35x32 ft. with lathes, work benches, Work shop, 86x35 feet, on the same floor with the pattern shop.

Forge shop, 118 feet long by 44 feet wide on the ground floor, with two large water wheels, each 16 feet long, 9 ft diameter, with all the gearing, shafts, drums, pulleys, &c., large and small trip hammers, furnaces, forges, rolling mill, with large balance wheel and a large blowing apparatus for the foundry.

Foundry, at end of main brick building, 60x45½ feet two stories high, with a shed part 45½x20 feet, containing a large air furnace, cupola, crane and corn oven.

Store house—a range of buildings for storage, etc., 200 feet long by 30 wide.

Locomotive shop, adjoining main building, fronting on Parker street, 54x25 feet.

Also—A lot of land on the canal, west side of Parker st., containing 6000 feet, with the following buildings thereon standing:

Boiler house 50 feet long by 30 feet wide, two stories.

Blacksmith shop, 49 feet long by 30 feet wide.

For terms, apply to HENRY ANDREWS, 48 State st., or to CURTIS, LEAVENS & CO., 106 State st., Boston, or to A. & G. RALSTON & Co., Philadelphia. ja45

**T**O RAILROAD COMPANIES AND BUILDERS OF MARINE AND LOCOMOTIVE ENGINES AND BOILERS.

PASCAL IRON WORKS.

**WELDED WROUGHT IRON TUBES**

From 4 inches to 1 in calibre and 2 to 12 feet long, capable of sustaining pressure from 400 to 2500 lbs. per square inch, with Stop Cocks, T, L, and other fixtures to suit, fitting together, with screw joints, suitable for STEAM, WATER, GAS, and for LOCOMOTIVE and other STEAM BOILER FLUES.

Manufactured and for sale by

MORRIS, TASKER & MORRIS.  
Warehouse S. E. Corner of Third & Walnut Streets, PHILADELPHIA.

**T**O LOCOMOTIVE AND MARINE ENGINE BOILER BUILDERS. Pascal Iron Works, Philadelphia. Welded Wrought Iron Flues, suitable for Locomotives, Marine and other Steam Engine Boilers, from 2 to 5 inches in diameter. Also, Pipes for Gas, Steam and other purposes; extra strong Tube for Hydraulic Presses; Hollow Pistons for Pumps of Steam Engines, etc. Manufactured and for sale by

MORRIS TASKER & MORRIS,

Warehouse S. E. corner 3d and Walnut Sts., Philadelphia. 11f

**P**ATENT INDESTRUCTIBLE WATER

Pipes. The subscribers continue to manufacture the above PIPES, of all the sizes and strength required for City or Country use, and would invite individuals or companies to examine its merits.

This pipe, unlike cast iron and lead, imparts neither color, oxide or taste, being formed of strongly riveted sheet iron, and evenly lined on the inside with hydraulic cement. While in the process of laying, it has a thick covering externally of the same—thus forming nature's own conduit of stone. The iron being thoroughly enclosed on both sides with cement, precludes the possibility of rust or decay, and renders the pipe truly indestructible. The prices are less than those of iron or lead. We also manufacture Basins and D. Traps, for Water Closets, on a new principle, which we wish the public to examine at 112 Fulton street, New York.

J. BALL & CO.

**Pennsylvania Coal Trade.**

In our last, we published an excellent article from the "*Philadelphia Commercial List*,"—one of the best papers we know of—and, below, we give another from the same journal, in reference to the Coal Trade of Pennsylvania, etc., which will be found highly interesting.

**Pennsylvania the Pioneer in Internal Improvements.**—**COAL TRADE.**—The State of Pennsylvania has claims which seem to be imperfectly understood by her sisters of the Union. The reason probably is, that those claims have failed of being properly asserted. In the history of valuable discoveries, and of pioneer operations in the great works which are to give character and wealth to our nation, Pennsylvania, and the City of Philadelphia, in particular, is entitled to no secondary place. While all due honor is cheerfully accorded to the city of Boston, for the liberality and successful enterprise of her citizens, justice to Philadelphia demands that there should be, in the comparison, a more distinct remembrance of what she has done, than appears generally to prevail.

The great fact that in all works of Internal Improvement, Pennsylvania has been the pioneer, is one which eminently deserves the consideration of the country. If a wider range of details were taken, it would be interesting to dwell on such facts as these, viz: that the Quadrant was here invented by Godfrey—that here Franklin taught men how to control the lightnings of heaven—that on the Delaware, at Philadelphia, John Fitch first proved the power of his rude steamboat, and that it was Fulton, a native of Pennsylvania, who immortalized his name, by maturing that wonderful invention—that the first Locomotive was set in motion near the corner of Ninth and Market, by its inventor, Oliver Evans, who, with the foresight so often noticed as a characteristic of great discoverers, declared, that the time would come, when one would "breakfast in New York, dine at Philadelphia, and sup at Baltimore." Here also was situated the first Bank established in the country, and the first Insurance Office. Here was organized the first Sabbath School, an honor, surely, to be appreciated throughout the length and breadth of our Union. Philadelphia first showed what might be done in supplying cities with water, by her astonishing Fairmount Water Works. In her Eastern Penitentiary, she furnished a model for Institutions of that class, which has been extensively approved and imitated, both in this country, and in Europe. The first public Hospital in the United States, was the Pennsylvania Hospital. The first Institution for the Blind, was that established in this city. Here, too, before the Revolution, the great discovery which has given us the Magnetic Telegraph, led Franklin to give signals by electricity across the Schuylkill.

In such a review, it might be added, that the merchants of Philadelphia, at an early period, had the patriotism and the liberality, to build a frigate, and present it to the United States Government, the only instance of the kind on record; and the State of Pennsylvania erected a house in Philadelphia, and of-

ferred it as a present to Washington. Here, also, a stand was taken against the exactions of Great Britain, in advance of Boston herself. The first opposition to the landing of Tea was made at a public meeting held in Philadelphia, some weeks before the celebrated tea-party executed its work at Boston.

Last, though not least, should be mentioned the fact known throughout the civilized world, that from Philadelphia came forth the Declaration of Independence.

But the part which Pennsylvania has taken in the great works of internal improvement, evidently needs to be better understood. A thorough investigation of this subject would cause surprise in many quarters, and place the character of our City and Commonwealth in a most honorable position.

It is to be remembered that the surface of this State presents an obstacle in internal improvements, greater than is found in any other. Vast ranges of mountains are to be scaled, because there are no gorges through which roads can pass. Rapid and turbulent streams, which are frequently swollen by the rains and snows of the mountains, often carry destruction in their course. Yet the mountains have been scaled by our turnpike roads, and substantial and costly bridges have been thrown over the thousand streams. In the extent and cost of her turnpikes, Pennsylvania has long been in advance of all her sister States. The turnpike from Philadelphia to Lancaster, was the first undertaken in the Union, and was completed in 1794, at a cost of \$465,000. Subsequently, the whole surface of the State was traversed by these roads. But the day of turnpikes has passed away; and the famous Conestoga wagons, with their noble six-horse teams, whose bells sounded along the mountain defiles, and warned the traveller of their approach, are to be reckoned among the wonders of Pennsylvania, as it was.

The Bridges of this State, have been accounted one of its remarkable features. The Schuylkill "Fairmount Bridge," erected in 1798, at an expense of \$300,000, was the first great work of the kind contemplated in this country. The first Fairmount bridge, with its span of 348½ feet, outrivalling the famous bridge of Shauflhausen, and the Wire Bridge erected in 1817 at the Falls of the Schuylkill, which served to suggest the idea to European builders, were an honor to Philadelphia. The bridges in the interior, by their number, and their substantial, and even bold character, have done honor to the State.

For the introduction of Canals, as well as Turnpikes, to the public attention, the country is indebted to Pennsylvania. Even William Penn seems to have meditated on the project of connecting the Susquehanna with the Schuylkill; and in 1762, David Rittenhouse and Dr. William Smith surveyed a canal route for the purpose. At that early day, these gentlemen had in view the connecting of the Lakes and the Ohio Canal with the Delaware, by a route of nearly 600 miles! The survey, under the authority of the Legislature of Pennsylvania, was ac-

complished in 1769. In 1791, a company was incorporated for connecting the Susquehanna and the Schuylkill; and in 1792, another was incorporated for connecting the Schuylkill with the Delaware, by way of Norristown. At the head of the latter was Robert Morris, the celebrated financier. These two companies undertook the work, and proceeded far with it, when, having expended \$140,000, they were embarrassed, and suspended operations, a number of the leading individuals having become bankrupt in this Herculean effort. These beginnings, however, resulted at length in the completion of the Union Canal. The first Tunnels excavated in the Union, were in Pennsylvania. The first survey of the Chesapeake and Delaware Canal, was made in 1769, by order of the American Philosophical Society; and as early as 1804, \$100,000 were expended in the execution of the work.

When the period of Railroads arrived, Pennsylvania was again the pioneer. The Railroad at Mauch Chunk, constructed with Philadelphia capital, was the first in the Union; or, at least, was anticipated only by a short tram-road at Quincy, Mass. From that period to the present, Philadelphia has been second to no city in the Union, in expenditures for constructing these wonderful annihilators of time and space.

THE COAL TRADE OF PENNSYLVANIA is attracting, more and more, the attention of the country. No thinking person can contemplate its progress, without being deeply impressed with the importance, to our Union, of the State in which such vast resources of fuel are found. Were Pennsylvania annihilated, with all her mountains of Coal and Iron, how melancholy would be the condition of her surviving confederates, in regard to those two grand requisites of civilized life.

If the importance of the Coal Trade is inconceivably great, its progress has been astonishing. Anthracite Coal was first used as fuel (on tide water) in 1820, and the total supply then sent to market, was 365 tons! a quantity much smaller than that now annually consumed by hundreds of single establishments. We now find a single Iron Manufacturing Company, in our State, consuming 60,000 tons of Anthracite, and 100,000 bushels of Bituminous Coals, annually.

From being regarded as a doubtful article of combustion at all, anthracite coal has come to be largely used for domestic purposes, for the production of steam in manufacturing establishments, for propelling steamboats and railroad locomotives, and more recently for the manufacture of iron, for which purpose it is employed on an immense scale. In 1840, there were no anthracite furnaces in full and successful operation. There are now 40 furnaces in blast, many of them of the largest class. Within the last three years, 18 rolling mills have been erected, which consume hundreds of thousands of tons of coal annually. This branch of business, so important in a National view, is destined to increase rapidly, as the demand for railroad iron increases in almost every section of our coun-

try. It is only by collecting details and uniting them, that the extent and importance of the coal trade is made apparent. It has already more than trebled the coasting trade of Philadelphia, and pays, annually, a freight on the shipments coastwise from this port, of more than a million of dollars. If this trade is of such importance in its comparative infancy, what will it be in its full growth?

About the year 1837, a report was made to the government by Maj. Bache, of the Topographical Engineers, on the subject of an artificial harbor or breakwater, at Cape May, in which he states, that the insurable interest created by the Coal Trade passing around Cape May alone, already amounts to more than twenty two millions of dollars per annum, estimating merely the vessels in ballast coming after it, and the value of the vessel and cargo carrying it to the various ports at which it is wanted. Many of these vessels bring us supplies from the ports they come from, at merely a nominal freight, instead of ballast—plaster, fish, lumber, salt, and other articles required for consumption in the interior, which add materially to the resources of the canals and railroads.

In England, coal appears to have been first used as fuel, about the close of the 12th century. In 1239, Henry III. granted a charter to the burgesses, of Newcastle, to dig for coal; which is the first legal mention of the article on record. As early as 1140, we find among the Leges Burgorum, an enactment giving special privileges to the inbringers of fuel, which is described as being wood, turves and peats. The English coal trade, which now amounts to forty millions of tons annually, may indicate to us something of what we have reason to predict in our future career.

Perhaps few persons have distinctly considered the aggregate expenditure to the improvements designed to facilitate the transportation of coal from our vast coal fields. Let us look at some definite statistical account of these operations:

*Names and Cost of the Canals and Railroads leading to the Coal Mines:*

Lehigh Coal Region.	Canals. Length.	Railroads. Length.	Cost.
<i>The Lehigh Navigation</i> —Extends from Easton to Whitehaven, 71 miles, and thence to Stoddartsville, 16 miles, there is an improved navigation.....	87		\$1,555,000
<i>Whitehaven and Wilkesbarre Railroad</i> —From Whitehaven to Wilkesbarre, with three inclined planes and one tunnel.....	30		1,350,000
<i>Mauch Chunk Railroad</i> —From Summit and Room Run mines to Mauch Chunk, and back tracks.....	36		600,000
<i>Beaver Meadow Railroad</i> —From the Beaver Meadows to landing on Lehigh canal.....	26		360,000
<i>Hazleton Railroad</i> —To Lehigh Canal.....	10		120,000
<i>Buck Mountain railroad</i> —To Lehigh Canal.....	4		40,000
<i>Summit Railroad</i> .....	2		20,000
Total Lehigh Improvements,	87	98	\$7,045,000

#### SCHUYLKILL REGION.

<i>The Schuylkill Navigation</i> —commences at Philadelphia and terminates at Port Carbon, (including cost for enlarging to this time).....	108		\$5,675,000
<i>The Reading Railroad</i> —Extends from Richmond to Mount Carbon, with a branch from the Falls of Schuylkill to the Columbia Railroad, at Peters Island, including cost of cars, locomotives, etc.....	93		11,000,000
<i>Little Schuylkill Railroad</i> —Between Port Clinton and Tamaqua, cost \$220,000, and new rails now laying, \$220,000.....	20		500,000
<i>Mine Hill and Schuylkill Haven Railroad</i> —Cost \$430,000; new rails and 71 miles extension to Swatara, \$120,000.....	65		550,000
<i>Danville and Pottsville Railroad</i> —Unfinished and only part in use.....	294		680,000
<i>Mount Carbon Railroad</i> .....	7		155,000
<i>Mount Carbon and Port Carbon Railroad</i> .....	21		120,000
<i>Schuylkill Valley Railroad</i> .....	14		300,000
<i>Mill Creek Railroad</i> .....	6		120,000
Railroads constructed by individuals, aggregate.....	70		180,000
Railroads under ground in the mines.....	60		75,000
Total, Schuylkill.....	108	357	\$19,365,000

#### OTHER PLACES.

<i>Lykens' Valley Railroad</i> —To Susquehanna Canal.....	16		\$200,000
<i>Wisconsin Canal</i> —To Millersburg on Susquehanna.....	12		70,000
<i>Swatara railroad</i> —To Union Canal.....	4		20,000
<i>Lorberry Railroad</i> .....	4		20,000
Total, other places.....	12	24	\$310,000

#### RECAPITULATION.

Lehigh Improvements.....	87	98	\$7,045,000
Schuylkill.....	108	214	19,355,000
Other places.....	12	24	310,000
Total.....	207	479	\$36,610,000
To these must be added the Delaware and Hudson Canal, 108 miles long, and Railroad, 24 miles, cost.....			
			\$3,250,000
Morris Canal, 108 miles long, constructed to carry coal to New York, cost.....			
			4,000,000
Total, as above.....			26,610,000
Grand Total.....			\$34,060,000
Total length of Canals, 417 miles.			
Total Railroads.....503 "			

The Coal Trade gives employment to a very great number of persons. Indeed, nearly all the cost of the article is the result of labor. In its locality, it is worth only from 25 to 50 cents per ton; averaging 35 cents per ton. But in all the operations connected with mining and the transportation, a vast amount of labor is employed. We must take into account, not only the miners, and the boatmen and brakemen on the canals and railroads, and the hands on board the transporting vessels, and the cartmen at the places of delivery, but also the thousands employed at the same time, in making the necessary railroads and canals, the locomotives and stationary engines, the boats, etc., etc.

The sums thus invested in providing avenues for the coal trade, may be computed;

but the enhanced value of lands, and the property which appears in smiling villages where once roamed the panther and the bear, baffle all attempts at calculation.

These exhibitions of the extent of the coal trade, and of its importance to the Union, lead us to ask whether this interest has not a claim upon the government for protection and encouragement. If not, how could such a claim be conceived of as possible? What operations can be more intimately connected with the prime elements of National growth and power? What political wisdom can discern the propriety of withholding the protecting power of the government here, unless it be that which denies, altogether, the justice and policy of any restrictions on the disheartening competition of other nations, which is fited to keep back our own enterprises for centuries?

Now, by way of contrast, let us take the total amount of capital invested in all the manufacturing establishments at Lowell, and see how it compares with the above expenditures. During a visit to that remarkable city, last summer, we obtained a copy of the "Statistics of Lowell Manufactures for 1846." From it we learn the following particulars. The amount of capital invested in all the factories, including buildings, machinery, houses for the operatives, etc., is as follows:

Merrimack Manufacturing Co., capital, \$2,000,000	
Hamilton " " " " 1,200,000	
Appleton " " " " 600,000	
Lowell " " " " 600,000	
Middlesex " " " " 750,000	
Suffolk " " " " 600,000	
Lawrence " " " " 1,500,000	
Tremont Mills " " " " 600,000	
Boott Cotton Mills " " " " 1,200,000	
Massachusetts Cotton Mills, " " " " 1,200,000	
Lowell Machine Shop " " " " 300,000	

Total capital.....\$10,550,000

Thus, it will be seen, that the whole amount invested in all the manufactories at Lowell, is less than one third the sum actually expended in constructing avenues for bringing Pennsylvania coal to market.

The number of vessels of all descriptions cleared at Philadelphia and Bristol, laden with Lehigh coal, during the same period, amounted to 1246, carrying 161,282 tons of coal.

Total number of vessels cleared from the port of Philadelphia, in 1846, laden with coal, as far as ascertained, eight thousand three hundred and seven.

Here, then, next to the whale trade, is the greatest nursery for seamen.

The quantity of coal which passed through the Delaware and Raritan Canal, to New York, has been as follows:

1842.....	171,754 tons.
1843.....	198,362 "
1844.....	267,496 "
1845.....	372,072 "
1846.....	339,924 "

On what grounds can our government reasonably hesitate to put forth its best energies for the sustaining of the great coal and iron interest of Pennsylvania—a Pennsylvania interest indeed, geographically, but a National interest in all its great ultimate bear-

ings, if such a thing as a National interest can be known or conceived of.

We feel that such statements as those which we present to our readers this week, must powerfully arrest the attention of thinking men. In thus exhibiting, in accurate statistical manner, the resources and energies of Pennsylvania, we cannot be exposed to the imputation of a vain-glorious spirit; and the information communicated must be new, in a great measure, to most of our readers, and impressive to all. We propose, in a future number, to exhibit, in a full and accurate manner, the iron interest of Pennsylvania.

#### Water for Saratoga.

The facts embodied in the annexed account from the Saratoga Republican, of the recently constructed Water Works of that place, will interest the people of many villages which are not yet, but ought to be, similarly provided for. The Republican says:

The recent experiment of supplying this village with water, has pretty conclusively established the fact that an abundant supply of water may be obtained, and that the indestructible water pipes manufactured by J. Ball & Co., at 112 Fulton street, New York, are decidedly superior to any other yet invented. Unlike cast iron and lead, this pipe imparts neither color, oxide or taste, being formed of strongly rivetted sheet iron, and evenly lined on the inside with hydraulic cement. While in the process of laying, it has a thick covering externally of the same; thus forming nature's own conduit of stone. The iron being thoroughly enclosed on both sides with cement, precludes the possibility of rust or decay, and renders the pipe truly indestructible. The prices are less than those of iron or lead, and persons or associations about to supply themselves with water, will not only find this kind of pipe preferable in every respect, to any other in use, but the patentee, Mr. Ball, who owns the entire right in this State, is an honorable, intelligent and faithful man to deal with. He has nearly finished a contract for laying about \$14,000 worth of pipe for our village, and notwithstanding the doubts previously entertained of its goodness and durability, the undertaking is now regarded with favor by more than nineteen twentieths of our inhabitants. Mr. Ball labored under many disadvantages, in performing his contract with this village. He had three commissioners, five trustees and forty others, to consult in the matter. The trench was neither dug nor covered according to his instructions—it was late in the season before he began the work—he extended it nearly half a mile in the village, when he had agreed to come only to Broadway this Fall—his workmen were mostly strangers to him, and unexperienced in the business, and he was often disappointed in not receiving his materials from New York, in consequence of unreasonable delays upon the river or railroad. Yet, notwithstanding all these embarrassments, he progressed much farther with the work than he had agreed or was expected to by those who employed him. What has been done, appears to be in capital order, although it cannot be expected that the work will be perfect until it is carefully

examined and repaired in the Spring. Even the Croton Water Works, for the city of New York, which are laid in cast iron pipes, require continual guarding and repair.

The long desired object of obtaining a good supply of water is about accomplished. The pipes should be extended and hydrants established in all parts of the village, and if our citizens consult their true interests, they will see that sufficient means are promptly provided for carrying the water through all the principal streets with the opening of Spring. The \$10,000 loan is about expended, an account of which, with the vouchers, will soon be exhibited by the commissioners.

The trustees have pledged \$280 per annum of the water rents, being the annual interest on \$4000 more and making the whole investment \$14,000. With this, the pipe is to be extended some — feet next spring; and when this is done, the work must stop unless additional funds are provided. 'Tis true, the trustees might pledge \$20 per annum more of the water rents, and thus perhaps, expend \$285 71 more than the \$14,000, but this would be the limit to which they can go, the residue of the water rents over and above the \$300, being pledged by the law toward extinguishing the principal of the \$10,000 loan. The trustees have become obliged to Mr. Ball & Co., to apply to the legislature for a law authorizing an additional loan of \$4000, and thus relieve the \$280 water rents from the pledge for laying the pipes. What objection can there be to increasing the loan from 14,000 to \$18,000? This would extend the water to every desirable part of the village, and locate a hydrant on the corner of all the principal streets—an objection of the utmost importance to every tax payer in town. One destructive fire, such as we have frequently had, would destroy more property than the cost of the whole water works; and by locating hydrants at suitable points, fires would be less frequent and less disastrous—rates of insurance would no doubt be reduced—real estate would be increased in value, and the inducements to make investments at Saratoga, would be proportionably multiplied. The want of a good supply of water has been a serious obstacle to the prosperity of our village. Our citizens have felt it—strangers and visitors have observed it; and now that it is ascertained that first rate water for all purposes, can be obtained, we should be inexcusable in delaying to profit by the enterprise. Nor should we stop with a partial or unequal distribution of these benefits to the more central parts of the village. All are required to pay their full proportion of the tax, and all should be allowed to participate in the privileges to be gained from the undertaking. Those whose property is located in the immediate vicinity of the hydrants, who enjoy the privileges of the water, should show their liberality by uniting with their less favored neighbors in an application to the legislature to extend the works to all parts of the village. Many of them, no doubt, will do so, and we have yet to learn that any man will be so selfish or unreasonable as to oppose a project designed to be a lasting benefit to our citizens at large.

We find in the Railway Chronicle for December 26, the following interesting trial in the Rolls on Steamboat Engagements:

The decision of Lord Langdale in the Rolls Court, on an application to dissolve the injunction granted at the instance of a proprietor, against the Eastern Counties company, to restrain the latter from completing the agreement entered into with the Harwich steam packet company, is of considerable interest. The observations of his lordship on the merits of the case are exceedingly clear and decisive. They expressly declare that the employment or engagement of the funds of a railway corporation for purposes not contemplated in the Act by which it exists—whatever may be the advantage expected to accrue from this use of them—is contrary to law, although it may have been established in practice. That neither the director nor a majority of the shareholders, can legally impose on any railway proprietor liabilities foreign to the declared object of the partnership, as defined by the company's Act: that the objects of a railway company are confined to the making, maintenance and working of the traffic of the railway itself except where power to transact other business or enter into other agreements is expressly given: that, allowing reasonable latitude in the construction of the terms by which the general purposes of the railway (including the promotion of its traffic) may be interpreted—a latitude sufficient to meet the objection that a strict reading of the law would forbid a variety of minor arrangements conducive or necessary to the business—it could not, by the largest interpretation, include the support of another company, engaged in a speculation of a different kind, and liable to serious risks—nor authorize the adoption or guarantee of the liabilities of any such foreign enterprise. On these grounds, the Judge refused to dissolve the injunction.

**Sheerness.**—The whole of the guns for the old fortifications have now arrived from Woolwich. They are 63 in number, and are of the following descriptions: 4 eight inch guns, 98 cwt. each, 11 feet long; 29 eight inch guns, 66 cwt. each, 9 feet long; 26 six-and-a-half guns, 56 cwt. each, 9 feet 6 inches long, and 4 six and a-half inch guns, 32 cwt. each, 6 feet 6 inches long. The workmen now await the arrival of the carriages and platforms from Woolwich: the masonry on which they are to rest is all ready to be laid down. The guns are to be placed as follows: 20 on the Halfmoon Battery at the Point, 13 on the Admiral's platform overlooking the said battery, and the remaining 30 along the works protecting the Barracks. The new works progress rapidly; the battery forming opposite the dockyard yard is now carried to the height of the platform; its further progress has, however, been deferred till the formation of the deep ditch by which it is to be protected, and on which all the workmen are now concentrated. Wooden profiles are now up for another battery, with which this is to be connected by a masonry wall, while to the eastward it will be continued into the bastions extending from the Thames to the Medway.

### A Brief History of the Philadelphia and Reading Railroad.

We find in a late number of the "Philadelphia Commercial List," (published by Col. C. G. Childs, and, by the way, a most excellent journal of its character,) the following succinct and comprehensive description of the origin and progress of the Philadelphia and Reading railroad. This road has now become one of the most important public works in this country, and we have no doubt the facts as set down in the article which follows, may be relied on, as generally correct. Under the management of JOHN TUCKER, Esq., its able president, its prospects are flattering, and we are happy to know, that its business is at this time so valuable, and its prosperity advancing so rapidly as it is. We learn that about one-third the stock of this road is owned in Boston—one-third in Europe—and the remainder by citizens in this city and vicinity. The history of the road, as below, will be read with deep interest, by all who are concerned in this kind of enterprise.

"This railroad was projected in 1833, a charter obtained in 1834, surveys made the same year, and 41 miles put under contract and construction in 1835.

It was originally designed for its present purpose, an outlet, or avenue to market, for the Schuylkill coal region; but its first charter extended only to that town which has the honor of giving it a name, the borough of Reading, 59 miles from its terminus on the Delaware river, near Philadelphia; as the right of constructing a railroad between Reading and Port Clinton, 20 miles, had already been granted to another corporation, the "Little Schuylkill Railroad Company," terminating at the latter point. From insufficient means, this company were unable to extend their road, and yielded their right and charter to the Reading railroad company, who, with a further extension of their charter, beyond Port Clinton to Pottsville, went into an active prosecution of the whole work from Pottsville to the Delaware, 93 miles, under one charter, now known as the Reading Railroad.

Every Pennsylvanian is familiar with the great embarrassments to the business of the country, checking commercial enterprise, disastrous to every branch of industry, and fatal to public and private credit, during the period from 1833 to 1842. Notwithstanding all these difficulties, the friends of this road pushed steadily on with its construction, taxing their energies, their means, and their credit, to the utmost, to insure its speedy completion; and, on the 1st day of 1842, the 1st locomotive and train passed over the whole line, between Pottsville and Philadelphia.

From that date to the present, its business, its revenue, and its credit, have increased, in a degree scarcely paralleled by any similar improvement, until its tonnage and receipts are measured, as at present, by millions.

Two continuous tracks of railway extend the whole distance of 93 miles, from Mount Carbon, near Pottsville, to the Delaware river, three miles above the heart of the city of Philadelphia; with a branch also laid with a double track  $1\frac{1}{2}$  miles long, connecting, by the State road, with the principal business street of the same city, for the passengers, merchandise, and city coal business. The rail used is of the H pattern, with both top and edges alike; and weighs 41 $\frac{1}{2}$ , 52 $\frac{1}{2}$  and 60 lbs. to the yard; the lightest having been first, and the heaviest last used. A few tons of other rails, purchased before a further supply of the pattern adopted for the road could be obtained in England, and varying from 51 to 57 lbs. per yard, are also in use.

The track is laid in the most simple manner, the lower web, or base of the rail, being notched into 7 by 8 white oak cross-sills, and these laid on broken stone, 14 inches deep, and well rammed. This method is found admirably calculated for the enormous tonnage of the road, being rapidly and economically repaired and replaced, securing a thorough drainage and preserving its line and level true, at all seasons of the year.

The grades of this road are the chief elements of its success in revolutionizing public opinion on the subject of the carriage of heavy burdens by railway. From the most important branch coal-feeder of the

road, at Schuylkill Haven, to the Falls of Schuylkill, a distance of 84 miles, the grades all descend in the direction of the loaded trains, or are level; with no more abrupt descent, than 19 feet per mile. At the Falls, an assistant locomotive engine, of great power, pushes the train, without the latter stopping, or any delay, up a grade of 42 $\frac{1}{2}$  feet per mile for four-tenths of a mile, leaving it on a descending grade, within four miles of Richmond, whither it is readily conveyed by the same engine which started from Pottsville, never leaving her train.

The bridges on the line, are of great variety in plan and material of construction, stone, iron and wood. The most perfect and beautiful structure on the road, if not in the State, is a stone bridge over the Schuylkill near Phoenixville, built of cut stone throughout, with four circular arches, of 73 feet span, and 16 $\frac{1}{2}$  feet rise each, at a cost, with ice-breakers, of \$47,000. There are 75 other stone bridges and culverts, varying from 6 to 50 feet span; all of circular arcs, spanning water-courses, branches of the Schuylkill and roads. There are seven bridges from 25 to 39 feet span each, built of iron, trussed after the "Howe" plan, with wrought iron top, and bottom chords, wrought iron vertical ties, and cast iron diagonal braces. These bridges are stiff and light, and present a very neat and handsome appearance. As, however, the floorings are of wood, and therefore liable to decay and accident, they have only been used where the width and depth rendered stone bridges impracticable, the latter being always used in replacing wooden structures, wherever it was practicable. There are 23 long wooden bridges, varying from 61 to 160 feet span, built on various principles, chiefly of lattice work, assisted by heavy arch pieces. Of this latter description, the bridge over the Schuylkill at the falls, is a fine specimen. It is 636 feet long, consisting of 4 spans of 134, two of 152, and one of 160 feet respectively, with its deck 46 feet above the river. There is one bridge built on "Burr's" plan, with double arch pieces of 149 feet span; and one on "Howe's" plan, 156 feet span, also assisted by arch pieces. Besides the above, there are 28 wooden bridges of short spans, from 14 to 39 feet, built of King post, Queen post, "Howe's truss" and joists.

There are four tunnels on the road. The longest of these is near Phoenixville, 1,934 feet long, cut through solid rock, worked from five shafts, and two end breasts; deepest shaft 140 feet; size of tunnel 19 feet wide, by 17 $\frac{1}{2}$  high; total cost \$153,000. Another tunnel at Port Clinton is 1,600 feet long, worked from the two ends only; material, loose and solid rock mixed; 1,300 feet are arched; depth below the surface of ground, 119 feet; total cost, \$139,000.—The Manayunk tunnel is 960 feet long, though very hard solid rock, worked from two ends; depth below surface, 95 feet; total cost, \$91,000. Another tunnel, under the grade of the Norristown railroad, and through an embankment of the latter, is 173 feet long, formed of a brick arch, with cut stone facades.

The depots on this road, are all substantially built, but with a view to use, rather than ornament. At Schuylkill Haven, three miles from Pottsville, is erected a spacious engine house, round, with a semi-circular dome roof 120 feet diameter, and 96 feet high; with a 40 feet turning platform in the centre, and tracks radiating therefrom, capable of housing 16 second class engines and tenders. At Reading, are located the most complete, extensive and efficient workshops, and railroad buildings of every description, to be found in the country. The company's property covers here, besides the railroad tracks, 36 acres, the greater part of which is already in use, for the various operations required to keep this vast machine in life and motion. The main machine shop is 159 by 70 feet, filled with the most valuable tools and machinery, all made, with the exception of three or four lathes, in the company's workshops, by their own mechanics. Other machine shops, one 87 by 40 feet, are used for fitting iron and brass exclusively.

The iron foundry is 164 by 33 feet, with cupolas. The largest blacksmith's shop is 131 by 31 feet, 57 smith's fires being daily in use in the works, all blown by fans, driven by steam. The main carpenter's shop is 140 by 46 feet, with a pattern shop in the second story.

The iron coal cars, tenders and smoke pipes, are made and repaired in a shop 123 by 83 feet.

A merchandize depot, just completed, is 194 by

84 feet, to accommodate that rapidly increasing branch of business. About a mile below the Reading depot, where the railroad is nearest the river, most efficient water works have been lately constructed, consisting of a reservoir, on the Neversink hill side, 51 feet above the rails, holding 700,000 gallons of water, supplied with a force pump worked by a small steam engine. Attached to this station, are also two separate tracks with coal shutes beneath, 300 and 450 feet long each, for the use of the town; two wood and water stations; a small portable steam engine for sawing wood, a refreshment house for crews of engines stopping to wood or water; a brass foundry, passenger car house, passenger rooms, offices, etc. All the machinery of the main shops and foundry, is driven by a very handsomely finished stationary engine, with double cranks, of 35 horse power, built entirely on the works.

At Pottstown station, 18 miles below Reading, extensive and efficient shops have also been erected, chiefly for work connected with the bridges and track of the road, and work of various descriptions. The principal shops here, are 151 by 81, 101 by 41, and 81 by 44 feet. The first shop is covered with a neat and light roof, built of an arched "Howe truss," forming a segment of a circle, 78 $\frac{1}{2}$  feet span, by 16 feet rise.

At Richmond, the lower terminus of the road, at tidewater, on the river Delaware, are constructed the most extensive and commodious wharves, in all probability, in the world, for the reception and shipping, not only of the present, but of the future vast coal tonnage of the railway; 49 acres are occupied with the company's wharves and works, extending along 2,273 feet of river front, and accessible to vessels of 600 or 700 tons. The shipping arrangements consist of 17 wharves, or piers, extending from 342 to 1,132 feet into the river, all built in the most substantial manner, and furnished with schutes at convenient distances, by which the coal flows into the vessel lying alongside directly from the opened bottom of the coal car in which it left the mouth of the mine. As some coal is piled or stacked in winter, or at times when its shipment is not required, the elevation of the tracks by trestlings, above the solid surface or flooring of the piers, affording sufficient room for stowing 195,000 tons of coal. Capacious docks extend in shore, between each pair of wharves, thus making the whole river front available for shipping purposes; 97 vessels can be loaded at the same moment; and few places present busier, or more interesting scenes, than the wharves of the Reading railroad at Richmond. A brig of 155 tons has been loaded with that number of tons of coal, in 130 minutes, at these wharves.

A very convenient and neat engine house, has lately been erected at this station; it is of a semi-circular shape, with a 40 feet turning platform in the centre, outside; from which tracks radiate into the house, giving a capacity for 50 engines and their tenders of the largest class, the building 302 ft. long on the centre line, by 69 feet wide. It is built in the simple Gothic style, the front supported by cast iron clustered pillars, from the tops of which spring pointed arches, and the whole capped with turretted capping. Immediately adjoining, are built spacious machine and workshops, for repairs of engines and cars, all under one roof, 991 by 63 feet. A visit to this chief outlet of the Pennsylvania coal trade, will give the best idea of its magnitude, and of the various branches of industry connected with it.

The business of this road requires a large amount of running machinery. The latter consists of 71 locomotive engines and tenders, including five in constant use on the lateral railroads in the coal region; 3,020 iron, and 1,539 wooden coal cars; 492 cars for merchandize, and use of road, and 17 passenger cars.

The engines vary from 8 to 29 $\frac{1}{2}$  tons weight; two very powerful engines, of 27 tons weight each are used exclusively on the Falls grade, before mentioned. The iron cars weigh 24 tons, empty, and carry five tons of coal. The average load of each engine, during the busy months of the year, is about 410 tons of coal, (of 2,240 lbs.) The cost of hauling coal on this road, is about 35 cents per ton. Freight or merchandize, 75 cents per ton, and passengers 41 cents each, through. Its grades have chiefly secured this great economy in transportation.

The total length of lateral railroads, connecting

with the Reading railroad, under other charters and corporations, but all contributing to its business, using its cars, and returning them loaded with coal and merchandise, is about 95 miles. Some of these railroads are constructed in the most substantial manner, with the best superstructure at present used in the country.

By the monthly reports which have been made of the business of the company, it appears that the receipts from December 1st, 1845, to October 31st, 1846, have been \$1,707,312 25. The receipts for the remaining month of the fiscal year, which ended Nov. 30th, 1846, will be sufficient to swell the gross receipts to about \$1,900,000.

In the last annual report, the managers estimated that the gross receipts would be, for the same period, \$1,725,000. From this statement, it appears that unless the expenses vastly exceed the estimate given in the same report, the result of the year's business will prove very gratifying to the stockholders.

Correspondents will oblige us by sending in their communications by Tuesday morning at latest.

" " Pottsville, 34	1.40 and 1.20		

Five minutes allowed at Reading; and three at other way stations.

Passenger Depot in Philadelphia corner of Broad and Vine streets. 8tf

### The Iron Trade.

We have received, by the *Sarat Sands*, our London papers to the 18th of January, inclusive, and also an interesting letter from a friend, from which we learn that the prices of iron are fully sustained—and large orders for bars unexecuted, as the limit being below quoted prices, and sellers will not recede. Bars are quoted: Welsh at £9, and Staffordshire £11 a 11 10. Rails average £9 15 a £10. There is evidently an upward tendency, though slight, in the trade—and we are of the opinion that it will advance still further in the course of the current year.

The following statement, in relation to the iron manufacture in Scotland, will be found interesting: There were in blast in Scotland, previous to 1846, 68 pig iron furnaces—24 out of blast, and 4 building. In 1846 ten new ones were erected and put into blast, and 6 new ones building. On the 1st of January, 1847, there were 98 in blast—24 out of use and 12 building.

There were shipped from Great Britain to foreign countries, in 1845, 54,671 tons, and in 1846, 119,100 tons, showing an increase of 64,429; and coastwise, in 1846, 257,861, making the total shipment for that year, 376,951. Local and inland consumption,

for all purposes, 288,049 tons; and stock on hand, December 31, 1846, 145,000 tons—thus showing the make of last year to be 810,000 tons.

It is a curious fact, shown by this statement, that while the export of 1846 was more than double that of the previous year—the amount sent to the United States was only about one-half as great—viz: in 1845, there was shipped to the United States 25,915 tons, and in 1846, only 13,918 tons!

Extract of a Letter from an intelligent friend now abroad, dated "7 Howard Street, Norfolk Street Strand, London, January 18th, 1847."

He says: "I see by the railway papers that the gross increase of receipts last year, i.e. 1846, over 1845, are considerably over £1,000,000, and that upwards of £900,000 of this sum has been yielded by fifteen companies, among which are the Dublin and Drogheda, Eastern Counties, Great Western, South Western, etc. The revenue of the Dublin and Kingstown has decreased—a solitary instance—£3,900. The following great increase of receipts per cent. for small increase of miles, I think fully bears out what you have so often stated in your Journal, i.e. a railway will always create a business which will pay.

	Miles in 1845.	1846.	Increase.	Per cent.
Norfolk railway,	59	70	11 miles*	135

Midland,				7

You will find on page 51, January 9, 1847, of the *Railway Times*, an article on the iron trade, taken from the *London Price Current*—which shows conclusively that the make of iron has fallen off greatly, and that there will not be a supply of railroad iron. It is said that 4,000,000 tons will be required for the British and Irish railways, already passed, and to be passed this session of parliament. If this be so, I do not see that the Pennsylvania iron makers need fear for the result of their investment in the manufacture of iron. The Eastern Counties railroad company are about to build a village on their line, of 300 houses, at a cost of £206,000, the contract having been given to builders in Stratford.—Why cannot all railways leading from cities pursue the same liberal policy, and thereby greatly benefit their interest? They have recently opened a road of about 100 miles in Prussia, between Berlin and Hamburg.

I will send you by the next regular steamer, a book recently published here, containing probably more information upon the subject of railways than any book heretofore published.

Truly your obedient servant,

EDMUND HEDGE."

In the writer of this letter the readers of the Journal will readily recognise the gentleman who has, for so many years, been connected with its publication. Mr. Hedge is well acquainted with the condition and prospects of our American railroads, and he will be apt to look at works of a similar character abroad with a critical eye, and we may therefore expect from him many interesting facts, from which we hope to draw lessons of utility and profit. Of one thing we are certain, and that is, that he will not allow an opportunity to escape him of avail-

\* Agricultural.

ing himself of what may be useful to his countrymen in the extension of the railroad system in this country; and we know of no young man of his age, not a practical engineer, who would be as likely to gather as much really useful information on the subject as Mr. Hedge—and we hope, therefore, that he may be successful in his present pursuit, and thus be able to visit most of the public works in Europe—as we understand he proposes to do before he returns.

### Progress of our Railroads.

The "Hudson River Railroad," from New York to Albany, is going forward. The subscriptions, at last accounts, amounted to \$2,000,000. The amount subscribed in Sing-Sing is \$50,000, in Poughkeepsie about \$40,000. The "wide gauge" is talked of for this road—and the subscriptions, thus far, appear very encouraging. The New Yorkers have "waked up" at last, it would seem, and the prospect now is very encouraging for this work.

A competent and distinguished surveyor has been employed for the purpose, and a new route—said to possess great advantages—has been proposed for a railway between Burlington, Vt., and Ogdensburg. The line in leaving Burlington, is to run along the south side of Lake Champlain, until it reaches St. Albans—from thence through Hog Island and St. Albert, in a direct line to Rouse's Point, where every facility is found for the construction of a permanent bridge across the Richelieu; the line then pursues its course through a level track of land, a little to the south and parallel to the divisional line '45, passing through the thriving village of Malone, and from thence taking the direction up on the borders of the St. Lawrence to Ogdensburg.

About 30 miles of the Baltimore and Ohio railroad have lately been newly laid down with a rail 51 pounds to the yard. The effects of this improvement, says a cotemporary, are already manifested in the more early and regular arrival of the trains at both ends of the road, they will be further felt in the reduction of expense in the maintenance of the road and machinery; and the increased safety and comfort of the travellers passing over the line. It has been the intention of the company to extend this road to Wheeling: but the president, Mr. McLane, in a recent letter, expressed doubt of the practicability of the route, and encourages its extension to Pittsburg.

The railroad from Burlington to Brandon, Vt., has been contracted for at \$7,300 per mile—a distance of fifty miles. The lowest estimate made by the engineer who located the road, was \$14,500 per mile! The amount for which it has now been let out, is considerably less than any one supposed it could be built for.

The annual meeting of the Champlain and Connecticut river railroad was held at Rutland, Vt., on the 13th inst. Hon. Timothy Follett, of Burlington, was re-elected president. The division from and including the summit at Mount Holly to Bellows Falls, about 35 miles, is contracted for at something less than \$12,000 per mile, on the same conditions as above set forth. The executive committee were directed to take measures for contracting for the remaining section of 31 miles, from Brandon to Mount Holly, in season to have the grading completed by January 1, 1849. It is expected that the grading, masonry and bridging of this division, will be let at a price not far from \$1,100 per mile.

The Danvers (Mass.) Courier says, that measures are being taken to have the stock on the road taken up with great hopes of success. Should the road be constructed from Danvers to Boston, it will

be but a few years before all the Newburyport travel will pass through Danvers, a road from Danvers to Georgetown only being needed.

We learn by the Newburyport Herald, that a meeting of those interested in the construction of a railroad from Newburyport to Haverhill, was held at Newburyport on the 8th inst., at which a committee was chosen to procure subscriptions to the stock. The road is designed to go through Georgetown and Bradford, and will be 15 miles in length.

The Northern (N. H.) railroad company have entered into a contract with R. H. Campbell, Esq., of Philadelphia, to construct the bridge across Connecticut river, near the mouth of White river, to connect the Northern and Central roads.

Several petitions have been presented to the New York Legislature for plank roads from Rochester to Greece, to Churchville, to West Henrietta, and to Brighton. The stock is all subscribed for the Rome and Oswego plank road. It is to be commenced immediately.

The Claremont Eagle says that the Sullivan road, connecting with the Vermont Central at Windsor, will be completed by the 1st of January, 1848.

The net earnings of the Norwich and Worcester company in 1846, were over \$90,000, or nearly six per cent, but the loss of the steamer Atlantic has absorbed \$70,000 of it.

The receipts on the Western railroad for the two months ending January 31st, 1847, as compared with the corresponding months the previous year, show an increase of \$33,133 82, viz:—Two months ending January 31, 1847:

Passengers.	Freight.	Other resources.	Total.
\$50,008 93	109,680 54	4,949 66	164,638 13

Two months ending January 31, 1846:			
\$58,717	77,543 69	5,242 69	131,504 31
			\$33,133 82

#### Great Central Railroad from Philadelphia to St. Louis.

BY JOHN A. ROEBLING, C. E.

Written for the Railroad Journal, and read before the Board of Trade of Pittsburg.

Railways appear to be destined to supersede all other means of intercommunication. Among the great mass of modern inventions and improvements, none perhaps are of greater importance, and will contribute more to the great and common interests of mankind, than RAILROADS and TELEGRAPHS. It is not improbable, that in a country like Russia, whose Autocrat has ordered the construction of railways upon a gigantic scale, this system of iron bands may first prove another powerful mode of enslaving more thoroughly the masses of the people, but it will surely aid in their eventual emancipation. Railroads and Telegraphs may be hailed as the latest offspring of the spirit of the present age; they have imparted a new and most powerful impulse to the social movement, from which will yet flow a vast train of beneficial results.

One of the best proofs of the advancement of mankind in true civilization is, that the industrial efforts of nations are no longer squandered upon the creation of vast monuments of pride and of war. The partial attempts at improvements during the middle age, have been followed by a generous rivalry among nations, states, and communities, in the construction public works of general utility and of vast extent, particularly highways, canals and railroads. So far has this system been successfully developed, that we may project works with unerring certainty in advance of population and traffic. In place of railroads growing out of commerce and wealth, the former are now creating the latter. Like a magic

wand, they open the slumbering resources and long-hidden treasures of the earth; convert stone and iron into gold; draw into bonds of union and amity isolated individuals, as well as communities and nations; unchain long-cherished prejudices and selfishness, and cause to be made more simultaneous exertions, in all that is useful and good. The nobler feelings and sentiments of man are likewise partaking of the benefit of this general move; they will be roused to greater activity by the enlarged scope rendered accessible by the increased facilities of communication.

While canals and turnpikes (ever since their general introduction) have experienced but little improvement, because they are not susceptible of it—railroads, on the other hand, have undergone a constant change towards the better. Since their nature admitted the application of mechanical power, they have largely partaken of the benefits, which have resulted from the late astonishing developments of mechanical science. To the successful application of the mighty agency of steam, the vast extension of the great usefulness of railroads is mainly to be attributed; time itself and space have almost been annihilated. But, I may well ask, where is the country on earth, as much to be benefited by these modern improvements, as our own? We abound in the elements of wealth, but want the means of moving, working and distributing them! Inexhaustible supplies of coal and iron invite us to use and apply them for the construction of these and other useful works of art.

The geographical features of the Mississippi valley, it is said, afford the best guarantee for the stability of this Union. But I think, that with greater confidence yet, we may entrust the future fate of our country to that great net of railways and telegraphs which soon will spread over the vast extent of its surface. No less valuable will this network prove, in a political and national point of view, in case of war. From the rapidity and certainty of conveyance, which railways afford, at all seasons of the year, they will serve as the most effective means for the concentration of troops, at points where they are wanted, and for the rapid transportation of supplies. An invasion by the most powerful enemy can be repelled with little effort. Railroads, in fact, will vastly contribute to prevent long protracted wars—civil, as well as national.

The GREAT CENTRAL RAILROAD, as I would term it, proposed to be constructed from Philadelphia to St. Louis, presents itself among similar projects of the day, foremost to the serious attention of the citizens of Pennsylvania—and with peculiar force to the citizens of Philadelphia and Pittsburg. The storm of last year having subsided and given place to a calm, favorable to the discussion of a magnificent enterprise, it becomes now our duty to consider what is the true interest of the two cities which are members of the same commonwealth; and to bring about a mutual understanding, while there is yet time. The question before us is no less than the organization of a company for the construction of a continuous railroad from tidewater to the Mississippi, or from Philadelphia to St. Louis, through the centre of Pennsylvania, Ohio, Indiana and Illinois. The whole west is invoked to assist us in this vast work, which is destined at some future day to become one of the greatest thoroughfares on the face of the globe. Preliminary steps have already been taken for the consummation of one part of this enterprise. The object of the following remark is, to advance the good cause by a candid examination of its merits.

In surveying the geographical features of the vast extent of country which is to be traversed by the contemplated railroad, we discover, that it may be located nearly through the centres of four of the richest states of the Union, Pennsylvania, Ohio, Indiana and Illinois, with an aggregate population of nearly seven millions. The whole extent of road to be constructed will be found to be within nine hundred miles. No railroad has ever been undertaken, which offers to the projectors more magnificent prospects of success. Let us look at it for one moment. Here is the city of Philadelphia forming the eastern terminus, concentrating within herself immense resources and wealth, capable of importing and exporting to any extent, and already the centre of a great manufacturing district. From this city, advancing west, we pass through the centre of Pennsylvania, by the way of Harrisburg, to Pittsburg, the great workshop of the west, the Birmingham of America. Here we meet a population of 65,000, and a vast commercial and industrial business, which will, in course of time, extend beyond any calculation which now can be made. Let us only remember, that there is no point on the face of the globe, and this is asserted without admitting a single exception, which is better calculated than Pittsburg and the surrounding country, for the production and manufacture of iron and machinery. This business is yet in its infancy, but will steadily increase with the population of the valley of the Mississippi. To support the above statements, I will mention, that the prospects of Pittsburg are based upon two solid foundations, which time itself cannot wear out. One is formed by the inexhaustible beds of the best quality of bituminous coal, the other by the veins of excellent iron ore discovered throughout the surrounding country.

The products of that immense industry of Philadelphia, Pittsburg, and of the greater part of Pennsylvania, are to be carried to the west by the proposed railway, to be exchanged for the rich agricultural productions of that fertile country. The travel and intercourse which will naturally grow out of this business, will be conducted by this route at all times of the year speedy and safe. The main stem of this road is to be continued from Pittsburg—not to the lake, this would at present be a great mistake—but by the most direct course to Columbus in Ohio, thence to Indianapolis in Indiana, and by way of Terre Haute and Vandalia, to St. Louis in Missouri. The object of this route is, to traverse the three great western States, Ohio, Indiana and Illinois, and terminate at St. Louis, which city is destined to become the emporium of the great valley. The principal part of the business and travel of these States will, as far as it can be directed east, be attracted by this road, legitimately, and without any farther effort, and will be safely retained for the future.

To insure to this road the travel and business of these States, and to make it triumph over its competitors north and south, its location as well as construction must be undertaken and conducted upon a plan, fully commensurate to the great objects to be gained. The business of the west is within our reach, we can grasp and retain it with unerring certainty, provided we start and act systematically throughout. The means we should employ are to be fully adequate to the magnitude of the object we have in view. Narrow, timid minds never solved a difficult problem, nor did they ever engage in a great and bold enterprise, without abandoning it in despair.

In order to consummate this great undertaking,

all the spare resources of Philadelphia and of Pittsburgh are to be appropriated, and just in proportion as investments will be made, boldly but judiciously, will they be rewarded in return. This proposition is susceptible of the strongest proof. No half measures will in this case answer the end; insufficient capital, and unskillfully applied, may start the enterprise, but will not succeed in carrying through successfully, and maintaining it against the vigorous competition of powerful neighbors.

To be better enabled to judge correctly, I propose to take a general view of the unprecedented spectacle which at this period is presented by the generous rivalry of the States of Virginia, Maryland, Pennsylvania, New York and all the Eastern States, to secure the trade of the Great West. The people of Maine, New Hampshire, Vermont and Lower Canada, have engaged in the construction of the *Atlantic and St. Lawrence* railroad, which is to connect Portland in Maine, with Montreal in Canada. This road, once completed, will make Portland the second seaport in the east; it will become the principal port of entry for the St. Lawrence country, and will rival with Boston and New York in the trade of lake Ontario and lake Champlain.

The next great route of importance, and partly commenced, leads from Boston by way of Concord to Burlington on lake Champlain, thence to Odensburg on the St. Lawrence. It is to secure to Boston the trade for which Portland is making an effort.—It is expected that the local business on the latter road will be sufficient to maintain it.

Next comes the Great Western road from Boston to Albany, and its extension to lake Erie by the New York roads. This route claims a little more of our attention, as it will, when completed, come to some extent in competition with our own. The great success of the Western road is well known; it has astonished and alarmed the city of New York, which like Venice of old, never dreamed of the possibility that any part of their so well established business could be diverted. The Western railroad presents a most forcible argument in support of this *new doctrine*, that the best water communications are destined to become subservient to railroads, for travel as well as freight. I draw your attention to this question: if the Hudson river between New York and Albany, the best steamboat navigation in the world, 150 miles in extent, is not capable of commanding the trade and travel exclusively, in competition with a railroad of over 200 miles long, from Albany to Boston, with two high summits and objectionable gradients, what may be expected of the success of steamboat navigation on the upper Ohio, in competition to a railroad well located and with moderate gradients.

Freight is carried by steamboats at the rate of from 2 to 5 cents per 100 lbs. per 100 miles. This is at the rate of from 40 cts. to \$1 per ton per 100 miles. Coal is transported from Pottsville to Philadelphia by railway at less than \$1 per ton per 100 miles.—But whether steamboats charge a few cents more or less, will little influence the transport of the great west, while the saving of transshipment and commission, and the certainty, rapidity and safety of conveyance, are of much greater moment to the merchant and the traveller.

The sagacious citizens of Boston, when they commenced the Western railroad, had matured an extensive plan of operations, which they are now successfully carrying out. They knew that they could divert a portion of the trade of New York, by the construction of the Boston and Albany road.—They were met by the capitalists of Albany, and

have returned their favors by aiding the Auburn and Rochester road. They have succeeded in establishing an uninterrupted railroad communication from Boston to Buffalo. The city of New York with her great natural advantages, looked at their efforts with indifference and contempt, but wondered how their eastern neighbors, whose mercantile sagacity has become proverbial, could forget themselves in undertaking such a visionary scheme, of diverting the trade and travel of the Hudson river!

The real estate of the city of New York, as is stated by various statistical writers, advanced since the completion of the New York canal, from \$100,000,000 to \$252,000,000, when in 1840 the Western railroad was opened. Here progressive increase has since stopped, while the wealth of Boston, during the same period, nearly doubled, which increase, it is admitted by all parties, is principally owing to the success of the Western road.

The great example of Boston cannot be represented to the contemplation of the citizens of Philadelphia and of Pittsburgh with sufficient force. The success of the Western road is unparalleled in the history of railroads. A railway of 202 miles long, with two summits, one of 1400 feet above tide, the other 918 feet, and with grades of 83 feet per mile, is successfully competing with the steamboat navigation of the world renowned Hudson, a distance of 52 miles less than the railroad! Massachusetts has by a bold stroke appropriated to herself a share in the trade of New York, which was created at an expense of \$30,000,000 by the construction of the New York canals! The plan of Boston is, to extend their route direct from Rochester to the Niagara river, crossed below the falls by means of a bridge, and connect with the Western railroad in Upper Canada, which is to be commenced this year, will join the Central road through Michigan, and be continued to Chicago.

The success of the Western road has roused the energies of New York. A renewed activity on the New York and Erie railroad, and the revival of the proposed Albany railroad, are the consequences.—The roads now in construction and contemplation by New York, will be carried on as rival lines, and nearly parallel to the Boston system. Lake Erie will in a few years be completely encircled by railroads, connecting with Boston as well as with New York.

The trade of the State of Michigan will be monopolized by these two cities. Philadelphia, however, has it within her power to appropriate to herself the greater portion of the lake trade, as far as the trade is now furnished by the States of Ohio, Indiana and Illinois. The shipping business of the lakes is made up by the trade of the surrounding States.—The lakes themselves offer no element of trade except a few fish. If, therefore, by the construction of the proposed Great Central Road from St. Louis to Philadelphia, the western merchant is offered a direct and well constructed railroad to the seaport, in place of the dangerous, tedious and uncertain sea route, he will most certainly avail himself of the former, for travel as well as transportation. It is not from the lakes, which are closed five months in the year, but from the surrounding country, that we expect to derive the support of our road.

We are apt to mistake effects for causes. By removing or changing the latter, we are certain to control the former. This principle applied to the lake trade, we discover, that by the construction of the proposed road, which will intersect nearly all the present avenues to the lakes at right angles, we shall at once strike at the main roots of this trade.

The New York canal has been, and is yet, the great feeder and outlet of the lake trade. But this canal, like all others, is destined to be superseded by railroads, and in proportion as this takes place, the shipping of the lakes will be affected. It is not maintained here, that the New York canal will be abandoned as unfit for transportation—being one of the best situated, and when the enlargement is completed, one of the best constructed improvements of the kind, it will be able to maintain itself in competition with railroads. But it will cease to be the exclusive thoroughfare to the west, the greater bulk of transportation will go by railroad. It may be added, that the fast increasing population of the lake country and of the west will eventually furnish ample trade for the support of all the principal lines in operation and proposed.

Public opinion has strongly set in favor of a continuous railroad from Philadelphia to Cleveland via Pittsburg. As far as Philadelphia and the lake are concerned, the connection would be less advantageous than a direct road to the town of Erie. But what can be expected from making either Cleveland or Erie points of termination of a great road, such as is now in contemplation? At the town of Erie we would encounter the opposition of the New York and Erie railroad, (now constructing.) A few miles more or less of railway transportation will not influence trade, as will appear from subsequent remarks. The superior capital and commercial advantages of New York will draw the trade to it; the great tonnage which will pass over the New York and Erie railroad, will allow that company to transport at a low rate, and the consequence will be, that the lake trade will seek the New York market, although by a longer route, in preference to the Philadelphia market.

The result, however, will be very different, when we tap the lake trade at its sources, save several hundred miles of distance, and avoid the risk, danger and delay of lake navigation altogether.

The distance from Philadelphia to Cleveland, by way of Pittsburg and Central route, is .... 467 miles.  
From Philadelphia to town of Erie by the  
Sunbury and Erie route..... 435 "  
From New York to Dunkirk, by N. York  
and Erie railroad ..... 470 "  
From New York to Buffalo, by N. York  
canal ..... 508 "  
From Boston to Buffalo, by railroad ..... 521 "

These distances show that Philadelphia is as well, and better, situated than New York and Boston for participation in the lake trade. With respect to rise and fall, the grades are also in favor of Philadelphia. But the differences between these routes is too trifling, as to exercise a decided influence upon the cost of transportation. The latter will more depend upon other contingencies.

The trade of Ohio, Indiana, Illinois and Missouri, can be secured to Pittsburg and Philadelphia, with positive certainty, by the construction of the great Central railroad. Neither New York nor Boston can undertake to compete with this route, which will intersect all the numerous improvements and lines of transportation, established in the western States, for connecting the Ohio river with the lakes. The business carried over these lines, will be intercepted by the proposed route.

Pursuing a direct course west of Pittsburg, near Steubenville, we will intersect the great Ohio canal, near Salem, and proceeding nearly parallel to it for some distance, we reach Columbus. It will be no exaggeration when I state, that by the extension of our road from Pittsburg to Columbus, we will have

secured one-third of the whole lake trade. The Western Reserve will be pledged to our route; the whole trade of the valley of Michigan, and of the Scioto, and as will be seen directly, of the balance of the State, will be secured. At Columbus we connect with the road to Cleveland, which is contemplated to be constructed, also with the road to Sandusky. Proceeding west, we avail ourselves of the road to Springfield, and connect with the road to Cincinnati. The great aim of the State of Ohio, and of Cincinnati particularly, has been to form communications with Lake Erie, and thereby with the city of New York. If Philadelphia will pursue a judicious policy, she can take the place of New York, in relation to the commerce of nearly the whole of the State of Ohio. Pennsylvania will be readily met by the liberal policy of that State, in granting connections, which will render tributary to our road, nearly the whole of that vast system of improvements which traverse this State in a north and south direction.

Will it not be better policy, in place of making a road from Pittsburg to Cleveland, a point over 100 miles distant from the great centre of trade, to reach that centre directly by a railway, traversing all the active lines of transportation at right angles, and at such a distance from the New York or Lake Erie line, that the latter can never interfere with the free operations of this great route? The future success of the Central road will require one or two branches to Lake Erie, but their construction should not now interfere with the speedy consummation of the main object. Pittsburg is already connected with the lake by two water communications, to which another will shortly be added. The whole tract of the Western reserve might now reach Philadelphia by way of Pittsburg, if such was not prohibited by the high rate of tolls on the Pennsylvania canal.

Let us remember, that Cleveland itself has no resources of trade. It is only one of the depots of the State of Ohio, having derived its importance from the Ohio canal. By intersecting this canal half way between the lake and the Ohio river, we shall secure the greater part of the business now permitted to reach Cleveland. When we consider the charges, delays, damages and risks, incident upon the transportation of produce from the interior of Ohio to the city of New York, by way of Cleveland, Buffalo, and Albany, on which routes, three transshipments and agencies are to be incurred; and we compare this line to the great central route to Philadelphia, without any transshipment, delay, or risk, and consuming only one-fifth of the time; there is little sagacity required to foretell the result.

For the transportation of bacon and flour to the eastern market, and for transportation, the uninterrupted and rapid conveyance by the great Central route, will be preferred to any other, even at a higher rate of charges. With the aid of the electric telegraph, the western merchant can be kept constantly informed of the state of the market; he will, therefore, never risk, but will be ready at all times, to fill an order with certainty within four days notice.—Speculations and injurious fluctuations will then cease, trade will be established upon a more solid basis. It is true that the business of commission, the heaviest drag upon commerce, will be seriously affected by such a change, but just in proportion will the community at large be benefited.

To prove conclusively that the trade of Ohio, which now goes to New York, may be directed to Philadelphia, the following simple statement of facts will suffice:

Distance from Philadelphia to Pittsburg,

by the most approved route, when finally located, will not exceed ..... 330 miles.  
Distance from Pittsburg to Ohio canal by Steubenville ..... 105 "  
Total, from Phila. to Ohio canal ..... 435 "

A charge of 2½ cents per mile per ton of heavy freight, is a high remuneration on a good substantial railroad, with moderate gradients, and doing a heavy passenger business, beside carrying freight. Coal is transported on the Reading railroad, at less than 1 cent per ton per mile. The charges on the Western road are from 1½ to 3 cents per ton per mile; flour on that road is carried 303 miles for 30 cents per barrel. The great Central road will do a heavier business than any other road in the country, except the Reading; it will, therefore, be well enabled to carry western produce at the rate of 2½ cents per ton per mile, or \$10 87 for the whole distance from the Ohio canal to Philadelphia. Lighter and more valuable merchandize will be carried at the rate of from 3 to 4 cents per ton on \$13 05 to \$17 40 for the whole distance—equivalent to 65 cents and 87 cents per 100 lbs. Allowing 10 barrels of flour per ton, this article will be conveyed through at the rate of \$1 08 per barrel.

Now the present average charge for the transportation of 1 barrel of flour by the N. Y. canal from Buffalo to Albany is ..... 60 cents.  
Add to this, charge from Cleveland or Sandusky to Buffalo ..... 20 "  
From Albany to New York ..... 10 "  
Total charge by New York route ..... 90 "

To these charges we have to add the expense of transportation through the State of Ohio, on the one hand to the lake, on the other to the railroad, and we shall find that the great Central route will be cheaper than the New York route.

It is quite evident that the New York lines can never compete with the great Central, for the trade between it and the Ohio river, nor can they aspire to any considerable portion north of the railroad.—To this may be objected, that the charges on the N. York canal will be reduced when the enlargement is finished. This is true, but by the time this is accomplished, we shall be prepared to reduce also the charges on our road. For it is well known, that the capacity of a railroad, for cheap transportation, depends in a great measure, upon the extent of its business, and the great Central road is destined to do the heaviest business in the country.

Neither the New York and Erie railroad, when completed, nor the Boston line, will be able to compete with the great Central; provided, the business on the latter can be sufficiently extended, to admit of lower fares. The distance from the Ohio canal to Philadelphia was stated to be ..... 435 miles. The distance from Cleveland to N. York

by the N. Y. and Erie railroad is ..... 640 "  
From Cleveland to Boston by railroad ..... 740 "

Cleveland is a point nearly opposite to the point of intersection of the Ohio canal by the great Central road; therefore a correct point to start comparisons. The grade on the latter route will not exceed 45 feet; those on the New York and Erie, reach 60 feet per mile, while the Boston route has several grades as high as 83 feet per mile. The conclusion appears to be legitimate, that neither of the northern railroads can come in competition with the great Central, for travel or freight. Owing to its more southern location, this road will be less impeded by snow than its northern rivals—which is also an important advantage.

From Springfield, in Ohio, to Indianapolis, in Indiana, the line of the national road nearly indicates the route to be pursued. Before the State line is reached, the Miami canal will be intersected, and its trade secured. The Whitewater canal in Indiana, which passes through a fertile country, and terminates at Cincinnati, is the next improvement which will be crossed. Indianapolis itself forms a centre from which various lines of improvements diverge, some finished, others in course of construction, others abandoned for the present. The Madison railroad, which leads from this point to Madison, on the Ohio river, is in operation. The capital of Indiana is undoubtedly the best point for attraction as well as distribution.

From Indianapolis to St. Louis, we will have to follow the general route laid out for the national road, by way of Terre Haute and Vandalia. It is gratifying to learn, that the citizens of St. Louis have lately agitated the project of a railroad to Indianapolis. I would propose to open a correspondence, for concerting measures for a simultaneous move in the east as well as in the west, towards the same object. The west feels the want of a good railroad communication with the east. This is the reason why I have headed this article "*The Great Central Railroad from Philadelphia to St. Louis.*"—I wish to draw the attention of our citizens to the necessity of taking preliminary steps for an early construction of the whole line to St. Louis. The States of Ohio, Indiana, Illinois, and Missouri, are all interested in this work, the completion of which is not above their abilities, when ably supported by the east. The citizens of St. Louis are aiming for Columbus, to form a connection with New York.—This is, therefore, the point where the east will have to meet the west.

The idea has been suggested to continue the road from Pittsburg to Beaver, thence diverging to Cleveland and Columbus. But this would be taxing all the immense traffic from and to the Western States with the expense, which the additional distance caused by following the meanderings of the river, would impose. The additional annual expense, to which the business of this road would be subjected, would, in a few years, equal the capital required for the erection of a railroad bridge at Steubenville. A direct road from Pittsburg to Steubenville appears to be feasible by way of Chartiers and Hormann's creek, with grades not exceeding 45 feet per mile.

We have seen that we possess superior advantages over the northern routes in competing for the western trade. But we have also to contend with two formidable rivals in the south, the Baltimore and Ohio railroad, and the great Virginia route, projected from Richmond to Cuyandot, in a direct course to Cincinnati.

I propose, first, to examine, to some extent, the claims of the Baltimore and Ohio railroad. This road is one of the earliest lines commenced in the United States. The stockholders of that company may be denominated the pioneers of railroading. In their attempt to complete a great railroad, at a period when this species of improvements was yet in its infancy, that company has passed through a great ordeal, by sacrificing vast sums of money by way of experiments. Their location from Baltimore to Harper's Ferry, was originally calculated for horse power, and the superstructure laid down with this view. The rapid improvements in the construction of the locomotive engine soon changed the whole aspect of railroads; that location and construction which was good enough for horse power, could no longer serve the improved locomotive. A

partial reconstruction of the road from Baltimore to Harper's Ferry, has become a necessary consequence.

The enterprising citizens of Baltimore are entitled to great credit for their indomitable energy and perseverance, which they have evinced in the construction of the great improvement in question.—Considering their resources, they have done more than any other community in this country. They have, in fact, attempted too much. The emporium of the little state of Maryland originated the bold idea of extending a magnificent line of railroads through the territory of her neighbors, to connect the Ohio with the Atlantic!

Pennsylvania, as well as Virginia, have at last become aware of the importance of this great project, and they are now viewing it with the eyes of rivals. It was by the generous invitations of the adjoining States, that the city of Baltimore was prompted to make exertions, beyond its strength, in pushing on the enterprise. One branch of the line has been extended to Winchester, the main stem to Cumberland. These, together with the Washington and York branches, in which the company is interested, are doing a fair business and paying well. The stockholders appear to be satisfied with the result of their efforts; they feel that they have exerted themselves to the extent of their ability, and wish to pause; they are unwilling, as well as unable, to proceed in the prosecution of their enterprise for the present. Unfortunately for this company, two great rival routes have been projected with the avowed object of securing the western trade. The ambition and future success of these rivals, will influence the fate of the Baltimore and Ohio; it may delay, and perhaps totally prostrate, their design of completing their line to the Ohio river below Wheeling.

In advocating, as a citizen of Pennsylvania, the interests of the great Central railroad, I am desirous of abstaining from all unjust comment on the Baltimore and Ohio railroad or other rival lines. But as an engineer, who has made the great leading railroad routes, projected through the different States, a professional study, and who is called on by his fellow-citizens to state his views upon these important questions, I feel I should not be doing my duty, by abstaining from all comparisons.

The original design of the Baltimore and Ohio railroad company, was to extend their line to Pittsburgh and to Wheeling. Should they succeed in forming a connection with Pittsburgh, which is now very uncertain, their line would come in direct competition with the great Central. According to their reports and surveys, the distance from Baltimore to Pittsburgh, by the most approved route, will be 340 miles. This route is located along Wills' creek, on the eastern slope of the Allegheny mountain, which is ascended with a grade of 66 feet per mile for 23 miles long, when the *Sand Patch* summit is attained. The western descent commences at the same rate of 66 feet per mile, and continues for five miles long; here the headwaters of Cartleman's river are reached, thence the line continues descending at an easy rate along the Youghiogheny and Monongahela to Pittsburgh.

The surveyed distance from Baltimore to Pittsburgh, by the above route, is... 340 miles.  
The elevation of the Allegheny summit above tide, is... 3290 feet.  
The distance from Baltimore to Wheeling, by the most preferred route, is... 375 miles.  
The distance from Philadelphia to Pittsburgh by the Central route, when finally located, will not exceed... 330 "  
The elevation of the Allegheny summit, above tide on that route, is... 2184 feet.

To save distance on the eastern ascent of the Allegheny mountain, the engineers of the Baltimore and Ohio railroad company have surveyed another route, ascending along Jennings' run, at the rate of 90 feet per mile, and descending with a similar grade, by Flaugheries' run. Since the machinery and working of inclined planes has been so much improved, that all danger and delay can be avoided, it appears, indeed, questionable, whether inclined planes would not be preferable to 90 feet grades on the mountain route of the Baltimore and Ohio.

Few of those persons who have not had opportunities of comparing the maps of the Baltimore and Ohio with those of the Central route, will be found willing to credit the above statement of the relative distances of the two routes. They judge from the geographical position of Baltimore and Philadelphia towards Pittsburg, that the distance by railroad from the latter point to Baltimore, must necessarily be much less than to Philadelphia, without taking into consideration the increase of distance, which may be caused by the greater and smaller windings of the road. The location of the Central road is remarkably straight and direct, while on the other hand the route of the Baltimore and Ohio is exceedingly circuitous in its general courses, as well as in its detail curvature. This was rendered unavoidable by the serpentine character of the river courses which had to be pursued, and by the great obstacles which the steep ascent of the eastern slope of the Allegheny mountain presents to a location.

The passage of the Allegheny Mountains on the Pennsylvania route, on the other hand, is remarkably favorable as to grades and general courses. This can only be explained by the fact, that the mountains slope along the *Little Juniata*, where the line is located, forms a gradual descent, and gives us all the distance required, without deviating much from the general course. From *Logan's Narrows*, which may properly be considered the foot of the eastern slope of the Allegheny mountains on the central route, and which point is elevated 891 feet above tide, we have a distance of 32 miles to the Summit, which is 2184 feet above tide. This elevation, therefore, might be attained at an average rate of 40 feet per mile. The location varies from 26½ feet to 45 feet per mile, with some intervening levels. There are reasons to believe, that by a more minute and thorough examination, these grades can be improved.

The curvature on the central road will be much less than on the Baltimore and Ohio. The total rise and fall of the former, however, will exceed that of the latter. I have not been able to ascertain the precise amount of curvature on the Baltimore and Ohio railroad. The want of this item, therefore, will prevent me from presenting comparative tables of the equated distances of the two routes. The equated distances of the central route are to be found in Mr. Schlatter's report. Truth, however, prompts me to state, that in consequence of the greater amount of rise and fall on the central road, the total equated distance from Pittsburgh to the seaboard, appears to be in favor of the Baltimore route. From this it would follow, that the road will possess an advantage over the central road, in the transportation of freight—but of freight only—provided all the other relations are the same.

The capacities of the two waters, however, approximate so closely, that the success of their rivalry, will entirely depend upon other contingencies, which are independent of grades, curves and distances.

(To be Continued)

#### Incrustation of Steam Boilers.

Nothing perhaps has contributed so much to the occurrence of fatal accidents as explosions arising from the incrustation of boilers. Incrustation may cause explosions in various ways: by forming a layer of non-conducting matter between the metal and the fluid to be heated, and thus allowing the temperature of the former to rise to a high point, even to redness. The metal oxidizes rapidly at this temperature, and the boiler is thereby weakened and rendered incapable of sustaining the necessary pressure. But a more fruitful cause of accidents is the sudden removal of portions of incrustation, when the metal expands on the attainment of the high temperature; the water is thereby brought in contact with the heated metal, and evaporation takes place so suddenly as to resemble the evolution of gasses from the firing of gunpowder. Indeed, the results in both cases are identical. About two years back a Dr. Ritterbandt turned his attention to this subject, and succeeded in discovering a process which does not injure, by its chemical or mechanical action, the metal of the boiler, or other parts of the engine exposed to its influence. The Society of Arts rewarded the ingenious inventor with its gold Isis medal for his discovery. The principle upon which Dr. Ritterbandt's invention is based is the chemical action which the muriate of ammonia exerts upon the carbonate of lime, the incrusting material. Dr. Ritterbandt discovered that by introducing muriate of ammonia into a boiler containing water holding lime in solution, the carbonate of lime, instead of depositing when the carbonic acid by which it was held in solution was expelled at a high temperature, became converted into muriate of lime, a substance eminently soluble, while the carbonate of ammonia, likewise formed by the double decomposition, passed off with the steam, so that the boiler could not foul. The process is equally applicable to fresh and salt water. The inventor has proved, that when sea water is boiled, the incrustation produced is not formed of salt, but of calcareous matter, the salt not depositing until the water has attained a density far beyond that at which the boilers of marine engines are worked. The object of the frequent blowing off which obtains in practice is to prevent the accumulations of the deposited calcareous matter. By preventing the formation of carbonate, by the addition of muriate of ammonia, the necessity of blowing is, to great extent, dispensed with, for while with the best contrived apparatus, it is found impossible to continue working at a density above 20 degrees marine hydrometer, with the plan of Dr. Ritterbandt a density of 60 degrees may be safely employed.—Three-fourths of the quantity of water usually blown out is thus economized, and consequently, that portion of the loss of fuel saved. The soundness of Dr. Ritterbandt's principle has stood the test of time and experience.—Twelve months have elapsed since his discovery was brought under the notice of the public, and in that time its operation has been tried in every variety of way with eminent success—in large and small steamboats, in

stationary and locomotive engines, working with water from all localities, and in every instance has it been found perfectly effective, not merely in keeping the boilers where it has been applied clear of deposit, but in disintegrating that which had formed previously to its application. And we should be wanting in justice to the ingenious inventor, were we not to avow that the invention has been tried for nearly 22 months upon the boilers of the engines printing the "Times," working on an average 17 hours per diem throughout the year. Not only have the boilers been kept perfectly free from deposit, but an incrustation which was formed previously to the application of the invention has been completely removed. We can further state, that neither the boilers nor any part of the machinery has been in any even in the slightest degree, acted upon or injured by the action of the remedy in question.—*London Times.*

**London and York Contract for Rails.**—On Wednesday the two firms of Bailey, Brothers, and the Colebrook Dale Company, took the contracts of the London and York for 35,000 tons of rails, the larger portion by far being taken by Bailey, Brothers. The price was near or about £10 delivered; the rails, we believe, are to be only 72 lb. rails. Sir John Guest, the house of Thompson & Co., and a few others, tendered, but Mr. Crawby declined, not liking, it is said, the conditions of the specification. One of the conditions, it is reported, is, that the engineer, if within 12 months after they are laid down, disapprove of the rails, he may order the contractor to take them back without any appeal from him.—*Herapath.*

**RAILWAY IRON.—THE BEST QUALITY** of English Heavy H Rails—60 lbs. to the yard—now in store, landing from the vessel, and on ship board to arrive, for sale on most favorable terms by  
**DAVIS, BROOKS & CO.,**  
Jan. 2. [11f] 68 Broad St., New York.

**LOCOMOTIVE AND CAR AXLES.**  
The Subscribers are now prepared to receive orders for the well known and approved *Reading Locomotive and Car Axles*—drawn to any required pattern from *Bloom Iron only.* Address  
**SAM'L KIMBER & CO.,**  
Willow Street Wharf,  
Philadelphia, Pa.

**NOTICE TO RAILROAD CONTRACTORS.**  
Proposals will be received at the Office of the Boston and Maine Railroad, No. 60 State street, Boston, until Monday, the 8th day of February next, for the Graduation and Masonry on the line of Road in Andover, between the Merrimack River and a point of intersection with the old Road.  
For examination of profile and work, application may be made at the office of the Engineers, at the Depot in South Andover.

**THOMAS WEST, President**  
Boston and Maine Railroad.  
January 22, 1847. 34

**NOTICE TO RAILROAD CONTRACTORS.**  
Proposals will be received by the Subscriber, at the office of the Michigan Central Railroad Company, at Detroit, until the 16th day of February next, for Grading the first thirteen miles of the Extension of the Michigan Central Railroad, from Kalamazoo, westward; said thirteen miles contains about four hundred thousand cubic yards of earth work. Plans and Specifications will be ready for examination at the office of the subscriber after February 1st.

South Front St., Philadelphia, Pa.  
Have now on hand, for sale, Railroad Iron, viz: 180 tons 2½ x ½ inch Flat Punched Rails, 20 ft. long. 25 " 2½ x ½ " Flange Iron Rails. 75 " 1 x ½ " Flat Punched Bars for Drafts in Mines. A full assortment of Railroad Spikes, Boat and Ship Spikes. They are prepared to execute orders for every description of Railroad Iron and Fixtures. 11f

**RAILROAD IRON.—THE NEW JERSEY** Iron Company, Boonton, N. J., are now preparing to make Railroad Bars, and are ready to take orders or make contracts for Rails, deliverable after the first of December next. Apply to  
**FULLER & BROWN, Agent,**  
No. 139 Greenwich, corner of Cedar street.  
September 18, 1846. 10:39

**NICOLL'S PATENT SAFETY SWITCH** for Railroad Turnouts. This invention, for some time in successful operation on one of the principal railroads in the country, effectually prevents engines and their trains from running off the track at a switch, left wrong by accident or design. It acts independently of the main track rails, being laid down, or removed, without cutting or displacing them.

It is never touched by passing trains, except when in use, preventing their running off the track. It is simple in its construction and operation, requiring only two Castings and two Rails; the latter, even if much worn or used, not objectionable.

Working Models of the Safety Switch may be seen at Messrs. Davenport and Bridges, Cambridgeport, Mass., and at the office of the Railroad Journal, New York.

Plans, Specifications, and all information obtained on application to the Subscriber, Inventor, and Patentee  
**G. A. NICOLLS,**  
ja45 Reading, Pa.

**RAILROAD IRON.—THE SUBSCRIBER'S** New Rail Iron Mill at Phoenixville, Pa., is expected to be ready to go into operation by the 1st of September, and will be capable of turning out 30 to 40 tons of finished Rails per day. They are now prepared to receive orders to that extent, deliverable after the 1st of October next, for heavy rails of any pattern now in use, equal in quality and finish to best imported.

**PIG IRON.**—They are also receiving weekly 150 to 200 tons of No. 1 Phoenix Foundry Iron, well adapted for light castings.

**REEVES, BUCK & CO.,**  
45 North Water St., Philadelphia,  
or by their Agent, **ROBT. NICHOLS,**  
28f 79 Water St., New York

**THE SUBSCRIBERS, AGENTS FOR** the sale of  
Codorus,  
Glendon,  
Spring Mill and } Pig Iron.  
Valley,

Have now a supply, and respectfully solicit the patronage of persons engaged in the making of Machinery, for which purpose the above makes of Pig Iron are particularly adapted.

They are also sole Agents for Watson's celebrated Fire Bricks and prepared Kaolin or Fire Clay orders for which are promptly supplied.

**SAM'L KIMBER & CO.,**  
59 North Wharves,  
Jan. 14, 1846. [1y4] Philadelphia, Pa.

**RAY'S EQUALIZING RAILWAY TRUCK.—THE SUBSCRIBER** having recently formed a business connection in the City of New

York, expressly for the manufacture of the newly patented and highly approved Railroad Truck of Mr. Fowler M. Ray, is ready to receive orders for building the same, from Railroad Companies and Car Builders in the United States, and elsewhere.

The above Truck has now been in use from one to two years on several roads a sufficient length of time to test its durability, and other good qualities, and to satisfy those who have used it, as may be seen by reference to the certificates which follow this notice.

There have been several improvements lately introduced upon the Truck, such as additional springs in the bolster of passenger cars, making them delightful riding cars—adapting it to tenders, trucks forward of the locomotive, and freight cars, which, with its original good qualities, make it in all respects the most desirable truck now offered to the public.

Orders for the above, will, for the present, be executed at the New York Screw Mill, corner 33d street and 3d avenue, (late P. Cooper's rolling mills) and at the Steam Engine Shop of T. F. Secor & Co., foot of 9th street, East

river, (of which firm the subscriber was late a partner) under the immediate supervision of Mr. Ray himself.

Several sets of trucks containing the latest improvements have recently been turned out for the New York and Erie railroad, and the New Jersey Transportation company, which may be seen upon said roads.

The patronage of Railroad Companies and Car Builders is respectfully solicited.

**New York, May 4, 1846.** **W. H. CALKINS, and Others.**  
To all whom it may concern:—This is to certify that the New Haven, Hartford and Springfield railroad co., have had in use six sets of F. M. Ray's patent trucks for the last 20 months, during which time it appears to me, they have proved to be the best and most economical truck now in use.

[Signed,] **WILLIAM ROE, Supt. of Power.**  
I certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Philadelphia and Reading railroad for some time past, under a passenger car.

For simplicity of construction, economy in cost, lightness of material, and extreme ease of motion, I consider it the best truck we have ever used. Its peculiar make also renders it less liable to be thrown off the track, when passing over any obstruction. We intend using it extensively under the passenger and freight cars of the above road.

**Reading, Pa., October 6, 1845.** [Signed,] **G. A. NICOLLS,**  
Supt. Transportation, etc., Philadelphia and Reading Railroad.

To all whom it may concern:—This is to certify that the N. Jersey Railroad and Transportation company have used Fowler M. Ray's Truck for the last seven months, during which time it has operated to our entire satisfaction. I have no hesitation in saying that it is the simplest and most economical truck now in use.

[Signed,] **T. L. SMITH,**  
**Jersey City, November 4, 1845.** **N. Jersey Railroad and Transp. Co.**  
This is to certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Long Island railroad for the last year, under a freight car.

For simplicity of construction, economy in cost, lightness of material and ease of motion, I consider it equal to any truck we have in use.  
**Long Island Railroad Depot,** [Signed,] **JOHN LEACH,**  
**Jamaica November 12, 1845.** 1y19 Supt. Motive Power.

**RICH & CO'S IMPROVED PATENT SALAMANDER SAFES.**

Warranted free from dampness, as well as fire and thief proof.

Particular attention is invited to the following certificates, which speak for themselves:

**TEST No. 10.**

*Certificate from Mr. Silas C. Field, of Vicksburg, Mississippi.*

On the morning of the 14th ult., the store owned and occupied by me in this city, was, with its contents, entirely consumed by fire. My stock of goods consisted of oil, rosin, lard, pork, sugar, molasses, liquors, and other articles of a combustible nature, in the midst of which was one of Rich's Improved Patent Salamander Safes, which I purchased last October of Mr. Isaac Bridge, New Orleans, and which contained my books and papers. This safe was red hot, and did not cool sufficiently to be opened until 16 hours after it was taken from the ruins. At the expiration of that time it was unlocked, when its contents proved to be entirely uninjured, and not even discolored. I deem this test sufficient to show that the high reputation enjoyed by Rich's Safes is well merited.

S. C. FIELD.

**TEST No. 11.—Certificate.**

By the fire which occurred in this village on the 27th July last, our Law Office, together with many other buildings, was destroyed—we had in our office one of Rich's Improved Patent Salamander Safes, which, though heated red hot, preserved, without being the least damaged, many papers valuable to our clients—the envelopes of a few papers being slightly scorched. Some twenty-four hours after the fire, the Safe was removed, and so hot was it, that several hours were required for it to cool off. Our office was in the second story of a large brick building, all the wood used in construction of said house being pitch pine. While the Safe was red hot, one of the walls tumbled in, and so injured the lock that it was necessary to break the door open. From this test, we feel no hesitancy in recommending "Rich's Patent Salamander Safe" as *entirely fire proof.*

GOREE & KING.

Marion, Ala., Sept. 15th, 1846.

*Still other Tests in the Great Fire of July 19, 1845.*

The undersigned purchased of A. S. Martin, No. 138½ Water street, one of Rich's Improved Patent Salamander Safes, which was in our store, No. 54 Exchange place. The store was entirely consumed in the great conflagration on the morning of the 19th inst. The safe was taken from the ruins 52 hours after, and on opening it, the books and papers were found entirely uninjured by fire, and only slightly wet—the leather on some of the books was parched by the extreme heat.

RICHARDS & CRONKHITE.

Benton, Miss., December 27, 1845.

One of Rich's Improved Salamander Safes, which I purchased on the 2d of June last of A. S. Marvin, 138½ Water street, agent for the manufacturer, was exposed to the most intense heat during the late dreadful conflagration. The store which I occupied, No. 46 Broad street, was entirely consumed; the safe fell from the 2d story, about 15 feet, into the cellar, and remained there 14 hours, and when found, I am told, and from its appearance afterwards, should judge that it had been heated to a red heat. On opening it, the books and papers were found not to have been touched by fire. I deem this ordeal sufficient to confirm fully the reputation that Rich's safe has already obtained for preserving its contents against all hazards.

(Signed.)

WM. BLOODGOOD.

New York, 21st July, 1845.

Reference made to upwards of nine hundred and fifty merchants, cashiers, brokers, and officers of courts and counties, who have Rich's Safe's in use.

The above safes are finished in the neatest manner, and can be made to order at short notice, of any size and pattern, and fitted to contain plate, jewelry, etc. Prices from \$50 to \$500 each. For sale by

A. S. MARVIN, General Agent,

138½ Water st., N. Y.

Also by Isaac Bridge 76 Magazine street, New Orleans.

Also by Lewis M Hatch, 130 Meeting street Charleston, S. C.

**FRENCH AND BAIRD'S PATENT SPARK ARRESTER.**

TO THOSE INTERESTED IN Railroads, Railroad Directors and Managers are respectfully invited to examine an improved SPARK ARRESTER, recently patented by the undersigned.

Our improved Spark Arresters have been extensively used during the last year on both passenger and freight engines, and have been brought to such a state of perfection that no annoyance from sparks or dust from the chimney of engines on which they are used is experienced.

These Arresters are constructed on an entirely different principle from any heretofore offered to the public. The form is such that a rotary motion is imparted to the heated air, smoke and sparks passing through the chimney, and by the centrifugal force thus acquired by the sparks and dust they are separated from the smoke and steam, and thrown into an outer chamber of the chimney through openings near its top, from whence they fall by their own gravity to the bottom of this chamber; the smoke and steam passing off at the top of the chimney, through a capacious and unobstructed passage, thus arresting the sparks without impairing the power of the engine by diminishing the draught or activity of the fire in the furnace.

These chimneys and arresters are simple, durable and neat in appearance. They are now in use on the following roads, to the managers and other officers of which we are at liberty to refer those who may desire to purchase or obtain further information in regard to their merits:

R. L. Stevens, President Camden and Amboy Railroad Company; Richard Peters, Superintendent Georgia Railroad, Augusta, Ga.; G. A. Nicolls, Superintendent Philadelphia, Reading and Pottsville Railroad, Reading, Pa.; W. E. Morris, President Philadelphia, Germantown and Norristown Railroad Company, Philadelphia; E. B. Dudley, President W. and R. Railroad Company, Wilmington, N. C.; Col. James Gadsden, President S. C. and C. Railroad Company, Charleston, S. C.; W. C. Walker, Agent Vicksburg and Jackson Railroad, Vicksburg, Miss.; R. S. Van Rensselaer, Engineer and Sup't Hartford and New Haven Railroad; W. R. McKee, Sup't Lexington and Ohio Railroad, Lexington, Ky.; T. L. Smith, Sup't New Jersey Railroad Trans. Co.; J. Eliott, Sup't Motive Power Philadelphia and Wilmington Railroad, Wilmington, Del.; J. O. Sterns, Sup't Elizabethtown and Somerville Railroad; R. R. Cuyler, President Central Railroad Company, Savannah, Ga.; J. D. Gray, Sup't Macon Railroad, Macon, Ga.; J. H. Cleveland, Sup't Southern Railroad, Monroe, Mich.; M. F. Chittenden, Sup't M. P. Central Railroad, Detroit, Mich.; G. B. Fisk, President Long Island Railroad, Brooklyn.

Orders for these Chimneys and Arresters, addressed to the subscribers, care Messrs. Baldwin & Whitney, of this city or to Hinckly & Drury, Boston, will be promptly executed. FRENCH & BAIRD.

N. B.—The subscribers will dispose of single rights, or rights for one or more States, on reasonable terms.

Philadelphia, Pa., April 6, 1844.

•• The letters in the figures refer to the article given in the Journal of June, 1844. ja45

**PATENT HAMMERED RAILROAD, SHIP and Boat Spikes.**

The Albany Iron and Nail Works have always on hand, of their own manufacture, a large assortment of Railroad, Ship and Boat Spikes, from 2 to 12 inches in length, and of any form of head. From the excellence of the material always used in their manufacture, and their very general use for railroads and other purposes in this country, the manufacturers have no hesitation in warranting them fully equal to the best spikes in market, both as to quality and appearance. All orders addressed to the subscriber at the works, will be promptly executed.

JOHN F. WINSLOW, Agent.

Albany Iron and Nail Works, Troy, N. Y. The above spikes may be had at factory prices, of Erastus Corning & Co., Albany; Hart & Merritt, New York; J. H. Whitney, do.; E. J. Eting, Philadelphia; Wm. E. Coffin & Co., Boston. ja45

**MACHINE WORKS OF ROGERS,**

Ketchum & Grosvenor, Paterson, N. J. The undersigned receive orders for the following articles, manufactured by them of the most superior description in every particular. Their works being extensive and the number of hands employed being large, they are enabled to execute both large and small orders with promptness and despatch.

Railroad Work.

Locomotive steam engines and tenders; Driving and other locomotive wheels, axles, springs & flange tires; car wheels of cast iron, from a variety of patterns, and chills; car wheels of cast iron with wrought tires; axles of best American refined iron; springs; boxes and bolts for cars.

Cotton, Wool and Flax Machinery of all descriptions and of the most improved patterns, style and workmanship.

Mill gearing and Millwright work generally; hydraulic and other presses; press screws; callenders; lathes and tools of all kinds; iron and brass castings of all descriptions.

ROGERS, KETCHUM & GROSVENOR, Paterson, N. J., or 60 Wall street, N. York.

**PATENT RAILROAD, SHIP AND BOAT Spikes.**

The Troy Iron and Nail Factory keeps constantly for sale a very extensive assortment of Wrought Spikes and Nails, from 3 to 10 inches, manufactured by the subscriber's Patent Machinery, which after five years' successful operation, and now almost universal use in the United States (as well as England, where the subscriber obtained a patent) are found superior to any ever offered in market.

Railroad companies may be supplied with Spikes having countersink heads suitable to holes in iron rails, to any amount and on short notice. Almost all the railroads now in progress in the United States are fastened with Spikes made at the above named factory—for which purpose they are found invaluable, as their adhesion is more than double any common spikes made by the hammer.

All orders directed to the Agent, Troy, N. York will be punctually attended to.

HENRY BURDEN, Agent.

Spikes are kept for sale, at Factory Prices, by I. & J. Townsend, Albany, and the principal iron merchants in Albany and Troy; J. I. Brower, 222 Water St., New York; A. M. Jones, Philadelphia; T. Janviers, Baltimore; Degrand & Smith, Boston.

•• Railroad Companies would do well to forward their orders as early as practicable, as the subscriber is desirous of extending the manufacturing so as to keep pace with the daily increasing demand. ja45

**DAVENPORT & BRIDGES CONTINUE**

to Manufacture to Order, at their Works, in Cambridgeport, Mass., Passenger and Freight Cars of every description, and of the most improved pattern. They also furnish Snow Ploughs and Chilled Wheels of any pattern and size. Forged Axles, Springs, Boxes and Bolts for Cars at the lowest prices. All orders punctually executed and forwarded to any part of the country.

Our Works are within fifteen minutes ride from State street, Boston—coaches pass every fifteen minutes.

## THE HERRON RAILWAY TRACK,

As seen stripped of the top ballasting

A GOLD MEDAL AWARDED THE INVENTOR BY THE AMERICAN INSTITUTE.

**THE UNDERSIGNED RESPECTFULLY** invites the attention of Engineers, and Railroad Companies, to some highly important improvements he has recently made in the Herron system of Railway structure. These improvements enable him to effect a very large reduction in the quantity of Timber, and cost of construction, without impairing the strength of the Track, or its powers of resisting frost, while they secure additional features of excellence in the Drainage and facility of making Repairs.

The above cut represents the "Herron Track" as it is laid on the Philadelphia and Reading, and on the Baltimore and Susquehanna Railroads. The intersection of the sills of the trellis are 5 feet from centre to centre, while in the new construction they are only 2½ feet. This renders the string piece unnecessary, thus removing the only objectionable feature found in the Track.

The result of experience has proved that all Tracks constructed with longitudinal timbers, such as mud sills, and more especially, the continuous bearing string pieces retain the rain water that falls between the Rails, which, being thus confined, settles along those timbers, and accumulating in quantity flows rapidly along them on the descending grades, washing out the earth from under the timber, and frequently causing large breaches in the embankments of the road. Whereas all water intercepted by the oblique sills of the trellis, is discharged immediately into the side ditches.

In the 5 foot plan, the Track occupies a Road bed nearly 11 feet wide, while the new construction takes

but 8 feet; the timber being more concentrated under the Rails. A block of hard wood, about 2 feet long and 15 inches wide, is introduced into a square of the trellis for the purpose of giving an additional, and effectual support to the joints of the Rails, which rest upon it. Should these joint blocks become chafed and worn by the working, and imbedding of the chairs, as is now the case on all Railroads, they can be readily replaced without any derangement of the timbers less liable to wear.

The following is a general estimate of its cost near the seaboard. In the interior it will be considerably less.

## ESTIMATE OF THE PROBABLE COST OF ONE MILE.

4,224 Timbers, 11 ft. long, 3 x 6 inches =	
68,696 ft. b.m., at \$10 =	\$686 96
587 Oak joint blocks 2 ft. x 3 x 15 in. =	
4,403 ft. b.m., at \$13 =	57 24
13,000 Spikes = 2,250 lbs. at 4½ cts. =	101 25
Workmanship free of patent charge =	600 00

Cost of one mile including the laying of the Rail.....\$1,445 45

He has made other important improvements, which will be shown in properly proportioned models, that give a much better idea of the great strength of the Track than a drawing will do.

Sales of the Patent right to all the distant States will be made on liberal terms.

JAMES HERRON.

Civil Engineer and Patentee.

No. 277 South Tenth St., Philadelphia. 33tf

## ENGLISH PATENT WIRE ROPES—FOR THE USE OF MINES, RAILWAYS, ETC.—

for sale or imported to order by the subscriber. These Ropes are manufactured on an entirely different principle from any other, and are now almost exclusively used in the collieries and on the railways in Great Britain, where they are considered to be greatly superior to hempen ropes, or iron chains, as regards safety, durability and economy. The plan upon which they are made effectually secures them from corrosion in the interior, as well as the exterior of the rope, and gives a greater compactness and elasticity than is found in any other manufacture.

Many of these ropes have been in constant operation in the different mines in England, and on the Blackwall and other inclined planes, for three and four years, and are still in good condition.

They have been applied to almost every purpose for which hempen ropes have been used—mines, heavy cranes, standing rigging, window cords, lightning conductors, signal halyards, tiller ropes, etc. Reference is made to the annexed statement for the relative strength and size. Testimonials from the most eminent engineers in England can be shown as to their efficiency, and any additional information required respecting the different descriptions and application will be given by

ALFRED L. KEMP,

75 Broad street, New York, sole agent in the United States.

Statement of Trial made at the Woolwich Royal Dock Yard, of the Patent Wire Ropes, as compared with Hempen Ropes and Iron Chains of the same strength.—October, 1841.

## AMERICAN RAILROAD JOURNAL.

OFFICE AT THE FRANKLIN HOUSE,  
105 Chestnut Street,  
PHILADELPHIA, PA.

This is the only periodical having a general circulation throughout the Union, in which all matters connected with public works can be brought to the notice of all persons in any way interested in these undertakings. Hence it offers peculiar advantages for advertising times of departure, rates of fare and freight, improvements in machinery, materials, as iron, timber, stone, cement, etc. It is also the best medium for advertising contracts, and placing the merits of new undertakings fairly before the public.

TERMS.—Five Dollars a year, in advance.

Trains leave Frankfort for Lexington daily, at 8 o'clock a.m. and 3 p.m. Distance, 28 miles. Fare \$1-25.

On Sunday but one train, 5 o'clock a.m. from Lexington, and 2 o'clock p.m. from Frankfort.

The winter arrangement (after 15th September to 15th March) is 6 o'clock a.m. from Lexington, and ma. 9. from Frankfort, other hours as above.

35ly

## SUMMER ARRANGEMENT.—NEW YORK

AND ERIE RAILROAD LINE, from April 1st until further notice, will

run daily (Sundays excepted) between the city of New York and Middletown, Goshen, and intermediate places, as follows:

FOR PASSENGERS—

Leave New York at 7 A. M. and 4 P. M.

" Middletown at 6½ A. M. and 5½ P. M.

FARE REDUCED TO \$1 25 to Middletown—way in proportion. Breakfast, supper and berths can be had on the steamboat.

FOR FREIGHT—

Leave New York at 5 P. M.

" Middletown at 12 M.

The names of the consignee and of the station where to be left, must be distinctly marked upon each article shipped. Freight not received after 5 P. M. in New York.

Apply to J. F. Clarkson, agent, at office corner of Duane and West sts. H. C. SEYMOUR, Sup't, March 25th, 1846.

Stages run daily from Middletown, on the arrival of the afternoon train, to Millford, Carbondale, Honesdale, Montrose, Towanda, Owego, and West; also to Monticello, Windsor, Binghamton, Ithaca, etc., etc. Agent on board. 13 if

## NORWICH AND WORCESTER RAILROAD.

Road. Summer Arrangement, commencing Monday, April 6, 1846.

Accommodation Trains, daily, except Sunday. Leave Norwich, at 6 a.m., and 4½ p.m. Leave Worcester, at 10 a.m., and 4½ p.m.

The morning Accommodation Trains from Norwich, and from Worcester, connect with the trains of the Boston, and Worcester and Western railroads each way.

The Evening Accommodation Train from Worcester connects with the 1½ p.m. train from Boston.

New York Train via Long Island Railroad: Leave Allyn's Point for Boston, about 1 p.m., daily, except Sunday.

Leave Worcester for New York, about 10 a.m., stopping at Webster, Danielsonville, and Norwich.

New York Train via Steamboat—Leave Norwich for Boston, every morning, except Monday, on the arrival of the steamboat from New York, stopping at Norwich and Danielsonville.

Leave Worcester for New York, upon the arrival of the train from Boston, at about 4½ p.m., daily, except Sunday, stopping at Webster, Danielsonville and Norwich.

Freight Trains daily each way, except Sunday.—Special contracts will be made for cargoes, or large quantities of freight, on application to the superintendent.

Fares are Less when paid for Tickets than when paid in the Cars. 32 ly

J. W. STOWELL, Sup't.

### TROY RAILROADS.—IMPORTANT NOTICE.

Troy and Greenbush Railroad, forming a continuous track from Boston

to Buffalo and Saratoga Springs. This road is new, and laid with the heaviest iron H rail. Trains will always be run on this road connecting at Greenbush each way with the trains to and from Boston and intermediate places, leaving Greenbush daily at 11 p.m. and 6 p.m., or on arrival of the trains from Boston; leave Troy at 7 1/4 a.m. and 4 1/2 p.m., or to connect with trains to Boston.

Trains also run hourly on this road between Troy and Albany. Running time between Greenbush and Troy, 15 minutes.

### TROY AND SCHENECTADY RAILROAD.

This road is laid its entire length with the heaviest H rail—which is not the fact with the road from Albany. Trains will always be run on this road connecting each way, to and from Buffalo and intermediate places. Leave Troy for Buffalo at 7 1/4 a.m. and 1 p.m. and 6 1/2 p.m., or to connect with the trains for the west; leave Schenectady at 2 1/4 a.m., 8 1/4 a.m., 1 p.m. and 3 1/2 p.m., or on arrival of the trains from Buffalo and intermediate places.

### TROY AND SARATOGA RAILROAD.

THE ONLY DIRECT ROUTE.

No change of passenger, baggage or other cars on this route. Cars leave Troy for Ballston, Saratoga Springs, Lake George and White Hall at 7 1/4 a.m., (arriving one hour in advance of the train from Albany,) and at 3 1/2 p.m. Returning, leave Saratoga at 9 a.m. and 3 1/2 p.m., (reaching Troy in time for the evening boats to New York.) Cars also leave Troy for the Burroughs at 3 1/2 p.m. and 7 p.m., connecting with packet boats for the north. This takes passengers from New York and Boston to Montreal in 44 hours.

N.B. Travellers will find the routes through Troy most convenient and economical, and as expeditious as any other. The steamboats to and from New York land within a few steps of the railroad office, and passengers are taken up and landed by the different railroad lines at the doors of principal hotels, thus saving all necessity for, and annoyance from, hack drivers, cabmen, runners, etc.

Aug 3, 1846.

1y 32

### BALTIMORE AND OHIO RAILROAD.

MAIN STEM. The Train carrying the Great Western Mail leaves Bal-

timore every morning at 7 1/4 and 11 a.m. and 8 o'clock, passing Ellicott's Mills, Frederick, Harpers Ferry, Martinsburgh and Hancock, connecting daily each way with the Washington Trains at the Relay House seven miles from Baltimore, with the Winchester Trains at Harpers Ferry—with the various railroad and steamboat lines between Baltimore and Philadelphia and with the lines of Post Coaches between Cumberland and Wheeling and the fine Steamboats on the Monongahela Slack Water between Brownsville and Pittsburgh. Time of arrival at both Cumberland and Baltimore 5 1/2 P. M. Fare between those points \$7, and 4 cents per mile for less distances. Fare through to Wheeling \$11 and time about 36 hours, to Pittsburgh \$10, and time about 32 hours. Through tickets from Philadelphia to Wheeling \$13, to Pittsburgh \$12. Extra train daily except Sundays from Baltimore to Frederick at 4 P. M., and from Frederick to Baltimore at 8 A. M.

### WASHINGTON BRANCH.

Daily trains at 9 A. M. and 5 P. M. and 12 at night from Baltimore and at 6 A. M. and 5 1/2 P. M. from Washington, connecting daily with the lines North, South and West, at Baltimore, Washington and the Relay house. Fare \$1 60 through between Baltimore and Washington, in either direction, 4 cents per mile for intermediate distances. s13y1

### MANUFACTURE OF PATENT WIRE

Rope and Cables for Inclined Planes, Standing Ship Rigging, Mines, Cranes, Tillers etc., by JOHN A. ROEBLING, Civil Engineer, Pittsburgh, Pa.

These Ropes are in successful operation on the planes of the Portage Railroad in Pennsylvania, on the Public Ships, on Ferries and in Mines. The first rope put upon Plane No. 3, Portage Railroad, has now run 4 seasons, and is still in good condition. 2v19 1y

### NEW RAILROAD ROUTE FROM BUFFALO TO CINCINNATI.

Passengers destined for Columbus and Cincinnati,

O., Louisville, Ky., St. Louis, Mo., Memphis, Tenn., Vicksburg, Natches, New Orleans, and all intermediate ports, will find a new, and the most expeditious and comfortable Route, by taking Steamboats at Buffalo, landing at Sandusky City, Ohio, distance 230 miles.

From thence by Cars, over the Mansfield Railroad which is new and just opened [laid with heavy iron,] to Mansfield, distance 56 "

Thence by Stage via Columbus to Xenia over gravel and Macadamized Road, (the best in the state,) in new coaches, distance 88 "

Thence, over the Little Miami Railroad, from Xenia to Cincinnati, distance 65 "

### TIME.

From Buffalo to Sandusky 24 hours.

Leave Sandusky 5 a.m. to Columbus 14 "

From Columbus to Cincinnati 15 "

Or say 30 hours from Sandusky to Cincinnati over this route, including delays.

### FARE.

From Buffalo to Sandusky, Cabin \$6 00

" " " " Steerage 3 00

" " " " Sandusky to Columbus 4 50

" " " " through to Cincinnati 8 00

Passengers should not omit to pay their fare through from Sandusky City to Cincinnati and take receipts availing themselves of the benefit of a contract existing between the said Railroad and Stage Co's, securing 121 miles travel by good Railroad and 88 miles by Stage, in crossing from Lake Erie to the Ohio river, in the space of 30 hours.

Passengers destined for St. Louis, or any point below on the Mississippi, will save by taking this route, from 4 to 6 days time and travel, and nearly half the expense, over the Chicago and Peoria route to the above places.

Fare by this route, although the cheapest, will in a short time be reduced, Railroad lengthened, and speed increased.

B. HIGGINSON, Sup't, etc.

M. & S. C. R. R. Co.

Sandusky City, Ohio.

### NEW YORK & HARLEM RAILROAD CO.—Winter Arrangement.

On and after Monday, November 23, 1846, the cars will run as follows:

Leave 27th street for 43d street, Deaf and Dumb Institute, Yorkville, Harlem Morrisania, and Williams' Bridge, at 7 o'clock a.m. From City Hall for above named places, 2 p.m. [freight train,] 2 30 p.m. 5 p.m. to Morrisania only.

Leave City Hall for Harlem, Morrisania, Fordham and Williams' Bridge, at 7 45 a.m., and 10 45 a.m.; 1 15 p.m., 2 p.m. [freight train,] 2 30 p.m. and 3 45 p.m.

Leave City Hall for Hunt's Bridge, Bronx, Tuekahoe, Hart's Corners White Plains, Davis' Brook, Unionville and Pleasantville, [Pleasantville 4 miles from Sing Sing,] 7 45 and 10 45 a.m.; 1 15 p.m., 2 p.m. [freight train,] and 3 45 p.m.

### RETURNING.

Leave Pleasantville, at 8, 10, [freight train,] and 11 a.m.; 1 20, and 4 p.m.

Leave White Plains, at 8 12, 10 30, [freight train] and 11 20 a.m.; 1 50, and 4 20 p.m.

Leave Tuekahoe, 8 35, 10 55, [freight train,] and 11 35 a.m.; 2 05, and 4 35 p.m.

Leave Williams' Bridge at 7 45, 8 50 and 11 50 a.m.; 2 20, 4, and 4 50 p.m.

Leave Morrisania 8 and 9 05 a.m.; 12 05, 2 35, 4 20, 5 05 and 6 p.m.

Leave Yorkville, at 8 12 a.m.; 4 35 and 6 15 p.m.

### SUNDAY ARRANGEMENTS.

Leave City Hall for Pleasantville and intermediate places, at 7 45 a.m.; 1 15 and 3 p.m.

Leave Pleasantville for City Hall, at 8 a.m.; 11, and 3 15 p.m.

Leave City Hall for Williams' Bridge and intermediate places, 10 45 a.m.; 3 30 p.m.

Leave Williams' Bridge for City Hall, at 8 50 and 11 50 a.m.; 1, 3 45 and 4 05 p.m. 1y49

### BALTIMORE AND SUSQUEHANNA Railroad.—Reduction of Fare. Morning and

Afternoon Trains between Balti-

more and York.—The Passenger

trains run daily, except Sunday, as follows:

Leaves Baltimore at 9 a.m. and 3 1/2 p.m.

Arrives at 9 a.m. and 6 1/2 p.m.

Leaves York at 5 a.m. and 3 p.m.

Arrives at 12 1/2 p.m. and 8 p.m.

Leaves York for Columbia at 1 1/2 p.m. and 8 a.m.

Leaves Columbia for York at 8 a.m. and 2 p.m.

### FARE.

Fare to York \$1 50

" " " " Wrightsville 2 00

" " " " Columbia 2 12 1/2

Way points in proportion.

### PITTSBURG, GETTYSBURG AND HARRISBURG.

Through tickets to Pittsburgh via stage to Harrisburg \$9

Or via Lancaster by railroad 10

Through tickets to Harrisburg or Gettysburg 3

In connection with the afternoon train at 3 o'clock,

a horse car is run to Green Spring and Owling's

Mill, arriving at the Mills at 5 1/2 p.m.

Returning, leaves Owling's Mills at 7 a.m.

D. C. H. BORDLEY, Sup't.

31 ly Ticket Office, 63 North st.

### CENTRAL RAILROAD—FROM SAVANNAH TO MACON. Distance 190 miles.

This Road is open for the trans-

portation of Passengers and

Freight. Rates of Passage, \$8 00. Freight—

On weight goods generally 50 cts. per hundred.

On measurement goods 13 cts. per cubic ft.

On brls. wet (except molasses

and oil) \$1 50 per barrel.

On brls. dry (except lime) 80 cts. per barrel.

On iron in pigs or bars, cast-

ings for mills, and unboxed

machinery 40 cts. per hundred.

On hds. and pipes of liquor,

not over 120 gallons \$5 00 per hhd.

On molasses and oil \$6 00 per hhd.

Goods addressed to F. WINTER, Agent, forwarded

free of commission. THOMAS PURSE,

y40 Gen'l. Supt. Transportation.

### THE BEST RAILROAD ROUTE TO THE

Lake and Buffalo, from Cincinnati.

Take Cars to Xenia, 65

miles; take Stage to Mans-

field, 68 miles; thence by Cars to Sandusky, 56

miles to the Lake; thence Steamboat to Buffalo, 230

miles.

Fare from Cincinnati to Sandusky \$8 00

" " Sandusky to Buffalo, Cabin 6 00

" " " " Steerage 4 50

Fare by this route, although the cheapest across

the state, will be reduced in a short time, railroad

lengthened, and speed increased.

Leave Cincinnati in the morning, arrive at Col-

umbus at night.

Leave Columbus in the morning, arrive at San-

dusky same day.

Leave Sandusky, by Boat, in the morning, arrive

at Buffalo next morning in time for the Cars north

and east for Niagara Falls, Canada, Saratoga

Springs, Troy, Albany, Boston, New York, Wash-

ington, or Philadelphia.

Passengers should not omit to pay their fare

through from Cincinnati to Sandusky, or from Col-

umbus to Sandusky via Mansfield; as this route is

the only one that secures 56 miles [this road is run

over in 2h. 50m.,] most railroad which is new, and

is the shortest, cheapest and most expeditious across

the state.

Fares on the New York railroads are about to be

reduced. B. HIGGINS, Sup't, etc.

Sandusky, Ohio. M. & S. C. R. R. Co.

### THE SUBSCRIBER IS PREPARED TO

execute at the Trenton Iron Works, orders for

Railroad Iron of any required pattern, and warrant-

ed equal in every respect in point of quality to the

best American or imported Rails. Also on hand

and made to order, Bar Iron, Braziers' and Wire

Rods, etc., etc.

PETER COOPER 17 Burling Slip.

New York.

" " " " Richmond..... 6 60

For Tickets, or further information, apply at the Southern Ticket Office, adjoining the Washington Railroad Office, Pratt street, Baltimore, to 1v14 **STOCKTON & FALLS, Agents.**

**RAILROAD SCALES.—THE ATTENTION** of Railroad Companies is particularly requested to Ellicott's Scales, made for weighing loaded cars in trains, or singly, they have been the inventors, and the first to make platform scales in the United States; supposing that an experience of 20 years has given a knowledge and superior advantage in the business.

The levers of our scales are made of wrought iron, all the bearers and fulcrums are made of the best cast steel, laid on blocks of granite, extending across the pit, the upper part of the scale only being made of wood. E. Ellicott has made the largest Railroad Scale in the world, its extreme length was one hundred and twenty feet, capable of weighing ten loaded cars at a single draft. It was put on the Mine Hill and Schuylkill Haven Railroad.

We are prepared to make scales of any size to weigh from five pounds to two hundred tons.

**ELLICOTT & ABBOTT.**  
Factory, 9th street, near Coates, cor. Melon st.  
Office, No. 3 North 5th street,  
1y25 Philadelphia, Pa.

J. EDGAR THOMSON,  
Ch. Eng. and Gen. Agent.  
Augusta, Sept. 2d, 1846. \*44 ly

**THE WESTERN AND ATLANTIC** Railroad.—This Road is now in operation to Oothcaloga, a distance of 80 miles, and connects daily (Sundays excepted) with the Georgia Railroad.

From Kingston, on this road, there is a tri-weekly line of stages, which leave on the arrival of the cars on Tuesday, Thursday and Saturday, for Warrenton, Huntsville, Decatur and Tusculumbia, Alabama, and Memphis, Tennessee.

On the same days, the stages leave Oothcaloga for Chattanooga, Jasper, Murfreesborough, Knoxville and Nashville, Tennessee.

This is the most expeditious route from the east to any of these places.

CHAS. F. M. GARNETT,  
Chief Engineer.  
Atlanta, Georgia, April 16th, 1846. 1y1

**PHILADELPHIA, WILMINGTON & BALTIMORE RAILROAD.—1847.**

Winter Arrangement.

Philadelphia for Baltimore... 8 a.m. and 4 p.m.  
Baltimore for Philadelphia... 9 a.m. and 8 p.m.

Connecting in Baltimore with Mail Lines south and west, as per notice of the Baltimore and Ohio Railroad—and with Mail Lines north from Philadelphia, both morning and afternoon.

Sundays, the Morning Lines do not run in either direction.

Accommodation train from Wilmington to Philadelphia, leaves Wilmington at 8 a.m., and returns at 3 p.m.

J. R. TRIMBLE,  
Engineer and General Superintendent. 2f

**LITTLE MIAMI RAILROAD.—OPEN TO SPRINGFIELD—Distance 84 miles—**

connecting at Xenia and Springfield with Messrs. Neil, Moore, & Co's. daily daylight lines of stages going east and north, to Columbus, Zanesville, Wheeling, Cleveland, and Sandusky City, via Urbana, Bellefontaine, Kenton, and the Mad river and lake Erie railroad, or Columbus, Delaware, and the Mansfield and Sandusky City railroad—forming, by these connections, the cheapest and most expeditious route to Buffalo, Niagara Falls, Rochester, Albany, New York, and Boston.

On and after Thursday, August 13, 1846, until further notice, a Passenger train will run as follows:

Leave Cincinnati daily at 9 A. M., for Milford, Foster's Crossing, Deerfield, Morrow, Fort Ancient, Freeport, Waynesville, Spring Valley, Xenia, Old Town, Yellow Springs, and Springfield.

Returning, will leave Springfield at 4 hours 35 minutes A. M. A line of Hacks runs in connection with the Cars, between Deerfield and Lebanon.

Fare—From Cincinnati to Lebanon... \$1 00  
" " " Xenia..... 1 50  
" " " Springfield... 2 00  
" " " Columbus... 4 00  
" " " Sandusky city 8 00

The Passenger trains runs in connection with Strader & Gorman's line of Mail Packets to Louisville.

Tickets can be procured at the Broadway Hotel, Dennison House, or at the Depot of the Company, on East Front street.

Further information and through tickets for the Stage lines, may be procured at P. Campbell, Agent on Front street, near Broadway.

The company will not be responsible for baggage beyond 50 dollars in value, unless the same is returned to the conductor or agent, and freight paid at of a passage for every \$500 in value over that amount.

The 1½ P. M. train from Cincinnati, and the 2 40 P. M. train from Xenia, will be discontinued on and after Monday, the 10th instant.

A freight train will run daily.  
47f W. H. CLEMENT, Sup't.

**SOUTH CAROLINA RAILROAD.—A** Passenger Train runs daily from Charleston,

on the arrival of the boats from Wilmington, N. C., in connection with trains on the Georgia, and Western and Atlantic Railroads—and by stage lines and steamers connects with the Montgomery and West Point, and the Tusculumbia Railroad in N. Alabama.

Fare through from Charleston to Montgomery daily.....\$6 50

Fare through from Charleston to Huntsville, Decatur and Tusculumbia..... 23 00

The South Carolina Railroad Co. engage to receive merchandize consigned to their order, and to forward the same to any point on their road; and to the different stations on the Georgia and Western and Atlantic railroad; and to Montgomery, Ala., by the West Point and Montgomery Railroad.

1y25 JOHN KING, Jr. Agent.

**LAWRENCE'S ROSENDALE HYDRAULIC** Cement. This cement is warranted equal to any manufactured in this country, and has been pronounced superior to Francis' "Roman." Its value for Aqueducts, Locks, Bridges, Floods and all Masonry exposed to dampness, is well known, as it sets immediately under water, and increases in solidity for years.

For sale in lots to suit purchasers, in tight papered barrels, by JOHN W. LAWRENCE,

142 Front street, New York.

Orders for the above will be received and promptly attended to at this office. 32 ly

**SPRING STEEL FOR LOCOMOTIVES,** Tenders and Cars. The Subscriber is engaged in manufacturing Spring Steel from 1½ to 6 inches in width, and of any thickness required: large quantities are yearly furnished for railroad purposes, and wherever used, its quality has been approved of.

The establishment being large, can execute orders with great promptitude, at reasonable prices, and the quality warranted. Address

JOAN F. WINSLOW, Agent,  
Albany Iron and Nail Works, 1y

# NORRIS' LOCOMOTIVE WORKS.

BUSH HILL, PHILADELPHIA, Pennsylvania.

**M**ANUFACTURE their Patent 6 Wheel Combined and 8 Wheel Locomotives of the following descriptions, viz:

Class	1,	15 inches Diameter of Cylinder,	× 20 inches Stroke.
"	2,	14	" " " × 24 " "
"	3,	14½	" " " × 20 " "
"	4,	12½	" " " × 20 " "
"	5,	11½	" " " × 20 " "
"	6,	10½	" " " × 18 " "

With Wheels of any dimensions, with their Patent Arrangement for Variable Expansion.

Castings of all kinds made to order: and they call attention to their Chilled Wheels, for the Trucks of Locomotives, Tenders and Cars.

NORRIS, BROTHERS.

**K**EARNEY FRIE BRICK, F. W. BRINLEY, Manufacturer, Perth Amboy, N. J. Guaranteed equal to any, either domestic or foreign. Any shape or size made to order. Terms, 4 mos. from delivery of brick on board. Refer to

25,000 to 30,000 made weekly. 36

**T**HE NEWCASTLE MANUFACTURING Company continue to furnish at the Works, situated in the town of Newcastle, Del., Locomotive and other steam engines, Jack screws, Wrought iron work and Brass and Iron castings, of all kinds connected with Steamboats, Railroads, etc.; Mill Gearing of every description; Cast wheels (chilled) of any pattern and size, with Axles fitted, also with wrought tires, Springs, Boxes and bolts for Cars; Driving and other wheels for Locomotives.

The works being on an extensive scale, all orders will be executed with promptness and despatch. Communications addressed to Mr. William H. Dobbs, Superintendent, will meet with immediate attention. **ANDREW C. GRAY,** 245 President of the Newcastle Manuf. Co.

**R**AILROAD IRON AND LOCOMOTIVE Tyres imported to order and constantly on hand by **A. & G. RALSTON** 4 South Front St., Philadelphia. Mar. 20th

**V**ALUABLE PROPERTY ON THE MILL Dam For Sale. A lot of land on Gravelly Point, so called, on the Mill Dam, in Roxbury, fronting on and east of Parker street, containing 68,497 square feet, with the following buildings thereon standing.

Main brick building, 120 feet long, by 46 ft wide, two stories high. A machine shop, 47x43 feet, with large engine, face, screw, and other lathes, suitable to do any kind of work.

Pattern shop, 35x32 ft. with lathes, work benches, Work shop, 86x35 feet, on the same floor with the pattern shop.

Forge shop, 118 feet long by 44 feet wide on the ground floor, with two large water wheels, each 16 feet long, 9 ft diameter, with all the gearing, shafts, trums, pulleys, &c., large and small trip hammers, turnaces, forges, rolling mill, with large balance wheel and a large blowing apparatus for the foundry.

Foundry, at end of main brick building, 60x45½ feet two stories high, with a shed part 45½x20 feet, containing a large air furnace, cupola, crane and corn oven.

Store house—a range of buildings for storage, etc., 300 feet long by 20 wide.

Locomotive shop, adjoining main building, fronting on Parker street, 54x25 feet.

Also—A lot of land on the canal, west side of Parker st., containing 6000 feet, with the following buildings thereon standing:

Boiler house 50 feet long by 30 feet wide, two stories.

Blacksmith shop, 49 feet long by 20 feet wide.

For terms, apply to **HENRY ANDREWS, 48 State st.,** or to **CURTIS, LEAVENS & CO., 106 State st., Boston,** or to **A. & G. RALSTON & Co., Philadelphia.** ja45

**T**O RAILROAD COMPANIES AND BUILDERS OF MARINE AND LOCOMOTIVE ENGINES AND BOILERS.

PASCAL IRON WORKS.

**WELDED WROUGHT IRON TUBES**

From 4 inches to 1 in calibre and 2 to 13 feet long, capable of sustaining pressure from 400 to 2500 lbs. per square inch, with Stop Cocks, T, L, and other fixtures to suit, fitting together, with screw joints, suitable for STEAM, WATER, GAS, and for LOCOMOTIVE and other STEAM BOILER FLUES.

Manufactured and for sale by **MORRIS, TASKER & MORRIS.** Warehouse S. E. Corner of Third & Walnut Streets, PHILADELPHIA.

**T**O LOCOMOTIVE AND MARINE ENGINE Boiler Builders. Pascal Iron Works, Philadelphia. Welded Wrought Iron Flues, suitable for Locomotives, Marine and other Steam Engine Boilers, from 2 to 5 inches in diameter. Also, Pipes for Gas, Steam and other purposes; extra strong Tube for Hydraulic Presses; Hollow Pistons for Pumps of Steam Engines, etc. Manufactured and for sale by

**MORRIS TASKER & MORRIS,** Warehouse S. E. corner 3d and Walnut Sts., Philadelphia. 11f

**P**ATENT INDESTRUCTIBLE WATER Pipes. The subscribers continue to manufacture the above Pipes, of all the sizes and strength required for City or Country use, and would invite individuals or companies to examine its merits.—This pipe, unlike cast iron and lead, imparts neither color, oxide or taste, being formed of strongly riveted sheet iron, and evenly lined on the inside with hydraulic cement. While in the process of laying, it has a thick covering externally of the same—thus forming nature's own conduit of stone. The iron being thoroughly enclosed on both sides with cement, precludes the possibility of rust or decay, and renders the pipe truly indestructible. The prices are less than those of iron or lead. We also manufacture Basins and D. Traps, for Water Closets, on a new principle, which we wish the public to examine at 112 Fulton street, New York.

**J. BALL & CO.**

**Kennebec Railroad.**

The following article on the merits of the Androscoggin and Kennebec railroad, appeared in a late number of the Boston Daily Advertiser:

"I saw some days since an article in your paper respecting the construction of the Portland and Kennebec railroad extending from Portland up the Kennebec river to Augusta. It is well understood by some in Boston, doubtless, that there are two railroads penetrating the interior of Maine now talked of; the one above alluded to, and the Androscoggin and Kennebec railroad, extending from Danville near Lewiston, and thence through the interior of Waterville, 18 miles above Augusta on the Kennebec river. The former, with the branch to Bath, is 67 miles long, and the latter 50 miles in length. The projectors of the latter also intend to form a junction with the Atlantic and St. Lawrence road at Danville, and by some arrangement with the directors of that road, to run over it to Portland and there to connect with some road, and thence to Boston. The question will naturally arise, in which of these roads is Boston enterprize and Boston capital most interested to see constructed? Maine has been and is now one of our best customers, and what our merchants, and mechanics, and manufacturers desire, is to see new resources developed and additional capacities to exchange commodities and to purchase created: now this road from Portland upon the banks or near the Kennebec river, will give no spring to business in the interior of Maine. It will exert comparatively no influence as a means of transportation and communication any farther back from the river, than the river itself has; except the winter season.—The farmer in the interior will have no additional advantages for disposing of surplus products, and consequently no additional inducements for raising any. Nor will it tend at all to bring into use the splendid water power which the interior of Maine possesses. All the surplus products and commodities, within such distance from the river as will warrant the owner to haul them, now find their way to the river towns, and thence to Boston or elsewhere, and it is not perceived how this railroad to Augusta will tend to augment the amount. On the contrary, the road from Lewiston to Waterville, runs thro' and near to the very garden of that State.—The inhabitants of the counties of Somerset and Franklin, and the northern and western portion of the county of Kennebec, have long suffered for want of facilities to transport to a market the products of the country. The trader in many parts of that section of the State for want of those facilities which a railroad would give, cannot afford to take in exchange or purchase at remunerating prices the products of the farm, and hence there is no inducement to the farmer to raise a surplus. This railroad pursuing its course from Lewiston to Waterville, a distance from 12 to 18 miles from the river until it reaches Waterville, is destined, if constructed, to infuse new vigor into every department of industry in the region through which it goes. There is no reason except the want of facilities for trans-

portation, why Winthrop, Redfield, Farmington, and Waterville, should not do as profitable and extensive business in trade as Gardiner, Hallowell, and Augusta. They are surrounded by a dense population, and in the midst of a territory incomparably more fertile and productive. It is this road then which the business men of Boston should look to as opening to them new capacities to purchase, and increased ability to become consumers. Nor let it be said that all the benefits, resulting from opening this road through this thickly settled and fertile region, will inure to Portland. The people of that section of that State, as well as of the other portions of it, look to Boston as the centre of trade, and will continue so to do so long as Boston can hold out superior inducements. It is known to your correspondent that liberal arrangements have already been made with the Atlantic and St. Lawrence road, whereby freight and passengers shall go from their road upon some road leading to Boston with the same facilities and ease as they will go from any other road coming to Portland from the interior of Maine. Such being the case, Boston and Portland are left, so far as these railroads are concerned, fairly to compete with each other in securing to themselves the products of the interior of Maine. And this is right, and all that the merchants of either city should expect. Both will doubtless be greatly benefited by its being opened, and the people in the interior more so for having the advantage of both markets. If our views of the effect of these two roads upon the growth, enterprize and productive energies of Maine are correct, most manifest is it that Boston merchants and Boston enterprize has infinitely more to hope from the construction of the interior road through Maine than from that along the river. At an early day the inquiry in which road is Boston capital most interested, will be considered.

**Railroads on the Continent of Europe.**

The same article in the Edinburgh Review from which we have gleaned some interesting statistics relative to English railroads, contains others relating to those on the continent of Europe. We condense them, hoping that they may not be found uninteresting or useless.

The little kingdom of Belgium was the first that followed the example of England, and turned its attention to the construction of railroads. This it did, in order that its commerce might not suffer from the effects of the revolution of 1830, which, by sundering the union of Belgium and Holland, cut off the former from the use of the mouths of the Scheldt. Four great lines were built. The first, or eastern line, running from Malines to Cologne, by Louvaine, Tullemont, Laudon, Waremmé, Liege, and Verviers, with a branch to St. Trond, is 91 miles in length. The western line, from Malines to the sea on the north, by the Termond, Ghent, Bruges and Ostend, with a branch from Ghent to the French frontier by Menin and Courtrai, is 126 miles in length. The northern line, from Malines to Antwerp, with a branch to Lievre, is 16 miles long; and the southern, to the French frontier, by Brussels and Mons,

with a branch to Charleroi and Namur, is 115 miles long. The whole number of miles is 348. The first road was opened in 1837, and was quickly followed by that of the others. The effect on travel on some portions of these lines, was astounding. Between Brussels and Antwerp, the number of passengers increased from 75,000 per annum, to one million! The cost of the Belgian roads, has been about \$50,000 per mile. Low fares and low rates for transportation of merchandize exist; as the roads were intended by government, not as sources of profit, but for the accommodation of the whole public. Four per cent. is cleared, which is all that is desired, as it equals the interest of the capital sunk. The facts in the history of these roads, agree with those derived from that of the British roads, in respect to short travel, etc. The arrangements for the conveyance of all kinds of merchandize, at the lowest possible rates, are most admirable, and the consequence is seen in the enormous increase of traffic. "In 1841, before they were matured," says our authority, "the total receipts for merchandize were £19,000. In 1841, its amount was £177,800! Before the establishment of the eastern branch of the railway, the highest amount of heavy goods sent to the German frontier, by the old conveyance, was 12,000 tons; in 1844, the amount transported was 67,500 tons! In 1842, before the railway took the traffic, the amount of light goods was 194,000 tons; in 1844, it exceeded 500,000 tons!" Well may the reviewer say, that considered relatively to the population and territory of Belgium, this is the greatest work of public utility which any European state has executed in our times. To afford to inferior places a direct participation in the benefits of the system, private companies, under the authority of the state, have undertaken the construction of about 200 miles of railroad, the lines thus made to communicate between those towns and the great lines.

France has at length waked up from that unaccountable stupidity on the subject of railroads, in which she, the first of scientific countries, so long indulged. A few small lines were built to 1842, in which year the government came to the conclusion to plan and execute a system of railroads. "It was determined, that from Paris, as a centre, main branch lines should issue, to be directed to those points of the frontier, by land and sea, that should best serve the purposes of foreign commerce; and that the demands of the interior should be consulted in the routes which these lines should follow in passing through it, and in the various ramifications which they should throw off." Six lines were planned. The first goes northward to Belgium, with the roads of which country it will unite near Lille and Valenciennes, having branches to Amiens and Lille, and communicating with the British Channel at Dunkirk, Boulogne, and Calais—"thus opening a rapid and easy communication with England, and affording a means of travel with the fifth commercial port, and the great granary of the northern section of the kingdom." The

second line goes from Paris southward, by the way of Orleans, Tours, Poitiers, Angoulême, and Bordeaux, having its southern terminus at Bayonne, its object being to aid the trade with Spain. From this road, branches are thrown off to Nantes and Vierzoon. The third line takes an eastern course, through Champagne and Lorraine, to Strasbourg and Bale, and having a branch to Metz. It will unite with the German railroads. The fourth proceeds from Paris to Brest, through Rennes, and is to strike the Atlantic shore in that quarter. Another line is to run south, and strike the base of the Pyrenees, opening a route to the centre of Spain, via Saragossa. The sixth line goes to Rouen, and has branches to Dieppe and Havre.—Two other lines have been projected, "proceeding from Marseilles, one leading to the Atlantic at Bordeaux, and the other communicating by Lyons with Switzerland, Alsace, and northern Germany; and running into the eastern line from Paris, at Dijon." The entire length of these roads and their branches will be 3335; and judging from the cost of what had been completed at the close of 1844, the entire cost would be not quite \$100,000 per mile, or for the whole about \$330,000,000. About 1000 miles were completed at the end of last year. The undertaking is governmental, and the system is made with reference to the comfort, convenience and economy of the people. Fares are low, and the third class cars are, in all respects, better in France, than the second class are in England. "They order these things better in France," can be said now, though in reference to widely different matters, quite as correctly as in the days of Stern. Until the whole undertaking is completed, it cannot be possible to say what will be the profits on a railway investment in France on a large scale; but thus far it has averaged, in these lines, 4½ per cent. Short travel is the most productive.

Austria has entered upon railroad construction with a zeal we had hardly expected in a state so wedded to old uses and abuses, and so averse to every kind of improvement. From Vienna run four great lines; one to the south, through Gratz and Laybach, to Trieste; one to the north, via Prague, to the line of Saxony, having "a branch to form a union by Olmutz with the great line through Prussian Silesia;" one to the east, connecting Hungary with the capital, running by Pseth and Debreczin; and the fourth to Munich, the capital of Bavaria, by Lintz. "By these," says the reviewer, "a profitable communication will be opened with those rich and hitherto inaccessible tracts of eastern Europe intersected by the valley of the Danube—possessing vast pasturages, regions fertile in wheat, maize, and rice, flourishing plantations of hemp and tobacco, and extensive vineyards." Austria has other roads in view, the construction of which will unite the northern seas with the Adriatic. In her Italian possessions, Austria has under way a railroad about 200 miles long, connecting Milan with Venice. From the latter city, there is excellent steam navigation to Trieste,

where terminates the great northern and southern road. When completed, these roads will number 1935 miles. Prussia has not been behind Austria in this species of noble enterprize. She has projected railroads amounting to 1063 miles, the greater part of which has been completed. Lines run from Berlin, striking Cologne, on the Rhine, and Frankfort-on-the-Main, the first connecting with the Belgian roads, and the second with those of France. Another line takes an eastern direction, going towards Russia, by the way of Frankfort-on-the-Oder, Posen, Dantzic, and Kenigsberg. One goes to Hamburg, from Berlin, another to Stettin, and a third to Silesia, in which province it will communicate with the Austrian northern line, and make the connection between the Mediterranean and the Baltic and the northern waters generally, a somewhat more easy matter than it was in the most glorious days of the Hanseatic League. Some other lines are under contemplation, among which are one direct from Berlin to Dresden, and another from Lippstadt to Cassel. The east or the Prussian lines, so far as ascertained, has been about \$43,000 per mile; average dividends, 5½ per cent. Bavaria has under way three great lines, one connecting the Prusso-Saxon line at Hof with Lindau, on the Lake of Constance, by the way of Augsburg, Donauwörth, Nuremberg, and Bamberg. The second line runs east and west, connecting with the Austrian roads on one side, and with those of Wirtemberg and Baden on the other. The third runs from Bamberg to Frankfort-on-the-Main, where it connects with several lines which centre at that point. Besides these great undertakings of the leading Germanic powers, the minor states of that country have done much for the same purpose—Saxony, Hesse, Hanover, Brunswick, Mecklenburg, and the Hanse House, have planned about 1700 miles in all, several hundred of which are already in working order. These latter roads are all well culminated to increase the usefulness of the lines of Austria, Russia, and Bavaria; and it may be remarked, that although these several enterprises have been undertaken by different nations, yet, "partly from the physical character of the countries, and partly from the distribution of the population and seats of industry, and a consequent harmony of interests, they have of themselves assumed a considerable uniformity of plan; and the Germanic states will, ere long, be overspread by one of the most magnificent systems of interior communication of which Europe can afford an example." It would afford us much pleasure to go more into detail on this great system, so creditable to the German people and governments, showing its effects on commerce, travel, etc., but our limits forbid. The whole number of miles, built, under way, or planned, is 7600, England, the cost of which will be not far from \$330,000,000, averaging about \$45,000,000 per mile. The effect on the price of labor has been excellent, causing its rise about 33 per cent. Eight millions of laborers were employed on the roads in 1844.

Russia has under way, one railroad from

St. Petersburg to Cracow, via Warsaw, which is to unite with the German lines. A second connects St. Petersburg with Moscow; the third will commence at the terminus of the Austrian railroad in Hungary, and proceed to Odessa, the great emporium of Southern Russia, and the chief port on the Black Sea. A merchandize line is to connect the rivers Dunna and Volga. These roads will be in length 1600 miles. The Edinburg says nothing of the continuation of the great Russian road from St. Petersburg to Moscow; but we have seen it stated by other authorities, that it is the intention of the Russian government to continue that road from Moscow to Astrachan, on the Caspian Sea—an idea almost worthy to compare with that of opening a road from the Western Lakes to the Pacific.

In Holland, a railroad has been made from Amsterdam to Rotterdam, 53 miles, intended to be a double track. A road has been constructed from Amsterdam to the Prussian frontier, and opened to Arnheim, 58 miles. The first road cost less than \$25,000 per mile; the second about \$70,000. Other lines are to be constructed on quite a large scale, by private companies, but under the superintendence of government.

In the Italian States, Spain, Portugal, Sweden, etc., nothing, or next to nothing, has yet been done in the way of constructing railroads, though it is probable that all of them will soon become alive to the necessity of entering upon the work. The liberal and enterprising character of the new Roman pontiff is favorable to the prospects of Italy; and perhaps, ere many years have elapsed, pilgrims to the eternal city, may course at the rate of 20 or 30 miles an hour over the Flaminian and Appian ways.

From the Pittsburg Gazette.  
The Great Central Railroad from Philadelphia to St. Louis.

The object of my lectures was to present to the people of Pittsburg a plan for the extension of the Central railroad in a direct line to St. Louis, through the States of Ohio, Indiana and Illinois, thereby securing the trade of the west, which naturally ought to flow through Pennsylvania, but is now diverted to the Lakes and New York. After reviewing the merits of the leading routes proposed or in operation, from the seaboard to the west, we arrive at the conclusion that the Pennsylvania route is the best, for travel as well as freight. But it is considered necessary that the whole line from Philadelphia to St. Louis, which will not exceed 1000 miles in length, should form a continuous railroad without any transshipment. This line is to be built in the most substantial manner, and calculated for an annual business of 300,000 through passengers, and 250,000 tons of goods. The idea is, to form a grand trunk line of 1000 miles long, capable of accommodating the whole of the States west of Pittsburg. This trunk line will intersect all the improvements which traverse the western States in a north and south direction, connecting the lakes with the Ohio river. In place of establishing independent lines from here to Cleveland, Canton, or Co-

lumbus, one single central line is proposed, which, from its directness, good construction and management, will offer such great facilities of conveyance, that the different sections of the west, on both sides of this great thoroughfare, will find it their interest to form numerous lateral or branch roads. By the construction of a direct road to St. Louis, we will therefore lay the foundation for an immense system of railroad, all directed to Pittsburgh. Has a more magnificent scene ever been presented to our citizens? Is there any question before the public now which is of greater importance than the contemplated railroad connection with the east and west?

The whole success of this enterprize will depend upon the good sense of the people of Pittsburgh. Let us act as rational men, and divest ourselves of all feeling and prejudicial impressions. It is not only for ourselves who are interested in this matter; we only form the connecting link between the east and west. Our true interest is, to place ourselves in the best position towards both; it is impossible, and would be impolitic, to maintain a solitary stand. St. Louis, Cincinnati and the whole west, are directing their efforts towards New York, not by way of Pittsburgh, but by the lakes. The west feels the want of a continuous railroad to the seaboard.—The nearest, best, and cheapest route to Philadelphia, as well as New York, will be offered by the great Central railroad, passing through Pittsburgh, not stopping here, but only passing through. We must remember, that the great market for the west is in the east; we should remember, therefore, carefully to avoid throwing any obstacles in the way of this commerce. For this reason, there should be no transshipment from St. Louis to Philadelphia. The more facilities we offer, the greater will be the travel through our city. Whatever can be manufactured and purchased here, as cheap as in the east, will of course be ordered here. The western merchant will travel no further than necessary.

By establishing a road from here west, independent of the Pennsylvania road, we should injure the whole route, ourselves as well as the east and west: we should thereby give an undue advantage to the New York as well as the Virginia route.

On mature reflection, it will appear that on this question our interests are identical with those of the east and west.

As the travel on the great Central road will be very great, it is necessary to construct it substantially; a cheap and poorly constructed road will not attract much business, travellers will shun it, and keep out of its way. Moving at the rate of 25 to 30 miles per hour, requires a good track, and machinery.

The true interest of Pittsburgh is, to aid in the construction of a great road from the east to the far west, and to render this road capable of transporting cheaper and quicker than any other road. But this cannot be accomplished by dividing the business of the west between Philadelphia and Baltimore. To succeed with a good road, and to be enabled to transport at a low rate, we must do a heavy business—this is an established prin-

ciple in railroading. For the next quarter of a century, we will not have business enough to support two roads; the time, however, will come when the stock of the Connellsville railroad will be good, and this road will be wanted. The construction of that road at the present period, however, would be a highly injurious movement. Philadelphia will and must come here, there is no other way left for that city. We will bid them welcome! If the Baltimoreans insist upon coming here at their own expense, let them come, we shall not object. But we have no spare resources to aid them now. Our primary object is, and must be, to apply all our means and resources towards an early construction of the Central road west.

The shortest route to St. Louis, appears to be by way of Columbus and Indiana. The question as to the best route must, however, remain open, until decided by extensive surveys, under the charge of competent engineers.

Philadelphia will employ herself in perfecting the surveys here during this season. Let Pittsburgh and St. Louis join hands and commence the western surveys. No application need be made for charters, until the main direction of the route is determined on. Or, if charters are granted, they must allow sufficient latitude for the choice of routes.

It is important that negotiations between Pittsburgh and St. Louis should be opened at an early day, so that the great route may be decided on within the present year. This great improvement will, I have no doubt, influence the location of numerous railroads which have been projected throughout the western States; and it rests with us, to project and carry out one grand and uniform system, in place of running wild, in all directions, and without any good object in view.

JOHN A. ROEBLING.

#### Western Magnetic Telegraph.

The following letter in relation to the Southwestern Telegraph, appears in a late number of the Cincinnati Gazette, from E. CASE, Esq., which will explain the numerous stories which have been going the rounds of the press, for the last few weeks. Mr. Case says:—

Various rumors being in circulation respecting the formation of a company, or of companies, to connect this city with Washington, Baltimore, Philadelphia, New York, Boston, etc., via Wheeling and Pittsburgh, and with New Orleans and St. Louis, via Louisville, the position of the undersigned renders it proper for him to state such facts in regard to the extension of the telegraph line as are of immediate interest to the people of the Mississippi Valley.

He has obtained a legal transfer from the patentees of their right to construct a line or lines of magnetic telegraph, connecting the cities of Washington, Baltimore, and Philadelphia westward with Harrisburg, Pittsburgh, Cumberland, Wheeling, via Columbus to Cincinnati, Louisville, Nashville, etc., to N. Orleans, and from Louisville to St. Louis, and from Columbus to Cleveland.

He is authorized to form a company (and will proceed to do immediately) to be known

as "The Western Telegraph Company," for the purpose of raising the necessary funds to connect the above-named places, and all intermediate points of sufficient importance to require an office. The cost of construction, including batteries, and all things necessary for working Morse's Electro Magnetic Telegraph, is not to exceed \$125 per mile for one wire, and \$35 per mile for each additional wire. The whole distance will fall short of two thousand miles, and consequently the entire cost will be less than \$250,000—a very small sum for such an important work.

A line of telegraph is already built and in operation from Philadelphia to Pittsburg, and provision is made in my articles of agreement with the patentees to allow the stockholders, by subscribing their names to the agreement of the Western Telegraph company to become stockholders in it, upon the same terms and conditions of original subscribers. The patentees contend (and I have no doubt correctly) that the line from Pittsburgh to Philadelphia has been built in violation of their rights, and without their authority; and hence it will be treated by them, and those acting under their legal authority, as spurious, unless the stockholders become absorbed in the Western Telegraph company, and till they do become so absorbed.

My agreement with the patentees stipulates for the completion of the contemplated work within two years from the 1st of January, 1847; but if no unforeseen obstacles should present themselves, it is my intention to have it done at a much earlier day.

As soon as a proper organization is made, persons, duly authorized to act, will visit the different cities and towns upon the proposed lines, to solicit their friendly co-operation in raising a share of the necessary funds. Pittsburgh, New Orleans and St. Louis being three of the most important points, and most deeply interested, will not, it is presumed, be a whit behind Cincinnati in the substantial promotion of this great work.

The interruptions on the eastern lines will be avoided on this line, by using iron wire instead of copper, and of three times the size, and nine times the strength, and by using great care in the insulation.

In fact, the frail copper wire used upon the eastern lines when first constructed, is now being replaced by a substantial iron cord, or wire of sufficient strength to resist the storms, and especially the ice, that have heretofore broken it to pieces, and interrupted communication.

The productiveness of capital invested in important lines of telegraph, and their great public utility, are now no longer debatable questions; and it will be but a brief period before communications will pass with the speed of lightning over and through the whole extent of our vast territory, from north to south, from east to west, cementing more and more strongly the bonds of union, and holding aloft, with firmer nerves and stronger grip, the star spangled banner, the glory of American freemen, and the admiration of millions throughout the world.

ELIHALET CASE, JR.

## New York Railroad Statistics.

As we have not yet received the Comptroller's report, we are indebted to the *Albany Evening Journal* for the following synopsis of the railroad statistics of New York State, for the last year.

## MOHAWK AND HUDSON RAILROAD.

Length of road in operation, 16 miles and 4837 ft.  
Cost of construction ..... \$1,461,152 91  
Paid for rebuilding 2 engines and 34 freight cars ..... 11,814 04

\$1,472,966 95

Interest which accrued in  
1846 ..... \$25,019 69  
Do. do. in 1845.. 3,094 02

\$28,113 71

Repairing and operating the road in 1846,  
\$41,776 84

Income from 174,653 passengers ..... \$92,191 67  
" " Local and western freight. 18,321 59  
" " Mail contract ..... 1,950 09  
" " Rents ..... 1,390 82

\$113,857 08

Rec'd from the sale of houses,  
land and materials ..... \$8,978 64  
Received from bonds of 1845. 3,000 00

\$11,978 64

Number of locomotives 6.

## UTICA AND SCHENECTADY RAILROAD.

Length of road 78 miles. Cost of construction  
\$2,189,505 10

Income from passengers ..... \$347,535 51  
" " Freight ..... 65,296 57  
" " United States mail ..... 5,850 00  
" " Other sources ..... 9,713 90

\$428,395 98

Expenses of running the road ..... \$167,820 82  
" for engines, constructing and  
grading ..... 75,609 70  
Amount of dividends ..... 160,000 00

Total expenses and dividends ..... \$403,430 52  
Number of locomotive engines 15.

## SYRACUSE AND UTICA RAILROAD.

Length of road 53 miles.  
Cost of construction ..... \$1,128,940 24  
" " less depreciated prop'ty. 30,000 00

\$1,098,940 24

Receipts from 103,798½ thro' pass'gers. 207,597 00  
" " 51,481 way passengers. 22,111 56  
" " transportation of freight. 19,623 50  
" " transportation U. S. M. 6,289 75  
" " miscel. sources ..... 2,015 41

\$357,637 22

Expenses for repairing, operating and  
running the road, including amount  
paid for debt and new cars ..... 124,932 48  
Amount paid for new trench ..... 38,241 12  
do. do. permanent fixtures ..... 8,017 56

\$171,191 19

Expenses on account of construction for  
land ..... 12,112 73  
Dividends paid February 15 ..... 40,000 00  
Dividends paid August 15 ..... 40,000 00  
Number of locomotives 9.

## AUBURN AND SYRACUSE RAILROAD.

Length of road 26 miles.  
Cost of construction ..... \$676,239 02  
Expended in construction in 1846 ..... 3,947 50  
Interest ..... 105,037 38

\$784,223 90

Income from 105,889½ passengers ..... 98,051 71  
do. do. freight ..... 16,886 32  
do. do. United States mail ..... 4,050 00  
do. do. Incidental ..... 50 00

\$119,038 93

Expense of repairing and running the  
road ..... 46,164 08  
Amount of dividends ..... 32,000 00

## AUBURN AND ROCHESTER RAILROAD.

Length of road, 78 miles.  
Cost of construction to Jan. 1846 ..... \$1,832,045 18  
Cost of expenditures in 1840 ..... 32,999 28

\$1,865,044 46

Receipts from 62,218 thro' pass'gers... 169,006 98  
Receipts from 80,037 way ..... 84,066 23  
Receipts from freight ..... 20,201 76  
Receipts from U. S. mail and other  
sources ..... 16,895 58

\$290,170 55

Expenses for repairs and running the  
road ..... 110,352 24  
Dividends paid 1st February, 1846... \$56,000 00  
Dividends paid 1st August, 1846 ..... 56,000 00

Amount of dividends paid ..... \$112,000 00

## TONAWANDA RAILROAD.

Length of road, 43½ miles.  
Cost of construction ..... 754,063 28  
Expended in " 1846 ..... 2,507 91

\$753,555 19

Receipts from 92,387½ passengers ..... 111,583 09  
do. do. freight ..... 23,779 97  
do. do. U. S. mail ..... 6,347 25  
do. do. storage ..... 2,107 89

\$143,818 20

Receipts from sinking fund and N. York  
Life Insurance and Trust co. .... 5,333 33  
Receipts from the sale of iron, etc. .... 3,161 65  
do. do. cars sold ..... 300 00  
do. do. interest received ..... 447 91

\$9,242 80

Expense of construction, repairs and run-  
ning the road ..... 89,534 44

## ATTICA AND BUFFALO RAILROAD.

Length of road, 31 miles 26 chains.  
Length of branch road about 80 chains.  
Cost of construction ..... \$306,704 52  
Cost of engine and cars ..... 46,104 33

\$354,808 85

Receipts from 87,633 ..... 72,405 55  
do. do. freight ..... 8,185 64  
do. do. U. S. mail ..... 4,800 00  
do. do. sale of stock ..... 877 50  
do. do. various sources ..... 225 37

\$86,494 06

Expense of construction in 1846 ..... 3,446 63  
do. engines and cars ..... 9,711 80  
do. running the road ..... 33,564 98

\$46,723 41

Dividends, February 1, 1846 ..... 13,546 00  
Dividends, August 1, 1846 ..... 16,950 00

Amount of dividends ..... \$30,496 00

## SCHENECTADY AND TROY RAILROAD.

Length of road, 20½ miles.  
Cost of construction to 1st Jan. 1846... \$641,540 02  
Expended for do. in 1846 ..... 2,007 54

\$643,547 56

Receipts for 57,793 thro' passengers... 27,997 96  
do. do. 4,996 way passengers ..... 1,499 19  
do. do. freight ..... 6,720 88  
do. do. mail and other sources ..... 570 00

\$36,788 03

Expenses of running the road ..... 31,545 30  
No dividends

## ALBANY AND WEST STOCKBRIDGE RAILROAD.

Length of road in operation, 38½ miles.  
Cost of construction ..... \$1,777,019 57

Number of thro' passengers ..... 76,412  
do. way passengers ..... 27,914½  
Expense of road, including ferry boat  
and dock in the city of Albany, paid  
by lessees ..... \$17,500 62

There is no income. The lessees pay the inter-  
est on the bonds of the city of Albany, which am't  
to \$1,000, as rent.

## RENSSELAER AND SARATOGA RAILROAD.

Length of road, 25 miles.  
Cost of construction ..... \$475,801 10  
Receipts from 18,477 thro' passengers... 18,856 63  
do. from 33,930 way passengers... 13,510 03  
do. from freight ..... 8,183 61  
do. from U. S. mail ..... 524 55  
do. from bridge toll ..... 9,210 54  
do. from other sources ..... 243 40

\$50,534 07

Expenses for repairing and running the  
road ..... 38,639 48  
Expenses toll bridge ..... 2,829 75  
do. dividends ..... 9,000 00

\$50,469 23

Number of locomotive engines, 2

## CAYUGA AND SUSQUEHANNA RAILROAD.

Rec'ts of passengers and transportation... \$17,157 99  
Expenses of running the road ..... 6,801 44  
do. repairs on road ..... 5,569 54  
do. repairs of cars, etc. .... 2,193 58

\$14,557 56

## SARATOGA AND SCHENECTADY RAILROAD.

Length of road, 23 miles  
Cost of construction ..... \$300,000 00  
Receipts from 17,150 through pass'gers... 18,699 99  
do. from 18,827 way passengers ..... 8,750 01  
do. from freight ..... 4,668 74

\$33,118 74

Expenses of repairing and running the  
road ..... 26,358 41  
Dividends in January, 1846 ..... 9,000 00  
do. in December, 1846 ..... 9,000 00

\$44,358 41

## NEW YORK AND ERIE RAILROAD.

The receipts of the company from all  
sources ..... \$1,160,734 68  
Expenses of construction, repairs and  
running the road for the past year.. 917,635 51

Balance unexpended on the 1st Jan... \$343,099 17

## TABULAR STATEMENT.

Number of miles in operation, 62.  
Cost of construction (53 miles including  
pier) ..... 2,084,408 25  
Expended on 9 miles previous to 1846: 183,997 39  
Expended on construction in 1846 ..... 292,689 60

2,567,018 55

Expended for repairing and running the  
road and ferry expenses ..... 193,173 97  
Receipts from through passengers ..... 19,637 87  
do. from way passengers ..... 45,116 86  
do. from freight and U. S. mail.. 190,761 75

\$185,516 48

Number of locomotives 9.

## Fairly Begun.

It is with more than ordinary satisfaction that we  
announce to our readers to-day, that the subscription  
of the City of Philadelphia to the CENTRAL RAIL-  
ROAD is completed—more than the required three  
millions of stock having been taken in this city  
alone, exclusive of aid from the interior. The first  
instalment on this subscription was on Tuesday  
last paid in, says the *Pennsylvanian*, and certified  
by the commissioners. This gratifying fact "indi-  
cates not only a united public opinion on this sub-  
ject, in this city, and a generous disposition to urge  
forward the great work alluded to; but it proves  
also that the success of the Central railroad is placed  
beyond all doubt."

*Cornish Steam Engines.*—The number of pumping  
engines reported for the month of Dec. is 24—the  
quantity of coals consumed being 1471 tons, lifting,  
in the aggregate, 14,000,000 tons of water, 10 fath-  
oms high—the average duty of the whole is, there-  
fore, 53,000,000 lbs. lifted one foot high by the con-  
sumption of a bushel of coal.

Correspondents will oblige us by sending in their communications by Tuesday morning at latest.

### AMERICAN RAILROAD JOURNAL.

Published by D. K. MINOR, 105 Chestnut St., Philadelphia.

Saturday, February 27, 1847.

#### Mr. Roebing's Lectures.

In our last number we commenced the publication of *Mr. Roebing's Lectures*, originally written for the *Railroad Journal*—and delivered before the "Board of Trade" at Pittsburg—a short time since. We continue the article to-day—and in our next shall conclude the subject.

It needs no particular notice from us, for the name of the writer is sufficient commendation for its earnest perusal; yet we cannot allow this opportunity to pass, without remarking that the views of Mr. Roebing, in relation to this great iron chain of intercommunication between Philadelphia and St. Louis, meet our heartiest approbation—and we shall indeed be happy to know that men of means may be found (as we believe they will be, most readily,) who will step forward and further this important and promising undertaking.

The "Lectures" are written in a terse and excellent style, and the argument is convincing. We would merely add, that we feel under obligations to the able author for his communication—and we commend the article to the attentive consideration of the readers of the Journal, and especially to those residing in Philadelphia, Pittsburg and St. Louis.

We have thought proper to print a large edition of the entire article in pamphlet form—which will be forwarded to every section of the country. The project is an immense one, but the plan is perfectly feasible, and would, we have no doubt, if consummated, prove a most profitable undertaking.

#### A few Thoughts on Western Commerce.

DE BOW—in the last number of his "Commercial Review, for the South and West,"—has a well written, and very logical article, by a contributor, upon the contest which is now going on (and which must be one of the highest future importance,) between the East and West, for the traffic of the Mississippi Valley. We have perused this article with attention, and but for its great length, we should be happy to place it, entire, before our readers. The ground taken by the writer is, that the great and growing commerce of the Western country has now become of such vast importance, that a fierce rivalry has sprung up, and is destined to be carried on with determined vigor, whether the trade of that section shall be thrown into New Orleans, or given to the Atlantic cities. Whether the "Crescent City" shall continue to receive the benefits of the traffic of the Great West, by way of the Mississippi River, or whether Boston, New York, Philadelphia, and Baltimore, shall monopolize it?

The activity now prevailing in the Western States, but more especially in Pennsylvania, in reference to railroads leading westward, it seems, has aroused

the jealousy of our brethren in New Orleans—and the question may be very appropriately asked—if the contest for this traffic is not to be decided in after years, "why all this vast expenditure of money in building railroads, digging canals, etc." This is the point to be decided. The mightiest energies of the East and North-East must be exerted to protect and maintain what they now hold by reason of their exertions in the early history of railroads and canals. The position held towards the West, by the States of Pennsylvania, New York, and Massachusetts, by their existing means of communication, secures to those States the preference, at this time; and if the contemplated internal improvements of Pennsylvania are carried out successfully, there can be no competition with her interests (in a general view) so far as the trade of Ohio, and the country bordering on the lower Lakes, are concerned.

The writer of the article to which we have thus briefly alluded, is desirous of impressing the fact upon the minds of the citizens of New Orleans, that perishable property—as flour, corn, wheat, etc., suffers very materially, after shipment upon the Mississippi River, from injuries to which all produce is liable after reaching the New Orleans warehouses—from expenses incurred in sending it forward from the West to, or by way of New Orleans, when intended for shipment thence, abroad or coastwise—from the risks of the climate—from want of conveniences for storage—from injury occasioned by the muddy streets and docks—and from the risks of snags, etc., upon the river, the increased rates of insurance consequent, etc., etc. All these disadvantages are noted under separate heads—and an appeal is made to the community to come forward and devise means to overcome all these difficulties—and for why? Because there is an evident determination to establish a railroad communication direct from the Ohio river to the Atlantic, and a fair prospect of a continuous chain of road from St. Louis (or some point lower, even, on the river,) to the Atlantic coast!

New Orleans is a great city; but the immense trade which has been carried on between the East and the West—via New Orleans, must, in the natural progress of events, become a matter too great to be turned away from channels (though "artificial") which in these days of internal improvements, offer so many powerful and weighty advantages, as those which present themselves in the competition we have spoken of. Pennsylvania, by means of her CENTRAL RAILROAD—is destined, we believe, to be benefited more largely than any other of the Eastern or Middle States, in time to come—by the traffic which must flow eastward, and which is now, and which for years has been carried on, by way of New Orleans—to the East. Let her citizens look well to this—and bear in mind that the efforts of the Empire State will be brought to bear against her, that the capitalists of the South are jealous of her exertions—and that it depends on herself to say whether or not her people shall avail of the enormous benefits which are now flowing into other channels from her lack of means to receive them! We shall turn to this subject again.

#### Railroad Reports.

We have already given place in the columns of the *Journal* to the Annual Reports of several Roads and Companies for the past year—and a few are yet in hand, which we shall publish at an early day. The usual Annual Reports of some of the great public works of the country have not yet been received by us, and we conclude that such have not yet made their reports for the year past. We shall be happy

to see them all among our files—as soon as may be—and parties interested will please take the hint.

#### English Iron Trade.

By the arrival of the CAMBERIA steamer, we are in receipt of our London and Liverpool files—from which we gather that the *Iron Trade* generally remains in about the same state as at last advices.—The market, if any change was perceptible, was not quite so brisk as last accounts reported—and for certain descriptions of pig, slightly reduced rates are quoted. Buyers have purchased freely, however, and the prices of manufactured iron continue fully as high as a month ago. Wilmer & Smith say that in Liverpool, large quantities of iron have been sold during the last month, principally for railway and other public purposes; the consumption among the machine makers in the cotton and woollen districts has been much diminished—these trades being flat. The exportation of iron has been scarcely an average, considering the amount of pressure on the money market—the claims of Ireland for relief, which must be granted on an extensive scale, and other depressing influences. The prices of iron are well supported, and we have no reason to expect any material reduction, as the makers are still well employed, and pig iron is scarce. The following are the present rates in Liverpool: No. 1 Scotch pig, £4 5; Merchant bar, £ 10; best Rolled, £10 15; Hoop, £11 5; Sheet, £12.

In the London market, the transactions in iron are on a more restricted scale, the tightness of the money market having an unfavorable influence on prices of all descriptions. In Scotch pig only a small business is reported at a further decline of 1s. to 1s 6d on last week's rates, No. 1 selling at 72s 6d to 73s, and mixed numbers 71s to 72s cash; these rates are, however, quite nominal, and it is more easy to buy than sell. Welsh and Staffordshire are quiet; last rates are barely maintained. Rails are dull, and now not more than £9 to £9 15s cash can be obtained. In foreign iron no business reported. Spelter again advanced 20s, but sales have been stopped owing to the small quantity here and the high rates asked; some business is reported at £22 to £22 5s, and for arrival at about £21 5s. Copper is very scarce and firm, but as yet no prices are fixed by the smelters. Lead and steel remain nominally the same. In the value of British tin no change has taken place, and it is very scarce, some small lots of Straits are reported this week at 98s to 98s 6d.—In other metals no change, and but little business transacted.

#### Locomotive Manufactory.

We take pleasure in calling the attention of those interested in railroad matters, to the excellent locomotive building establishment of Messrs. HINCKLEY & DRURY, Boston.

It is now about six years since they commenced building Locomotive Engines, at which time the six wheel engine, with outside connexions, (weighing about ten tons) was considered sufficient for the passenger business upon the New England roads.

In consequence of the regular increase of business on these roads, from that time to this, they have been called upon for engines of an increased capacity, equal to the calls of business; and now have orders for passenger engines, weighing twenty-two tons, called the "eight wheel engine"—inside connexions, crank axle, with four driving wheels, and a truck; which are coming into general use in that part of the country.

There were strong objections to the crank axles, when they were first brought into use, from the fre-

quent failure of the cranks; but since making some improvements, such as adding another set of drivers, and heavier crank axles, they are now considered by the managers of our northern roads, the best kind of machine in use, for the passenger business; as they can be run at a high speed, without the great lateral motion of those of the outside connexion, and consequently with less injury to the track.

The driving wheels used by Messrs. Hinckley & Drury, are nothing less than five feet in diameter for passenger engines, and they have gone as high as six feet. We learn that this house has now orders for six months to come, for at least one machine a week, and for none of less weight than sixteen tons.

The manufacturers do not pretend that their machines are superior to those manufactured elsewhere, but being in the neighborhood where those machines are used, the various Superintendents are enabled to call and dictate how they choose to have their work done—and we are happy to know that perfect satisfaction has thus far been given—where their locomotives have had a trial. We commend the house of Hinckley & Drury to the general notice of our readers.

#### Railroad Matters.

A Correspondent of Hunt's Merchants' Magazine, writes as follows:—"In your number for January, is a statement of the quantity of railroad iron now made in the United States, taken from the Pottsville Miners' Journal, in which it is stated, that the first railroad iron made in this country was in 1844, but does not mention by whom. As this is a very prominent article in our manufactures, it is desirable the date of its commencement should be accurately known. I believe the first made here, was by the Great Western Iron Company, on the Allegheny river, about 40 miles above Pittsburg; of which company, Mr. Knowles Taylor, of N. York, was the president, and principal projector. In January, 1842, this company had 200 tons railroad iron ready for delivery at Cincinnati, for a railroad in Indiana, at \$50 per ton, at which price they lost money. This company is now called the Brady's Bend Iron Works, and is entitled to the credit of making the first railroad iron ever made in the U. States."

We are happy to be informed, says the Herald, that the subscriptions to the Hudson River Railroad now reaches upwards of \$2,000,000. Over \$90,000 were obtained Friday. The chances of this great work are now favorable, and a little more assistance from our citizens will secure its construction.

The citizens of Danvers, in town meeting, 125 years to 3 days, have passed resolutions approving of the project of a railroad from that town, through Lynn and Malden to Boston.

The Danvers Courier states that the petitioners in behalf of a railroad from Salem, through Danvers and South Reading to Lowell, have secured the services of J. W. Proctor, Esq., of that town, and E. H. Derby, Esq., of Boston, as their counsel.

We learn that the Hon. George Moffat having declined the office of president of the St. Lawrence and Atlantic railroad company on account of the pressure of private business, the directors proceeded on the 23d ult. to elect the Hon. A. N. Morin, president.

The net income of the Connecticut river railroad, extending from Springfield to Greenfield, (capital \$1,000,000) during the year 1846, was \$36,494 56. The cost of operating the road has not exceeded 35 cents per mile.

The Western Railroad Directors have recently

created 1,500 new shares, under the act of March, 1845, which are offered the stockholders at par, on the 4th of March next, in the proportion of one new share to every 20 of the old. These shares are entitled to the July dividend. This addition makes the whole number of shares 35,500 at the present time. The directors have also petitioned the legislature for an increased capital of about one million and a half of dollars, to be created from time to time, as the increased business of the road may require it; making the whole future capital ten millions. Probably none of it will be created until the property is an eight per cent. stock, which it bids fair to be in the present year—the increase of receipts in the past nine weeks having been \$33,133 82.

The receipts of the Boston and Worcester road, says the Advertiser, from passengers during the past year, amounted to \$279,793, and those from transportation of merchandize, to \$260,165, making a total of the two items of \$539,958. The dividends of 4 per cent. each were paid, leaving a surplus of \$29,725 80. The number of passengers transported was 470,318; and the quantity of merchandize 179,325 tons.

The citizens of Mount Morris are taking vigorous measures for the construction of a plank road to Angelica. The Livingston (N. Y.) Whig says, the citizens of that place are ready to subscribe \$15,000, and those of Angelica an equal amount. The consummation of such an enterprise must prove of vast benefit to the village of Mount Morris. The great increase of trade it would bring, would be an ample return for the investment.

It is stated in a Dublin paper that a railroad laborer, near Armaugh, Ireland, lately won a wager of \$10 for stowing away, in "nature's bread basket," six four-penny loaves of bread, three pounds of fat bacon, and drinking all the tea from 3½ ounces of the China herb. This was the quantum appointed for him to eat at one meal; but before the gourmand was satisfied he asked for another eight-penny loaf, and demolished it, together with an additional pound and a half of bacon.

The Norwich and Worcester railroad company have contracted for a large steamer, to take the place of the ill-starred Atlantic.

Those who take ordinary care of themselves and are prudent, says an exchange, it is proved by the calculation of experience in England, stand only one chance out of half a million of meeting with any injury upon a railroad.

#### St. Lawrence and Atlantic Railroad.

A late report made to this company, at a meeting held in Montreal, gives the most cheering accounts of the prospects of this road.

The Canadian company has entered upon its part of the work with great spirit, and apparently with most reasonable expectation of early profitable results.

They have placed forty-five miles of the road under contract, and the work of grading was commenced more than a month ago.

Mr. Galt has again gone to England, where, among other commissions, he is to contract for the rails, and the expectation is expressed, that so much of the road will be opened in the course of next year.

It is said that the prospects of the route improve on both sides of the line, as the surveys are perfected.

The encouraging fact will be observed, that responsible contractors, on the Canadian road, have agreed to take twenty-five per cent. of their contracts in the stock of the road.

#### Great Central Railroad from Philadelphia to St. Louis.

BY JOHN A. ROEBLING, C. E.

Written for the Railroad Journal, and read before the Board of Trade of Pittsburg.

(Continued from page 125.)

The history of railways has already furnished a sufficient number of facts, and of reliable data, for the establishment of principles, upon which the success of railroad transportation may be safely predicated.

Railroads, like all other great mechanical structures, which are calculated for extensive operations, are necessarily very expensive in their first construction. They are to be operated at other time and labor-saving machines are. To overcome those resistances which present themselves to the movement of heavy masses, a costly and complicated machinery is required, and to be constructed very strong and durable. Economy of working grows out of the perfection of the machinery, and other means applied. The more perfect the latter are, the better the operations will succeed, and the more can be produced. But from this follows that the profitable success of mechanical operations will greatly depend upon the amount of work done. A cotton mill, for instance, with its expensive machinery, will not pay for itself when only worked four hours per day; but it may prove a valuable investment when operated twelve hours, or still better, without any interruption. The same applies to a railroad.

In order to show the rapid reduction of expense of transportation, with the increase of tonnage, I have calculated the following table, which will be found nearly correct when applied to the best American railroad. The first cost of a first rate double track road is assumed at \$50,000 per mile. The tonnage includes passenger trains as freight trains, locomotives, cars and all.

Gross tonnage.	Maintenance of road per mile per annum for total gr. tonnage.	Charge per gross ton per mile.			
		6 per cent. interest on capital of \$50,000 per mile.	Maintenance of road.	Working expenses.	Total charge.
40,000	\$ 200	Cents. 7.5	Cents. .5	Cents. .5	8.5
60,000	230	5.0	.383	.5	5.883
80,000	260	3.75	.325	.5	4.575
100,000	290	3.0	.29	.5	3.79
150,000	365	2.0	.343	.5	2.743
200,000	440	1.5	.29	.5	2.29
500,000	890	0.6	.178	.5	1.278
1,000,000	1640	0.3	.164	.5	.964
2,000,000	3140	0.15	.157	.5	.807

This table shows, conclusively, how important it is to do a large business. We see that with a business of but 40,000 gross tons annually, we have to charge 8½ cts. per gross ton per mile, to be enabled to declare a dividend of 6 per cent. upon the capital invested. But with a business of 2,000,000 gross tons, we need only charge .807 cents per ton per mile, in order to make the same dividend. The Reading Railroad is the only road in the world, the gross tonnage of which approaches 2,000,000 a year. In applying the above table to this road, we have to double the charge of interest, as the original cost of this road, including outfit, depots and all, amounts to \$100,000 per mile. This gives the total charge per ton per mile .957 cents. And as the proportion of the gross tonnage to the net tonnage on that road is nearly as 3:2, we get the expense of transportation for each ton net 1.31 cents per mile. With a business therefore of 1,333,000 tons of coal per annum, and allowing 6 per cent. interest upon the capital expended, the Reading company should be able to transport coal from Pottsville to Philadel-

phia, 100 miles, at the rate of \$1 21 per ton. Owing to the favorable grade of that road, which is descending in the direction of the traffic, the working expenses do not amount to 1 cent per gross ton per mile.\* The working expenses of one ton net of goods on the Belgian railways, are stated at 9 cents per mile. I have referred to the Reading railroad only for the sake of illustration.

On examination of the above table, we arrive at another important conclusion, viz: that to accommodate a certain amount of business, more roads than one will be injurious to the public. Two companies, in place of reducing charges, have to increase them, in order to make up for the reduction of tonnage.

The true interest of Pittsburg is, to have but one road in place of two to the seaboard. One company can afford to work to the advantage of the community at large, by making a good road in the first instance, keeping it and its machinery in good repair, running more numerous trains, more regular and faster, and all this at a lower rate of charges. Two companies would have to divide the revenue, and would therefore have to charge double for the same accommodation. *Competition may become the ruin as well as the life of business.* The rivalry of the different leading routes through the neighboring States will be quite sufficient to preserve us against the abuses of an apparent monopoly. It will be admitted, by and by, that the Connelville road, if made, will prove a drawback, instead of a benefit, to the commerce and general interests of the city of Pittsburg. With the support of the Great Central road alone, we shall be able to monopolize the western trade, in competition to the other great rival lines, *by reducing charges sufficiently low.* With two roads, however, one to Philadelphia, the other to Baltimore, and a divided business, our ability to compete will be greatly lessened.

That road will secure most business, which first shall connect with the improvements of the State of Ohio, and render them tributary. To stop at Pittsburg would therefore be a half measure. Early measures should be taken to secure a continuation to Columbus. Before I however continue my remarks, upon the comparative prospects of the Great Central, and of the Baltimore and Ohio railroad, I will refer to the Great Virginia route, projected from Richmond to Guyandotte.

This route, when constructed, will form the most direct communication between the Atlantic and the west. Both in regard to grades as well as distances this road will be able to compete successfully with any of the northern lines for a considerable portion of the southwestern trade. The charter granted to the company of the Richmond and Ohio railroad, by the Virginia legislature last winter, may be pronounced one of the most liberal and favorable in its provisions, ever granted to any company. Indeed it appears, that Virginia regards the construction of this road, as of vital importance to the future prosperity of that State, and has accordingly held out great inducements to capitalists to embark in that enterprise. This road will form the most direct route to Cincinnati, and if continued from Richmond to Norfolk, may raise the latter place to one of the first sea ports on the Atlantic coast. The fact is, that the Richmond and Ohio road will prove the most formidable rival of the Baltimore and Ohio, as it will intercept all the trade of the Ohio river below Parkersburg, and will not allow it to reach the termination of the Baltimore line. Norfolk be-

\* No allowance made for the expense of running the cars back empty.

ing located at the mouth of the Chesapeake bay, would hold out greater inducements than Baltimore as a place for shipping.

Great as the advantages of the Richmond, and of the Baltimore routes are, they cannot divert much of the traffic, which may be said to belong legitimately to the Great Central road, provided the latter be wisely directed.

Philadelphia possesses, as the terminus of the Great Central, superior advantages over Baltimore, as well as Richmond:

1. As a greater focus of capital.
2. As a greater manufacturing centre.
3. As a greater commercial point.
4. As a more populous place.
5. On account of its closer proximity to New York, the greatest seaport on the Atlantic.

The future success of the Central railroad, however, may be predicated upon the fact, that it will form the *main stem* of an immense system of railroads, canals, rivers and common roads, most of which are already in successful operation. The whole distance of railway from Philadelphia to St. Louis will not exceed 1000 miles. Now let us commence at the eastern terminus, and enumerate the extent of all the improvements which will be rendered tributary, and may be considered branches of the main trunk line.

	Miles.
Length of trunk line itself.....	1000
Harrisburg and Chambersburg railroad.....	52
Harrisburg, York and Baltimore railroad.....	110
Pittsburg branches to Cleveland and Erie.....	230
Erie Extension canal, Cross-Cut, Sandy and Beaver.....	260
Ohio canal and branches.....	334
Muskingum slackwater—about.....	80
Columbus and Cleveland railroad.....	120
Cincinnati and Sandusky.....	225
Miami canal.....	190
Whitewater canal.....	76
Madison railroad.....	85
Wabash canal and river—say.....	450
Railroads contemplated in Illinois—about.....	200
An aggregate extent of nearly 3500 miles of active lines. The above distances are to be considered only as approximate.	

A French engineer has lately recommended to his government a system of trunk and branch lines, to be adopted in place of independent lines; the same views appear to have been sustained in parliament, during the late discussions on the merits of new lines, proposed. The remarks lately made in relation to this subject by the Railway Chronicle, (See American Railroad Journal, No. 533,) are so directly bearing upon the question of the leading thoroughfares of the United States, that the attentive perusal of this article is much to be recommended.

To insure that great amount of traffic, which is necessary for the success of the Great Central road, the location of its main trunk line should be undeviating and direct in its general course; the most important towns should be touched, and its terminus should be located at the most flourishing city of the west. In proportion as facilities of travel and transportation are offered by this trunk line, will the business of the adjacent country be attracted. All interruptions and delay should be avoided. Goods shipped on board of cars at St. Louis, must be sent through without any transshipment, and vice versa. The better the above conditions are fulfilled, the more expeditious and cheaper business can be conducted. A certain amount of business is necessary to cover general expenses, as the interest upon the capital, general management, principal maintenance of road, etc., etc. Any additional traffic beyond this,

will swell the receipts of the road, without adding proportionally to its expenses.

It is only by means of a common trunk line, and numerous branches, or lateral lines of transport, that large trains can be collected, and that trains can be run more numerous on the main line. A *through* train of passengers, for instance, starts at St. Louis towards Philadelphia, running 25 miles per hour, and allowed to reach the latter place within 48 hours, including all stoppages. This train will stop, collect and distribute passengers, at Vandalia, Terre Haute, Indianapolis, Richmond, Springfield, Columbus, Salem, Steubenville, Pittsburg, Harrisburg and Lancaster. Before the train reaches Philadelphia, it will have done an immense way business, and become much enlarged. Two such trains daily, each way, will accommodate 300,000 passengers annually. Other trains may be run for the accommodation of the local travel exclusively. The business on the branch lines must be so arranged, as to correspond with that on the main line.

By applying some of the principles developed by Mr. Ellet in his *laws of trade*, and decreasing the charges on the main line, in a certain ratio, as the distance increases the attractive power of this road, by means of its numerous branch lines, can be much increased. I will, for instance, mention an item of transportation which can be made to contribute much to the receipts of this road, and would, if fairly introduced, prove of vast benefit to the east as well as to the west. Fat cattle, hogs, and sheep, can be advantageously transported from the rich prairies and cornfields of Illinois, Indiana and Ohio, by railway to Philadelphia, without losing any weight, and at a profitable rate. A fat steer, weighing 1000 pounds, is now worth in Illinois, \$10, its transportation will cost at the rate of 2 cents per ton per mile, over say 900 miles of road \$9, making its value, including attendance and fodder, say \$30 in Philadelphia, where it will sell at the rate of \$30 to \$40. The immense droves of cattle, hogs and sheep, which are now annually driven from the west to the east, at a great loss of weight, and expense of time and money, may all be conducted on this railway. Here will be, indeed, a great national saving effected, and nobody injured. There is no doubt, if this traffic was fairly established, the exportation of meat to Europe, during the fall and winter season, could be carried on very profitably. The transportation of fat cattle, on one of the Hungarian railways, for the supply of the city of Vienna, forms one of the principal sources of revenue of that road. The grand object of railways is to facilitate commerce and intercourse. It is, therefore, the duty, as well as the interest, of a railroad company, to keep this great aim constantly in view. It is plain that such magnificent results as the direct transportation of the great staples of the west, over a thousand miles of railway, cannot be attained on a poorly located and constructed railroad, or with an insufficient stock of machinery, or by subjecting it to the delay and expense of transshipment and agencies; nor can it be accomplished by taxing such an immense traffic with all the expenses which would grow out of an increase of distance, caused by a circuitous location through every village of the country. Just in proportion as the facilities of transportation to the far west will be increased, will goods be sent and received by Philadelphia, Pittsburg, the whole State of Pennsylvania, and the western States.

Instead of constructing a number of independent lines to Erie, Cleveland, Sandusky, Toledo, Chicago, Cincinnati, Indianapolis and St. Louis, the ag-

gregate distances of which would exceed 3000 miles, and of which none could attract a sufficient amount of business to maintain a first rate establishment; it is proposed to construct *one grand trunk line to St. Louis*, and make this a road of first rate capacity, capable of conducting the whole business of the west at the lowest rate of charges, and with the least delay. The formation and management of the branch lines may be left to the different sections of country where they are wanted. A controlling power will be exercised over the branches by modifying the charges on the main line, in proportion to those on the side lines.

At the risk of another repetition, I will again review some of the most prominent principles which should be observed when projecting a great system of railways over an extensive country, and then conclude my remarks on the capability of the Great Central road to compete successfully with its northern and southern rivals.

"No two roads shall be made where one can accommodate the business.

"The whole country should be divided into railway systems, with main trunk lines forming direct communication between the most important commercial towns, and lateral branches extending thro' the adjacent country, also connecting the main trunk lines.

"The main lines should be so located as to interfere as little as possible with each other.

"The main part of the travel should be accommodated by passing through the principal centres of population.

"The freight business should be attracted from the country itself, by branch lines and intersecting improvements which will discharge directly and save transshipment and commission.

"The character of the road, as to lines, grades, and superstructure, should be adapted to the magnitude of the trade; this trade should be estimated with a due regard to the future advance of population, opening of new resources, and greater extension of business generally, in consequence of the increased facilities of transportation offered.

"The expense of construction may be increased in proportion as the annual charges of transportation, etc., are thereby diminished, with due allowance for the increase of business, which may reasonably be expected, in consequence of the greater perfection and capacity of the road."

If we proceed in the location of the Great Central road, according to these principles, and secure a connection with the west, before it can be done by our rivals, we shall be certain of success. We should at once declare our intention to extend our line to St. Louis, and carry out our design vigorously. None of the neighboring routes will thereby be excluded from the west; but it would be folly to carry two main lines into the same district, thereby destroying each other, and injuring the whole community. When the Baltimore and Ohio company projected a branch to Pittsburg and the main line to Wheeling, their object was to pursue a similar route through the west, which is now here proposed. Their plan, however, was formed under the impression that a railroad through Pennsylvania was impracticable, and could never be made. But the aspect of the case is now totally changed. Pennsylvania has discovered a route as good as the Baltimore and Ohio line, and will construct a road from Philadelphia to Pittsburg without any further delay, and will have it completed long before the Baltimore and Ohio can reach the Ohio river. This will necessarily change the whole policy of the Bal-

timore and Ohio company. Will this company be bold enough to run a race for life and death, with her more powerful neighbor of the Great Central railroad? Certainly not! If the stockholders of the Baltimore and Ohio railroad are led by wise counsel, they will examine their true position, and consider well the chances which are left to them, between the Great Central route in the north, and the Richmond and Ohio in the south. Their true interest will be to pursue a course as central as possible between the two, and strike the Ohio near the mouth of the Little Kanawha, or the Muskingum. There they will be certain of securing a *portion* of the Ohio trade. By extending their road to Columbus, they will then tap the business of the Great Central road; with what success, will entirely depend upon the organization of the latter.

That company will succeed best which will provide the greatest facilities of transportation, and have the control of the main stem to St. Louis, and of its branches. The merchant of the west will soon have a choice of five great routes, all leading to the Atlantic. They may choose to go by the

Richmond and Ohio,  
Baltimore and Ohio,  
Great Central,  
New York and Erie, or  
Boston and Michigan line.

The Virginia route is not contemplated to be prosecuted further west than Guyandot. The Ohio river will then form its continuation to Cincinnati. It cannot be denied, that the prospects of this route are very flattering. A railroad from Louisville to Guyandot, by way of Frankford and Lexington, would secure to their line a large portion of the Kentucky trade. Some of the south western travel may also take the Virginia route; if the Great Central road, however, is well managed, it will offer much greater facilities to Philadelphia, as well as to New York and Boston. Excepting those passengers from the west, who are called on business to Baltimore, the great bulk of travel which passes through St. Louis and Cincinnati, will prefer the great Central route for Philadelphia, as well as for New York and Boston, as the nearest, most expeditious, and cheapest.

It is true that the Baltimore and Ohio, when connecting with the Great Central at Columbus, or some other eligible point, will have an opportunity of diverting a portion of the travel; but this can only be accomplished by offering *greater facilities*, viz: greater speed and comfort at a lower rate of charges. But how will the Baltimore and Ohio, with an inferior road, and much smaller business, be able to sustain such competition, when the additional distance and fare from Baltimore to Philadelphia is against that route, for all the travel north of Baltimore?

The Baltimore and Ohio railroad company, when reflecting on the position of their road, situated as it will be, between two powerful rival lines, will discover that their safety depends upon the creation of an independent business, rather than uncertain result of a hazardous competition. Two things are certain, there is not scope enough of country to continue the main stem of the Baltimore and Ohio, as a great trunk line west, without interfering greatly with the extensive operations of the Great Central road. Nor will that company possess sufficient influence and capital to enable it to undertake, successfully, a struggle with her more powerful rival.

It may be repeated again, which ever line shall enjoy the control of the main stem to St. Louis, will command the western travel and business. If that

control is exercised by Pennsylvania capital, the business will go by that route, and the Baltimore and Ohio connection will only form a subordinate branch.

It is not to be denied, that the river trade of the city of Pittsburg will be seriously affected by the completion of the Baltimore and Ohio railroad, as well as of the Richmond and Ohio road. The trade below Marietta will be lost. But, on the other hand, we have the prospect of being richly indemnified by the vast trade and travel which is destined to flow through that great system of improvement, of which the Great Central road will form the main trunk line. The tributaries of commerce, which from their extensive net of artificial improvements, will flow like a torrent into Pennsylvania, will not only richly cover the partial loss of an uncertain river navigation, but it will also greatly magnify the extent and operations of our manufactures.

The question may be asked, why it is not recommended to pass with the main line of the Great Central railroad through Cincinnati, the Queen of the West? The reasons are obvious. As the grand object of the trunk line is, to tap the Lake trade at its principal sources, we should greatly weaken our ability of doing so, by keeping too far South. We should thereby give the New York line an undue advantage over us, while we would gain but very little more on the South. The greater population and traffic will, for the future, be found in the *growing* regions, which are situated north of Cincinnati, or north of the 39th degree of latitude. New York and Boston are directing their efforts to these regions. The fact is, that the position of St. Louis is most too far south for the western terminus of our line. But it is highly important to reach this city, which is destined to be the greatest inland city on this continent. On the other hand, the navigation of the immense water courses of the Missouri and Mississippi, will concentrate such a vast trade at St. Louis, that the future accumulation of this traffic may equal the *aggregate* business derived from the States of Ohio, Indiana and Illinois. Cincinnati is making efforts to reach New York. We will meet it on its way and offer it a more expeditious route. The railroad now in operation from Cincinnati to Springfield, will offer as great facilities to the former city, for the use of the Central road, as could be created by passing through it. Another objection to a location through Cincinnati would be, that a portion of the St. Louis trade would be diverted to the Virginia route, by following the river from Cincinnati to Guyandot. Cincinnati, itself, would derive little additional advantage from making it a point in the main line. That city will shortly form the very centre of a great net of railways, diverging in all directions.

A location north of the proposed route, say due west of Pittsburg, would also appear objectionable for two reasons: First, it would enlarge the scope of country, for the extension of the main trunk line of the Baltimore and Ohio railroad. Secondly, it would be brought into too close a proximity with the New York line, along the southern shore of lake Erie. By pursuing, however, the route proposed, it may not be altogether improbable that the Baltimore and Ohio Company, instead of connecting with our main stem at Columbus, will prefer to pursue a direct course from Parkersburg to Cincinnati. The latter city will, of course, encourage such a plan. Baltimore will gain more by a direct connection with the Queen City, than they can accomplish by any other route. Such connection will enable them most effectually to compete successfully with the

Richmond and Ohio route. We, of course, shall be rejoiced to see the city of Baltimore and the Baltimore and Ohio railroad thrive well, if such can take place without affecting materially our own interests.

We shall not allow our policy to be governed by feelings of envy. A generous, high minded, and honorable rivalry shall prompt us in the pursuit of our enterprize—we will remember that the Great West offers room for us all!

(To be Continued.)

#### Atlantic and St. Lawrence Railroad.

The Portland Bulletin has the following intelligence concerning the progress of this work:—"Continued trains of teams heavily laden with piles and timber for abutments to protect the railroad from the influence of the sea, and for bridging, have been pouring into the city for a fortnight past. A bridge for a double track, below low water mark, is to be built from Fish Point (Mount Joy,) to India wharf, foot of India street. A contract has been made with Messrs. Seward, Merrill and George Turner for the completion of this bridge, and the building will commence immediately. The company have purchased India and Steamboat wharves, with a view, we believe, of ultimately building an immense depot in that section. The bridge to the eastward of, and running nearly parallel with Turkey's bridge, over Back Cove, is, we understand, to be built by the company.

"The second section of this road, extending from North Yarmouth to the old tavern road near Lewiston, a distance of 17 miles, is rapidly leveling before the efforts of a very large gang of hands. The dykes and culverts are nearly finished, and large sections of the grades are ready for the layer of gravel.

"Preparations are in progress for building the bridges over the Presumpscot and Royal rivers, and it is not improbable that by next Fall the cars will be running on the whole route between this city and Lewiston. The Waterville railroad enterprize seems to meet with especial favor from all quarters, with the exception of the Boston influence, which as usual is opposed to every improvement that does not concentrate in the City of Nations. The amount necessary for the organization of the company has already been subscribed, and an organization will immediately commence."

#### Lewiston and Portland Railroad.

The Portland Advertiser has a lengthy and spirited article in a late number, upon the railroad meeting which took place there on Saturday night week. The City Hall was crowded full with people, combining the substantial strength of Portland, of all classes and interests. The Mayor, E. GREELY, Esq., presided, and speeches were made by Wm. Goode-now, Esq., Judge Ware, Messrs. Jos. Adams, John Anderson, Judge Preble, R. A. L. Codman, John A. Poor and J. S. Little—each of whom, says the Advertiser, in a varied line of fact and argument, displayed and enforced the principles of science and public economy, applicable to this enterprize, and blending the whole with appeals, regarding not only the interest of Portland, but the development and advantage of the whole State, which were answered with earnest and frequent applause. A series of resolutions were passed by the meeting, from which we extract the following.

*Resolved*, That the people of Maine should take a strong and general interest in the early establishment of a central line of railroad connecting the interior of the State with the seaboard in the direction affording the nearest and best access to the principal markets.

*Resolved*, That the railroad now chartered from Lewiston to Waterville is most favorably located to form an important part of such a central line, both because it is as direct as any that can practically be adopted, and because it will reach and benefit a great variety and amount of the local productive resources of the State.

*Resolved*, That we acknowledge the generous and liberal spirit with which so large a portion of the people in the interior are seeking to unite themselves with us in this enterprize, and that Portland must not be found wanting in reciprocating an equal cordiality and effective cooperation.

*Resolved*, That the amount of \$100,000, which is expected from Portland as a subscription to this stock, is not larger than we ought to raise—and that it can be done—and must be done—and shall be done forthwith.

*Resolved*, That we acknowledge the valuable services of those of our fellow-citizens who have already moved in this enterprize, and have subscribed or procured a large part of the amount above named; and that this meeting will appoint a committee of twenty-one to go forward and procure the balance of the subscription in the shortest possible time.

#### Miscellaneous.

*Another Great Improvement in Mechanism for Speed in Printing.*—Messrs. R. Hoe & Co., of New York, have been some months past manufacturing to order, for the Public Ledger, a printing machine, of a different principle from any press hitherto used, and calculated for a rate of speed and rapidity of operation entirely in advance of any press yet invented for use on American made paper. The machine was invented by Col. R. M. Hoe, the senior partner of that extensive manufacturing house, under whose care and superintendence this one, the first and only one yet manufactured, or even ordered, has been built. It has been completed, and we were called upon last week to go to New York and view the machine in operation before having it taken down to be forwarded here. We have done so, and had the pleasure of seeing it run at the rate of about ten thousand impressions per hour. The principle is such that it can be carried up to twelve, fifteen, eighteen, and even twenty thousand impressions per hour. As far as speed alone is concerned, the principle of this invention may be said to be the acme of perfection in the art of printing, as is Morse's Electro-magnetic Telegraph in the speed of transmitting information.—*Philadelphia Ledger*.

*The Augusta Grist Mill.*—Of all the new machinery recently put in operation upon the Kennebec dam, none seems to promise more satisfactory results than the new grist mill recently erected by J. D. Emery, Esq. This mill is constructed on the most improved plan, so far as machinery is concerned, and will

contain when completed, six runs of the best quality of Burr stones, besides a cornercracker, cleansers, etc. Four runs of these stones, for the custom work, with the necessary apparatus for cleansing, bolting, etc., and a corn cracker, are now in operation. Two additional stones, designed for the manufacture of flour for the market, will be set in operation as soon as the river opens in the Spring. The machinery of this portion of the mill is of the very first quality, and will produce flour fully equal to the best now manufactured in the country. That such an establishment was demanded by the wants of the community is fully established by the fact that it has been constantly thronged with customers since it was first started. The machinery works in the most satisfactory manner. The proprietor sent us a specimen of Indian meal made from corn which had been cracked with the cobs, and then ground. From this meal we have had some of the best "Jonny cake" we ever tasted. The machinery in this mill has been put up under the superintendence of Mr. David Beedy, Jr., a skillful and intelligent millwright.—*Augusta Age*.

*New Cannon.*—Mr. Isaac Detheridge has invented a cannon of a very novel and ingenious construction, for which he has a caveat at the Patent office. It is composed of rings and rods, with screws at the ends, and can be taken apart and put together again in a few minutes. It is made entirely of wrought iron, and overcomes, it is asserted, the difficulties complained of in that species of guns. Besides which, for crossing mountains and morasses, there could not be anything more complete, as it can be taken apart and loaded on the backs of mules or packed in the ordinary baggage train. It is also as safe in firing as any other cannon: perhaps all the attention having been paid to that quality.

*Improved Carriage Spring.*—Mr. Wm. S. Thomas, of Norwich, Ct., has furnished us with a drawing and description of an ingenious and apparently excellent improvement in springs for coaches and light carriages. This improvement is not calculated to come into competition with that of Mr. Snow, described in this paper two or three weeks since, but may be preferred on light fancy coaches, etc. The elliptic spring is in this retained, with the addition of a longitudinal U spring with a peculiarly broad iron reach, constructed to accommodate the U springs, which are moreover to be occasionally supported by additional interior plates. The inventor is but an apprentice, or at least a minor, and should be encouraged to persevere in advancing improvements, and with accumulated experience will probably be enabled to introduce improvements of greater magnitude.—*N. York Farmer*.

*Valuable Discovery.*—Mr. L. B. Swan, of Rochester, has discovered a new solution or exciting liquid for the galvanic battery, which saves 75 per cent in the material employed, besides a large amount of labor and attention. It has been used at the Telegraph station in that city with great success. Mr. Swan has applied for letters patent.

**Discovery of Mezzotinto.**—It is well known that many of the important discoveries in the arts and sciences, have been quite accidental, or have arisen from very trivial circumstances. The beautiful manner of finishing prints, called mezzotinto, was discovered by Prince Rupert, who, going out early one morning, observed a sentinel, at some distance from his post, very busy doing something to his piece. The Prince inquired what he was about.—The soldier replied that the dew having fallen in the night, had made his fusée rusty, and that he was scraping and cleaning it. The Prince on looking at it, was struck with something like a figure eaten into the barrel, with enumerable little holes close together, like friezed work on gold or silver, part of which the soldier had scraped away. He concluded that some contrivance might be found to cover a brass plate with such a grained ground of fine pressed holes, which would undoubtedly give an impression to all black, and by scraping away proper parts, the smooth superficies would leave the rest of the paper white. Communicating this idea to a painter, they made several experiments and at last invented a steel roller, cut with tools to make teeth like a file or rasp, with projecting points, which produced the black ground, which being scraped away and diminished at pleasure, left the gradations of light.

**BACK VOLUMES OF THE RAILROAD JOURNAL** for sale at the office, No. 105 Chestnut street.

**A. & G. RALSTON & CO., NO. 4**  
South Front St., Philadelphia, Pa.  
Have now on hand, for sale, Railroad Iron, viz: 180 tons 2½ x 4 inch Flat Punched Rails, 20 ft. long.  
25 " 2½ x 4 " Flange Iron Rails.  
75 " 1 x 4 " Flat Punched Bars for Drafts in Mines. A full assortment of Railroad Spikes, Boat and Ship Spikes. They are prepared to execute orders for every description of Railroad Iron and Fixtures.

**RAY'S EQUALIZING RAILWAY TRUCK.—THE SUBSCRIBER** having recently formed a business connection in the City of New

York, expressly for the manufacture of the newly patented and highly approved Railroad Truck of Mr. Fowler M. Ray, is ready to receive orders for building the same, from Railroad Companies and Car Builders in the United States, and elsewhere.

The above Truck has now been in use from one to two years on several roads a sufficient length of time to test its durability, and other good qualities, and to satisfy those who have used it, as may be seen by reference to the certificates which follow this notice.

There have been several improvements lately introduced upon the Truck, such as additional springs in the bolster of passenger cars, making them delightful riding cars—adapting it to tenders, trucks forward of the locomotive, and freight cars, which, with its original good qualities, make it in all respects the most desirable truck now offered to the public.

Orders for the above, will, for the present, be executed at the New York Screw Mill, corner 33d street and 3d avenue, (late P. Cooper's rolling mills) and at the Steam Engine Shop of T. F. Secor & Co., foot of 9th street, East

**LOCOMOTIVE AND CAR AXLES.**  
The Subscribers are now prepared to receive orders for the well known and approved Reading Locomotive and Car Axles—drawn to any required pattern from Bloom Iron only. Address  
**SAM'L KIMBER & CO.,**  
Willow Street Wharf,  
Philadelphia, Pa.

**NOTICE TO RAILROAD CONTRACTORS.**  
Proposals will be received by the Subscriber, at the office of the Michigan Central Railroad Company, at Detroit, until the 16th day of February next, for Grading the first thirteen miles of the Extension of the Michigan Central Railroad, from Kalamazoo, westward; said thirteen miles contains about four hundred thousand cubic yards of earth work. Plans and Specifications will be ready for examination at the office of the subscriber after February 1st.  
**J. W. BROOKS, Supt. & Eng.**  
Detroit, January 5, 1847.

**RAILWAY IRON.—THE BEST QUALITY**  
Of English Heavy H Rails—60 lbs. to the yard—now in store, landing from the vessel, and on ship board to arrive, for sale on most favorable terms by  
**DAVIS, BROOKS & CO.,**  
Jan. 2. [11] 68 Broad St., New York.

**TO RAILROAD COMPANIES AND MANUFACTURERS** of railroad Machinery. The subscribers have for sale Am. and English bar iron, of all sizes; English blister, cast, shear and spring steel; Juniata rods; car axles, made of double refined iron; sheet and boiler iron, cut to pattern; tiers for locomotive engines, and other railroad carriage wheels, made from common and double refined B. O. iron; the latter a very superior article. The tires are made by Messrs. Baldwin & Whitney, locomotive engine manufacturers of this city. Orders addressed to them, or to us, will be promptly executed.

When the exact diameter of the wheel is stated in the order, a fit to those wheels is guaranteed, saving to the purchaser the expense of turning them out inside.  
**THOMAS & EDMUND GEORGE,**  
a45 N. E. cor. 12th and Market sts., Philad., Pa.

**RAILROAD IRON.—THE NEW JERSEY**  
Iron Company, Boonton, N. J., are now preparing to make Railroad Bars, and are ready to take orders or make contracts for Rails, deliverable after the first of December next. Apply to  
**FULLER & BROWN, Agent,**  
No. 139 Greenwich, corner of Cedar street.  
September 18, 1846. 10:39

**NICOLL'S PATENT SAFETY SWITCH**  
for Railroad Turnouts. This invention, for some time in successful operation on one of the principal railroads in the country, effectually prevents engines and their trains from running off the track at a switch, left wrong by accident or design. It acts independently of the main track rails, being laid down, or removed, without cutting or displacing them.

It is never touched by passing trains, except when in use, preventing their running off the track. It is simple in its construction and operation, requiring only two Castings and two Rails; the latter, even if much worn or used, not objectionable.

Working Models of the Safety Switch may be seen at Messrs. Davenport and Bridges, Cambridgeport, Mass., and at the office of the Railroad Journal, New York.

Plans, Specifications, and all information obtained on application to the Subscriber, Inventor, and Patentee  
**G. A. NICOLLS,**  
ja45 Reading, Pa.

**RAILROAD IRON.—THE SUBSCRIBER'S**  
New Rail Iron Mill at Phoenixville, Pa., is expected to be ready to go into operation by the 1st of September, and will be capable of turning out 30 to 40 tons of finished Rails per day. They are now prepared to receive orders to that extent, deliverable after the 1st of October next, for heavy rails of any pattern now in use, equal in quality and finish to best imported.

**PIG IRON.**—They are also receiving weekly 150 to 200 tons of No. 1 Phoenix Foundry Iron, well adapted for light castings.

**REEVES, BUCK & CO.,**  
45 North Water St., Philadelphia,  
or by their Agent, **ROBT. NICHOLS,**  
79 Water St., New York

**THE SUBSCRIBERS, AGENTS FOR**  
the sale of  
Codorus,  
Glendon,  
Spring Mill and  
Valley,  
Pig Iron.

Have now a supply, and respectfully solicit the patronage of persons engaged in the making of Machinery, for which purpose the above makes of Pig Iron are particularly adapted.

They are also sole Agents for Watson's celebrated Fire Bricks and prepared Kaolin or Fire Clay orders for which are promptly supplied.

**SAM'L KIMBER & CO.,**  
59 North Wharves,  
Philadelphia, Pa.

Jan. 14, 1846. [1y4]

river, (of which firm the subscriber was late a partner) under the immediate supervision of Mr. Ray himself.

Several sets of trucks containing the latest improvements have recently been turned out for the New York and Erie railroad, and the New Jersey Transportation company, which may be seen upon said roads.

The patronage of Railroad Companies and Car Builders is respectfully solicited.

**New York, May 4, 1846. W. H. CALKINS, and Others.**  
To all whom it may concern:—This is to certify that the New Haven, Hartford and Springfield railroad co., have had in use six sets of F. M. Ray's patent trucks for the last 20 months, during which time it appears to me, they have proved to be the best and most economical truck now in use.

[Signed,] **WILLIAM ROE, Supt of Power.**  
I certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Philadelphia and Reading railroad for some time past, under a passenger car.

For simplicity of construction, economy in cost, lightness of material, and extreme ease of motion, I consider it the best truck we have ever used. Its peculiar make also renders it less liable to be thrown off the track, when passing over any obstruction. We intend using it extensively under the passenger and freight cars of the above road.

**Reading, Pa., October 6, 1845. [Signed,] G. A. NICOLL,**  
Supt. Transportation, etc., Philadelphia and Reading Railroad.

To all whom it may concern:—This is to certify that the N. Jersey Railroad and Transportation company have used Fowler M. Ray's Truck for the last seven months, during which time it has operated to our entire satisfaction. I have no hesitation in saying that it is the simplest and most economical truck now in use.

[Signed,] **T. L. SMITH,**  
**Jersey City, November 4, 1845. N. Jersey Railroad and Transp. Co.**  
This is to certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Long Island railroad for the last year, under a freight car.

For simplicity of construction, economy in cost, lightness of material and ease of motion, I consider it equal to any truck we have in use.

**Long Island Railroad Depot, [Signed,] JOHN LEACH,**  
**Jamaica November 12, 1845. } 1y19 Sup't Motive Power.**

**RICH & CO'S IMPROVED PATENT SALAMANDER SAFES.**

Warranted free from dampness, as well as fire and thief proof.

Particular attention is invited to the following certificates, which speak for themselves:

TEST No. 10.

*Certificate from Mr. Silas C. Field, of Vicksburgh, Mississippi.*

On the morning of the 14th ult., the store owned and occupied by me in this city, was, with its contents, entirely consumed by fire. My stock of goods consisted of oil, rosin, lard, pork, sugar, molasses, liquors, and other articles of a combustible nature, in the midst of which was one of Rich's Improved Patent Salamander Safes, which I purchased last October of Mr. Isaac Bridge, New Orleans, and which contained my books and papers. This safe was red hot, and did not cool sufficiently to be opened until 16 hours after it was taken from the ruins. At the expiration of that time it was unlocked, when its contents proved to be entirely uninjured, and not even discolored. I deem this test sufficient to show that the high reputation enjoyed by Rich's Safes is well merited.

S. C. FIELD.

TEST No. 11.—*Certificate.*

By the fire which occurred in this village on the 27th July last, our Law Office, together with many other buildings, was destroyed—we had in our office one of Rich's Improved Patent Salamander Safes, which, though heated red hot, preserved, without being the least damaged, many papers valuable to our clients—the envelopes of a few papers being slightly scorched. Some twenty-four hours after the fire, the Safe was removed, and so hot was it, that several hours were required for it to cool off. Our office was in the second story of a large brick building, all the wood used in construction of said house being pitch pine. While the Safe was red hot, one of the walls tumbled in, and so injured the lock that it was necessary to break the door open. From this test, we feel no hesitancy in recommending "Rich's Patent Salamander Safe" as entirely fire proof.

GOREE & KING.

Marion, Ala., Sept. 15th, 1846.

*Still other Tests in the Great Fire of July 19, 1845.*

The undersigned purchased of A. S. Martin, No. 138½ Water street, one of Rich's Improved Patent Salamander Safes, which was in our store, No. 54 Exchange place. The store was entirely consumed in the great conflagration on the morning of the 19th inst. The safe was taken from the ruins 52 hours after, and on opening it, the books and papers were found entirely uninjured by fire, and only slightly wet—the leather on some of the books was parched by the extreme heat.

RICHARDS & CRONKHITE.

Benton, Miss., December 27, 1845.

One of Rich's Improved Salamander Safes, which I purchased on the 2d of June last of A. S. Marvin, 138½ Water street, agent for the manufacturer, was exposed to the most intense heat during the late dreadful conflagration. The store which I occupied, No. 46 Broad street, was entirely consumed; the safe fell from the 2d story, about 15 feet, into the cellar, and remained there 14 hours, and when found, I am told, and from its appearance afterwards, should judge that it had been heated to a red heat. On opening it, the books and papers were found not to have been touched by fire. I deem this ordeal sufficient to confirm fully the reputation that Rich's safe has already obtained for preserving its contents against all hazards.

(Signed,)

WM. BLOODGOOD.

New York, 31st July, 1845.

Reference made to upwards of nine hundred and fifty merchants, cashiers, brokers, and officers of courts and counties, who have Rich's Safe's in use.

The above safes are finished in the neatest manner, and can be made to order at short notice, of any size and pattern, and fitted to contain plate, jewelry, etc. Prices from \$50 to \$500 each. For sale by

A. S. MARVIN, General Agent,  
138½ Water st., N. Y.

Also by Isaac Bridge 76 Magazine street, New Orleans.

Also by Lewis M Hatch, 120 Meeting street  
Charleston, S. C.

16 d

**FRENCH AND BAIRD'S PATENT SPARK ARRESTER.**

TO THOSE INTERESTED IN Railroads, Railroad Directors and Managers are respectfully invited to examine an improved SPARK ARRESTER, recently patented by the undersigned.

Our improved Spark Arresters have been extensively used during the last year on both passenger and freight engines, and have been brought to such a state of perfection that no annoyance from sparks or dust from the chimney of engines on which they are used is experienced.

These Arresters are constructed on an entirely different principle from any heretofore offered to the public. The form is such that a rotary motion is imparted to the heated air, smoke and sparks passing through the chimney, and by the centrifugal force thus acquired by the sparks and dust they are separated from the smoke and steam, and thrown into an outer chamber of the chimney through openings near its top, from whence they fall by their own gravity to the bottom of this chamber; the smoke and steam passing off at the top of the chimney, through a capacious and unobstructed passage, thus arresting the sparks without impairing the power of the engine by diminishing the draught or activity of the fire in the furnace.

These chimneys and arresters are simple, durable and neat in appearance. They are now in use on the following roads, to the managers and other officers of which we are at liberty to refer those who may desire to purchase or obtain further information in regard to their merits:

R. L. Stevens, President Camden and Amboy Railroad Company; Richard Peters, Superintendent Georgia Railroad, Augusta, Ga.; G. A. Nicolls, Superintendent Philadelphia, Reading and Pottsville Railroad, Reading, Pa.; W. E. Morris, President Philadelphia, Germantown and Norristown Railroad Company, Philadelphia; E. B. Dudley, President W. and R. Railroad Company, Wilmington, N. C.; Col. James Gadsden, President S. C. and C. Railroad Company, Charleston, S. C.; W. C. Walker, Agent Vicksburgh and Jackson Railroad, Vicksburgh, Miss.; R. S. Van Rensselaer, Engineer and Sup't Hartford and New Haven Railroad; W. R. McKee, Sup't Lexington and Ohio Railroad, Lexington, Ky.; T. L. Smith, Sup't New Jersey Railroad Trans. Co.; J. Elliott, Sup't Motive Power Philadelphia and Wilmington Railroad, Wilmington, Del.; J. O. Sterns, Sup't Elizabethtown and Somerville Railroad; R. R. Cuyler, President Central Railroad Company, Savannah, Ga.; J. D. Gray, Sup't Macon Railroad, Macon, Ga.; J. H. Cleveland, Sup't Southern Railroad, Monroe, Mich.; M. F. Chittenden, Sup't M. P. Central Railroad, Detroit, Mich.; G. B. Fisk, President Long Island Railroad, Brooklyn.

Orders for these Chimneys and Arresters, addressed to the subscribers, care Messrs. Baldwin & Whitney, of this city or to Hinckley & Drury, Boston, will be promptly executed.

FRENCH & BAIRD.

N. B.—The subscribers will dispose of single rights, or rights for one or more States, on reasonable terms.

Philadelphia, Pa., April 6, 1844.

\*. The letters in the figures refer to the article given in the Journal of June, 1844.

ja45

**PATENT HAMMERED RAILROAD, SHIP**

and Boat Spikes. The Albany Iron and Nail Works have always on hand, of their own manufacture, a large assortment of Railroad, Ship and Boat Spikes, from 2 to 12 inches in length, and of any form of head. From the excellence of the material always used in their manufacture, and their very general use for railroads and other purposes in this country, the manufacturers have no hesitation in warranting them fully equal to the best spikes in market, both as to quality and appearance. All orders addressed to the subscriber at the works, will be promptly executed.

JOHN F. WINSLOW, Agent.

Albany Iron and Nail Works, Troy, N. Y. The above spikes may be had at factory prices, of Frastus Corning & Co., Albany; Hart & Merritt, New York; J. H. Whitney, do.; E. J. Eting, Philadelphia; Wm. E. Coffin & Co. Boston.

**PATENT RAILROAD, SHIP AND BOAT**

Spikes. The Troy Iron and Nail Factory keeps constantly for sale a very extensive assortment of Wrought Spikes and Nails, from 3 to 10 inches, manufactured by the subscriber's Patent Machinery, which after five years' successful operation, and now almost universal use in the United States (as well as England, where the subscriber obtained a patent) are found superior to any ever offered in market.

Railroad companies may be supplied with Spikes having countersink heads suitable to holes in iron rails, to any amount and on short notice. Almost all the railroads now in progress in the United States are fastened with Spikes made at the above named factory—for which purpose they are found invaluable, as their adhesion is more than double any common spikes made by the hammer.

All orders directed to the Agent, Troy, N. York will be punctually attended to.

HENRY BURDEN, Agent.

Spikes are kept for sale, at Factory Prices, by I. & J. Townsend, Albany, and the principal Iron merchants in Albany and Troy; J. I. Brower, 222 Water St., New York; A. M. Jones, Philadelphia; T. Janviers, Baltimore; Degrand & Smith, Boston.

\*. Railroad Companies would do well to forward their orders as early as practicable, as the subscriber is desirous of extending the manufacturing so as to keep pace with the daily increasing demand.

ja45

**MACHINE WORKS OF ROGERS,**

Ketchum & Grosvenor, Paterson, N. J. The undersigned receive orders for the following articles, manufactured by them of the most superior description in every particular. Their works being extensive and the number of hands employed being large, they are enabled to execute both large and small orders with promptness and despatch.

Railroad Work.

Locomotive steam engines and tenders; Driving and other locomotive wheels, axles, springs & flange tires; car wheels of cast iron, from a variety of patterns, and chills; car wheels of cast iron with wrought tires; axles of best American refined iron; springs; boxes and bolts for cars.

Cotton, Wool and Flax Machinery of all descriptions and of the most improved patterns, style and workmanship.

Mill gearing and Millwright work generally; hydraulic and other presses; press screws; callenders; lathes and tools of all kinds; iron and brass castings of all descriptions.

ROGERS, KETCHUM & GROSVENOR,  
Paterson, N. J., or 60 Wall street, N. York.

**DAVENPORT & BRIDGES CONTINUE**

to Manufacture to Order, at their Works, in Cambridgeport, Mass., Passenger and Freight Cars of every description, and of the most improved pattern. They also furnish Snow Ploughs and Chilled Wheels of any pattern and size. Forged Axles, Springs, Boxes and Bolts for Cars at the lowest prices. All orders punctually executed and forwarded to any part of the country.

Our Works are within fifteen minutes ride from State street, Boston—coaches pass every fifteen minutes.

## THE HERRON RAILWAY TRACK,

As seen stripped of the top ballasting

A GOLD MEDAL AWARDED THE INVENTOR BY THE AMERICAN INSTITUTE.

**THE UNDERSIGNED RESPECTFULLY** invites the attention of Engineers, and Railroad Companies, to some highly important improvements he has recently made in the Herron system of the trellis for the purpose of giving an additional, Railway structure. These improvements enable him to effect a very large reduction in the quantity of Timber, and cost of construction, without impairing the strength of the Track, or its powers of resisting frost, while they secure additional features of excellence in the Drainage and facility of making Repairs.

The above cut represents the "Herron Track" as it is laid on the Philadelphia and Reading, and on the Baltimore and Susquehanna Railroads. The intersection of the sills of the trellis are 5 feet from centre to centre, while in the new construction they are only 2½ feet. This renders the string piece unnecessary, thus removing the only objectionable feature found in the Track.

The result of experience has proved that all Tracks constructed with longitudinal timbers, such as mud sills, and more especially, the continuous bearing string pieces retain the rain water that falls between the Rails, which, being thus confined, settles along those timbers, and accumulating in quantity flows rapidly along them on the descending grades, washing out the earth from under the timber, and frequently causing large breaches in the embankments of the road. Whereas all water intercepted by the oblique sills of the trellis, is discharged immediately into the side ditches.

In the 5 foot plan, the Track occupies a Road bed nearly 11 feet wide, while the new construction takes

but 8 feet; the timber being more concentrated under the Rails. A block of hard wood, about 2 feet long and 15 inches wide, is introduced into a square of the trellis for the purpose of giving an additional, and effectual support to the joints of the Rails, which rest upon it. Should these joint blocks become chafed and worn by the working, and imbedding of the chairs, as is now the case on all Railroads, they can be readily replaced without any derangement of the timbers less liable to wear.

The following is a general estimate of its cost near the seaboard. In the interior it will be considerably less.

## ESTIMATE OF THE PROBABLE COST OF ONE MILE.

4,224 Timbers, 11 ft. long, 3 x 6 inches =	
68,696 ft. b.m., at \$10 =	\$686 96
587 Oak joint blocks 2 ft. x 3 x 15 in. =	
4,403 ft. b.m., at \$13 =	57 24
13,000 Spikes = 2,250 lbs. at 4½ cts. =	101 25
Workmanship free of patent charge.....	600 00

Cost of one mile including the laying of the Rail.....\$1,445 45

He has made other important improvements, which will be shown in properly proportioned models, that give a much better idea of the great strength of the Track than a drawing will do.

Sales of the Patent right to all the distant States will be made on liberal terms.

JAMES HERRON.

Civil Engineer and Patentee.

No. 277 South Tenth St., Philadelphia. 331f

## ENGLISH PATENT WIRE ROPES—FOR THE USE OF MINES, RAILWAYS, ETC.—

for sale or imported to order by the subscriber.

These Ropes are manufactured on an entirely different principle from any other, and are now almost exclusively used in the collieries and on the railways in Great Britain, where they are considered to be greatly superior to hempen ones, or iron chains, as regards safety, durability and economy. The plan upon which they are made effectually secures them from corrosion in the interior, as well as the exterior of the rope, and gives a greater compactness and elasticity than is found in any other manufacture.

Many of these ropes have been in constant operation in the different mines in England, and on the Blackwall and other inclined planes, for three and four years, and are still in good condition.

They have been applied to almost every purpose for which hempen ropes have been used—mines, heavy cranes, standing rigging, window cords, lightning conductors, signal halyards, tiller ropes, etc. Reference is made to the annexed statement for the relative strength and size. Testimonials from the most eminent engineers in England can be shown as to their efficiency, and any additional information required respecting the different descriptions and application will be given by

ALFRED L. KEMP,

75 Broad street, New York, sole agent in the United States.

Statement of Trial made at the Woolwich Royal Dock Yard, of the Patent Wire Ropes, as compared with Hempen Ropes and Iron Chains of the same strength.—October, 1841.

WIRE ROPES.			HEMPEN ROPES.			CHAINS.		STRENGTH Tons.
Wire gauge number.	Circumference of rope.	Weight per fathom.	Circumference of rope.	Weight per fathom.		Weight per fathom.	Diameter of iron.	
	INCH.	LBS. OZ.	INCH.	LBS. OZ.		LBS.	INCH.	
11	4½	13 5	10	24 -		50	15-16	20
13	3½	8 3	8½	16 -		27	11-16	13½
14	3½	6 11	7½	13 8		17	9-16	10½

## BOSTON AND MAINE RAILROAD.

Upper Route, to Portland and the East.

### SPRING ARRANGEMENT, March 1, 1847.

### PORTLAND TRAINS.

Leave Boston at 7½ A.M. and 2½ P.M.

Leave Portland at 7½ A.M. and 3 P.M.

### GREAT FALLS TRAIN.

Leave Boston at 4½ P.M.

Leave Great Falls at 6½ A.M.

### HAVERHILL TRAINS.

Leave Boston at 11½ A.M. and 5-50 P.M.

Leave Haverhill at 6½ A.M. and 4 P.M.

### READING TRAINS.

Leave Boston at 9 A.M. and 8 P.M.

Leave Reading at 6½ A.M. and 1½ P.M.

### MEDFORD BRANCH TRAINS.

Leave Boston at 7½, 9 A.M., 2½, 5-50 P.M.

Leave Medford at 6½, 8 A.M., 1½, 5½ P.M.

The Depot in Boston is on Haymarket Square.

Passengers are not allowed to carry Baggage above \$50 in value, and that personal, unless notice is given, and an extra amount paid, at the rate of the price of a Ticket for every \$500 additional value.

CHAS. MINOT, Super't.

## SUMMER ARRANGEMENT.—NEW YORK AND ERIE RAILROAD LINE, from April 1st until further notice, will

run daily (Sundays excepted) between the city of New York and Middletown, Goshen, and intermediate places, as follows:

### FOR PASSENGERS—

Leave New York at 7 A. M. and 4 P. M.

" Middletown at 6½ A. M. and 5½ P. M.

FARE REDUCED TO \$1 25 to Middletown—way in proportion. Breakfast, supper and berths can be had on the steamboat.

### FOR FREIGHT—

Leave New York at 5 P. M.

" Middletown at 12 M.

The names of the consignee and of the station where to be left, must be distinctly marked upon each article shipped. Freight not received after 5 P. M. in New York.

Apply to J. P. Olarkson, agent, at office corner of Duane and West sts. H. C. SEYMOUR, Sup't. March 25th, 1846.

Stages run daily from Middletown, on the arrival of the afternoon train, to Millford, Carbondale, Honesdale, Montrose, Towanda, Owego, and West; also to Monticello, Windsor, Binghamton, Ithaca, etc., etc. Agent on board. 13 u

## NORWICH AND WORCESTER RAILROAD. Summer Arrangement, commencing Monday, April 6, 1846.

Accommodation Trains, daily, except Sunday. Leave Norwich, at 6 a.m., and 4½ p.m. Leave Worcester, at 10 a.m., and 4½ p.m.

The morning Accommodation Trains from Norwich, and from Worcester, connect with the trains of the Boston, and Worcester and Western railroads each way.

The Evening Accommodation Train from Worcester connects with the 1½ p.m. train from Boston. New York Train via Long Island Railroad: Leave Allyn's Point for Boston, about 1 p.m., daily, except Sunday.

Leave Worcester for New York, about 10 a.m., stopping at Webster, Danielsonville, and Norwich.

New York Train via Steamboat—Leave Norwich for Boston, every morning, except Monday, on the arrival of the steamboat from New York, stopping at Norwich and Danielsonville.

Leave Worcester for New York, upon the arrival of the train from Boston, at about 4½ p.m., daily, except Sunday, stopping at Webster, Danielsonville and Norwich.

Freight Trains daily each way, except Sunday.—Special contracts will be made for cargoes, or large quantities of freight, on application to the superintendent.

Fares are Less when paid for Tickets than when paid in the Cars.

32 ly J. W. STOWELL, Sup't.

# TROY RAILROADS.—IMPORTANT NOTICE.

Troy and Greenbush Railroad, forming a continuous track from Boston

to Buffalo and Saratoga Springs. This road is new, and laid with the heaviest iron H rail. Trains will always be run on this road connecting at Greenbush each way with the trains to and from Boston and intermediate places, leaving Greenbush daily at 1 1/2 p.m. and 6 p.m., or on arrival of the trains from Boston; leave Troy at 7 1/2 a.m. and 4 1/2 p.m., or to connect with trains to Boston

Trains also run hourly on this road between Troy and Albany. Running time between Greenbush and Troy, 15 minutes.

## TROY AND SCHENECTADY RAILROAD.

This road is laid its entire length with the heaviest H rail, which is not the fact with the road from Albany. Trains will always be run on this road connecting each way, to and from Buffalo and intermediate places. Leave Troy for Buffalo at 7 1/2 a.m. and 1 p.m. and 6 1/2 p.m., or to connect with the trains for the west; leave Schenectady at 2 1/2 a.m., 8 1/2 a.m., 1 p.m. and 3 1/2 p.m., or on arrival of the trains from Buffalo and intermediate places.

## TROY AND SARATOGA RAILROAD.

### THE ONLY DIRECT ROUTE.

No change of passenger, baggage or other cars on this route. Cars leave Troy for Ballston, Saratoga Springs, Lake George and White Hall at 7 1/2 a.m., (arriving one hour in advance of the train from Albany,) and at 3 1/2 p.m. Returning, leave Saratoga at 9 a.m. and 3 1/2 p.m., (reaching Troy in time for the evening boats to New York.) Cars also leave Troy for the Burrough at 3 1/2 p.m. and 7 p.m., connecting with packet boats for the north. This takes passengers from New York and Boston to Montreal in 44 hours.

N.B. Travellers will find the routes through Troy most convenient and economical, and as expeditious as any other. The steamboats to and from New York land within a few steps of the railroad office, and passengers are taken up and landed by the different railroad lines at the doors of principal hotels, thus saving all necessity for, and annoyance from, hack drivers, cabmen, runners, etc.

Aug. 3, 1846.

# BALTIMORE AND OHIO RAILROAD.

**MAIN STEM.** The Train carrying the Great Western Mail leaves Baltimore every morning at 7 1/2 and Cumberland at 8 o'clock, passing Ellicott's Mills, Frederick, Harpers Ferry, Martinsburgh and Hancock, connecting daily each way with the Washington Trains at the Relay House seven miles from Baltimore, with the Winchester Trains at Harpers Ferry—with the various railroad and steamboat lines between Baltimore and Philadelphia and with the lines of Post Coaches between Cumberland and Wheeling and the fine Steamboats on the Monongahela Slack Water between Brownsville and Pittsburgh. Time of arrival at both Cumberland and Baltimore 5 1/2 P. M. Fare between those points \$7, and 4 cents per mile for less distances. Fare through to Wheeling \$11 and time about 36 hours, to Pittsburgh \$10, and time about 32 hours. Through tickets from Philadelphia to Wheeling \$13, to Pittsburgh \$19. Extra train daily except Sundays from Baltimore to Frederick at 4 P. M., and from Frederick to Baltimore at 8 A. M.

## WASHINGTON BRANCH.

Daily trains at 9 A. M. and 5 P. M. and 12 at night from Baltimore and at 6 A. M. and 5 1/2 P. M. from Washington, connecting daily with the lines North, South and West, at Baltimore, Washington and the Relay house. Fare \$1 60 through between Baltimore and Washington, in either direction, 4 cents per mile for intermediate distances. s13y1

## MANUFACTURE OF PATENT WIRE

Rope and Cables for Inclined Planes, Standing Ship Rigging, Mines, Cranes, Tillers etc., by JOHN A. ROEBLING, Civil Engineer, Pittsburgh, Pa.

These Ropes are in successful operation on the planes of the Portage Railroad in Pennsylvania, on the Public Slips, on Ferries and in Mines. The first rope put upon Plane No. 3, Portage Railroad, has now run 4 seasons, and is still in good condition.

# NEW RAILROAD ROUTE FROM BUFFALO TO CINCINNATI.

Passengers destined for

Columbus and Cincinnati,

St. Louis, Ky., St. Louis, Mo., Memphis, Tenn., Vicksburg, Natchez, New Orleans, and all intermediate ports, will find a new, and the most expeditious and comfortable Route, by taking Steamboats at Buffalo, landing at Sandusky City, Ohio, distance 230 miles.

From thence by Cars, over the Mansfield Railroad which is new and just opened [laid with heavy iron,] to Mansfield, distance 56 " Thence by Stage via Columbus to Xenia over gravel and Macadamized Road, (the best in the state,) in new coaches, distance 88 " Thence, over the Little Miami Railroad, from Xenia to Cincinnati, distance 65 "

TIME.

From Buffalo to Sandusky 24 hours.

Leave Sandusky 5 a.m. to Columbus 14 "

From Columbus to Cincinnati 15 "

Or say 30 hours from Sandusky to Cincinnati over this route, including delays.

FARE.

From Buffalo to Sandusky, Cabin \$6 00

" " " Steerage 3 00

" Sandusky to Columbus 4 50

" " through to Cincinnati 8 00

Passengers should not omit to pay their fare through from Sandusky City to Cincinnati and take receipts availing themselves of the benefit of a contract existing between the said Railroad and Stage Co's, securing 121 miles travel by good Railroad and 88 miles by Stage, in crossing from Lake Erie to the Ohio river, in the space of 3 1/2 hours.

Passengers destined for St. Louis, or any point below on the Mississippi, will save by taking this route, from 4 to 6 days time and travel, and nearly half the expense, over the Chicago and Peoria route to the above places.

Fare by this route, although the cheapest, will in a short time be reduced, Railroad lengthened, and speed increased.

B. HIGGINSON, Sup't, etc.

M. & S. C. R. R. Co.

Sandusky City, Ohio.

# NEW YORK & HARLEM RAILROAD CO.—Winter Arrangement.

On and after Monday, November 23, 1846, the cars will run as follows:

Leave 27th street for 43d street, Deaf and Dumb Institute, Yorkville, Harlem Morrianna, and Williams' Bridge, at 7 o'clock a.m. From City Hall for above named places, 2 p.m. [freight train,] 2 30 p.m. 5 p.m. to Morrisania only.

Leave City Hall for Harlem, Morrisania, Fordham and Williams' Bridge, at 7 45 a.m., and 10 45 a.m.; 1 15 p.m., 2 p.m. [freight train,] 2 30 p.m. and 3 45 p.m.

Leave City Hall for Hunt's Bridge, Bronx, Tuckahoe, Hart's Corners White Plains, Davis' Brook, Unionville and Pleasantville, [Pleasantville 4 miles from Sing Sing,] 7 45 and 10 45 a.m.; 1 15 p.m., 2 p.m. [freight train,] and 3 45 p.m.

## RETURNING.

Leave Pleasantville, at 8, 10, [freight train,] and 11, a.m.; 1 30, and 4, p.m.

Leave White Plains, at 8 12, 10 30, [freight train] and 11 20 a.m.; 1 50, and 4 20, p.m.

Leave Tuckahoe, 8 35, 10 55, [freight train,] and 11 35, a.m.; 2 05, and 4 35, p.m.

Leave Williams' Bridge at 7 45, 8 50 and 11 50 a.m.; 2 10, 4, and 4 50 p.m.

Leave Morrisania 8 and 9 05 a.m.; 12 05, 2 35, 4 20, 5 05 and 6 p.m.

Leave Yorkville, at 8 12 a.m.; 4 35 and 6 15 p.m.

## SUNDAY ARRANGEMENTS.

Leave City Hall for Pleasantville and intermediate places, at 7 45 a.m.; 1 15 and 3 p.m.

Leave Pleasantville for City Hall, at 8 a.m.; 11, and 3 15 p.m.

Leave City Hall for Williams' Bridge and intermediate places, 10 45 a.m.; 2 30 p.m.

Leave Williams' Bridge for City Hall, at 8 50 and 11 50 a.m.; 1, 2 45 and 4 05 p.m.

# BALTIMORE AND SUSQUEHANNA RAILROAD.—Reduction of Fare.

Morning and

Afternoon Trains between Balt-

imore and York.—The Passenger

trains run daily, except Sunday, as follows:

Leaves Baltimore at 9 a.m. and 3 1/2 p.m.

Arrives at 9 a.m. and 6 1/2 p.m.

Leaves York at 5 a.m. and 3 p.m.

Arrives at 12 1/2 p.m. and 8 p.m.

Leaves York for Columbia at 1 1/2 p.m. and 8 a.m.

Leaves Columbia for York at 8 a.m. and 2 p.m.

## FARE.

Fare to York \$1 50

" Wrightsville 2 00

" Columbia 2 12 1/2

Way points in proportion.

PITTSBURG, GETTYSBURG AND

HARRISBURG.

Through tickets to Harrisburg via stage to Har-

risburg \$9

Or via Lancaster by railroad 10

Through tickets to Harrisburg or Gettysburg 3

In connection with the afternoon train at 3 1/2 o'clock,

a horse car is run to Green Spring and Owing's

Mill, arriving at the Mills at 5 1/2 p.m.

Returning, leaves Owing's Mills at 7 a.m.

# THE BEST RAILROAD ROUTE TO THE

Lake and Buffalo, from Cincinnati.

Take Cars to Xenia, 65

miles; take Stage to Mans-

field, 88 miles; thence by Cars to Sandusky, 56

miles to the Lake; thence Steamboat to Buffalo, 230

miles.

Fare from Cincinnati to Sandusky \$8 00

" " Sandusky to Buffalo, Cabin 6 00

" " " Steerage 4 50

Fare by this route, although the cheapest across

the state, will be reduced in a short time, railroad

lengthened, and speed increased.

Leave Cincinnati in the morning, arrive at Co-

lumbus at night.

Leave Columbus in the morning, arrive at San-

dusky same day.

Leave Sandusky, by Boat, in the morning, arrive

at Buffalo next morning in time for the Cars north

and east for Niagara Falls, Canada, Saratoga

Springs, Troy, Albany, Boston, New York, Wash-

ington, or Philadelphia.

Passengers should not omit to pay their fare

through from Cincinnati to Sandusky, or from Co-

lumbus to Sandusky via Mansfield; as this route is

the only one that secures 56 miles [this road is run

over in 2h. 50m.] most railroad which is new, and

is the shortest, cheapest and most expeditious across

the state.

Fares on the New York railroads are about to be

reduced. B. HIGGINS, Sup't, etc.

The works being on an extensive scale, all orders will be executed with promptness and despatch. Communications addressed to Mr. William H. Dobbs, Superintendent, will meet with immediate attention.

ANDREW C. GRAY,  
a45 President of the Newcastle Manuf. Co.

**R**AILROAD IRON AND LOCOMOTIVE

Tyres imported to order and constantly on hand by A. & G. RALSTON  
Mar. 20th 4 South Front St., Philadelphia.

**V**ALUABLE PROPERTY ON THE MILL Dam For Sale. A lot of land on Gravelly Point, so called, on the Mill Dam, in Roxbury, fronting on and east of Parker street, containing 68,497 square feet, with the following buildings thereon standing.

Main brick building, 120 feet long, by 46 ft wide, two stories high. A machine shop, 47x43 feet, with large engine, face, screw, and other lathes, suitable to do any kind of work.

Pattern shop, 35x32 ft. with lathes, work benches, Work shop, 86x35 feet, on the same floor with the pattern shop.

Forge shop, 118 feet long by 44 feet wide on the ground floor, with two large water wheels, each 16 feet long, 9 ft diameter, with all the gearing, shafts, drums, pulleys, &c., large and small trip hammers, turnaces, forges, rolling mill, with large balance wheel and a large blowing apparatus for the foundry.

Foundry, at end of main brick building, 60x45½ feet two stories high, with a shed part 45½x20 feet, containing a large air furnace, cupola, crane and corn oven.

Store house—a range of buildings for storage, etc., 200 feet long by 20 wide.

Locomotive shop, adjoining main building, fronting on Parker street, 54x25 feet.

Also—A lot of land on the canal, west side of Parker st., containing 6000 feet, with the following buildings thereon standing:

Boiler house 50 feet long by 30 feet wide, two stories.

Blacksmith shop, 49 feet long by 20 feet wide.

For terms, apply to HENRY ANDREWS, 48 State st., or to CURTIS, LEAVENS & CO., 106 State st., Boston, or to A. & G. RALSTON & Co., Philadelphia. ja45

**T**O RAILROAD COMPANIES AND BUILDERS OF MARINE AND LOCOMOTIVE ENGINES AND BOILERS.

PASCAL IRON WORKS.

**WELDED WROUGHT IRON TUBES**

From 4 inches to 1 in calibre and 2 to 12 feet long, capable of sustaining pressure from 400 to 2500 lbs. per square inch, with Stop Cocks, T, L, and other fixtures to suit, fitting together, with screw joints, suitable for STEAM, WATER, GAS, and for LOCOMOTIVE and other STEAM BOILER FLUES.

Manufactured and for sale by

MORRIS, TASKER & MORRIS.

Warehouse S. E. Corner of Third & Walnut Streets,

PHILADELPHIA.

**T**O LOCOMOTIVE AND MARINE ENGINE BOILER BUILDERS. Pascal Iron Works,

Philadelphia. Welded Wrought Iron Flues, suitable for Locomotives, Marine and other Steam Engine Boilers, from 2 to 5 inches in diameter. Also, Pipes for Gas, Steam and other purposes; extra strong Tube for Hydraulic Presses; Hollow Pistons for Pumps of Steam Engines, etc. Manufacture: and for sale by

MORRIS TASKER & MORRIS,

Warehouse S. E. corner 3d and Walnut Sts., Philadelphia. 11f

**P**ATENT INDESTRUCTIBLE WATER

Pipes. The subscribers continue to manufacture the above Pipes, of all the sizes and strength required for City or Country use, and would invite individuals or companies to examine its merits. This pipe, unlike cast iron and lead, imparts neither color, oxide or taste, being formed of strongly riveted sheet iron, and evenly lined on the inside with hydraulic cement. While in the process of laying, it has a thick covering externally of the same—thus forming nature's own conduit of stone. The iron being thoroughly enclosed on both sides with cement, precludes the possibility of rust or decay, and renders the pipe truly indestructible. The prices are less than those of iron or lead. We also manufacture Basins and D. Traps, for Water Closets, on a new principle, which we wish the public to examine at 112 Fulton street, New York.

J. BALL & CO.

## Items from late English Papers.

We are principally indebted to the *London Mining Journal*, of January 9th, for the following items of intelligence, from abroad.

**Lancaster and Carlisle Railway Works.**

—At the banquet by Messrs. Stephenson, Brassey, and Mackenzie, the contractors, in celebration of the opening of the Lancaster and Carlisle, the following facts were stated in a speech from Mr. Mould, the contractors' superintendent. In the blasting of rocks, no less than 4800 barrels, or 200 tons, of gunpowder had been used. The patent fuses alone, if put on a line, would reach 400 miles. The number of nights during which the men worked was 152,147. The number of horses employed was 10,500. No fewer than 400,000 yards required blasting, as it could not be removed by any other means. The number of bridges on the line was 219; of culverts, 230; and of viaducts 500. The greatest number of men employed was about 10,000, and the number of workmen altogether was equal to 3,000,000 in one day—while the excavations averaged 100,000 cubic yards per mile. The number of wagons employed was 2200, which, if extended in a line, would reach nearly five miles; and the temporary wheeling planks, placed end to end, would extend to 35 miles.

**Consumption of Smoke.**—Mr. T. M. Dean of Stockport, has obtained letters patent for an improvement in the construction of furnaces of steam engines and other boilers, by which the combustible vapors are consumed, and fuel economised. It consists in dividing the furnace between the fire doors and bridge into two parts by a partition wall; for feeding each of which with, there is a double feeding apparatus attached, worked by the engine in such manner, that when one side of the furnace is being fed, the damper on that side is closed, and the body of dense smoke passing over the incandescent fuel on the other side is consumed, and vice versa. The machinery for effecting the necessary movements in simple and complete, but cannot be described without a diagram.

**Application for Charters.**—The following is the result of all the private bills for railways, canals, etc., deposited in the Private Bill Office, for the consideration of Parliament, with the amounts of estimated expenses, namely: railways, £90,789,274; canals, 297,950; water works, £1,063,631; docks, £2,996,683; pier and harbors, £263,031; bridges, £13,000; roads, 13,140; miscellaneous, £180,358; total, £95,740,067. The capital stock of these schemes is £82,100,970, and they are authorized to borrow the sum of £33,472,794.

**Important Experiment.**—An interesting and very important experiment was made this week, at the Prior Field Iron Works, belonging to Mr. H. B. Whitehouse, on some cast iron girders intended for the steam factory buildings at Portsmouth, now in the course of erection. The experiment was made under the direction of Captain James, of the Royal Engineers, on the part of the Admiralty, and in the presence of Mr. Peter Rolls, contractor for the works at Portsmouth, Mr.

Henry Smith, of West Bromwich, and several other gentlemen; and nothing could be more satisfactory than the result—as the girders did not break till they had sustained the weight of 30½ tons over the weight which the strength of the girders, computed by Hodgkinson's rules, was calculated to break with. The mass of iron distributed over these girders exceeded 7 feet in height, and showed that the castings were capable of sustaining a very much larger weight than they could ever be loaded with in the factory for which they are intended.—*Aris' Birmingham Gazette*.

**Steam Superseded.**—Sir John Rennie, in his able annual address, says—"The steam engine itself, improved as it is, and wonderful as has been the results produced by it, is capable of further improvements. Its bulk and weight may be further diminished, both in the form and construction of the boiler as well as the engine itself, and thus in effect, its power may be increased; or it may be reserved to us to discover the means of producing, and rendering subservient to our purposes, some other power which shall surpass steam, or, perhaps, to substitute for it that all-powerful agent, electricity, which Jacobi has already attempted to apply to navigation.—Obscure and difficult as the subject may appear now, it may still be realized. Our indefatigable and enlightened honorary member, Faraday, has pointed out the way, and is still proceeding in his distinguished career with remarkable success, and we must not lose the opportunity of profiting by it: in fact, by well directed and combined exertions, it is impossible to foresee the results which may yet be arrived at."—*Sir J. Rennie's Address*.

**Railways.**—The present week commenced by the railway share market being very flat; notwithstanding which, some of the old lines advanced a little. Tuesday and Wednesday business remained excessively dull, and with a marked tendency to further decline in the majority of new lines; the country orders, which came in so freely last week, have suddenly ceased; and the dullness may, in a great measure, be attributed to that circumstance. An evident improvement took place on Thursday; prices rallied, and were pretty well maintained, and the market closed yesterday without any particular relapse towards its former dullness.

**Iron Steamers.**—The following provisions in the Steam Navigation Act of last session, which came into operation on Friday last, has reference to iron steamers. Section 2. "And be it enacted, that all steam vessels built of iron, of 100 tons burden, the building of which shall have been commenced after the passing of this Act, shall be divided by transverse water tight partitions, so that the fore part of the vessel shall be separated from the engine room by one of such partitions." The Act was passed on 28th August.

—You will not have forgotten the quotation made in a preceding letter from *Le Siecle*, relative to the demand made by the Northern railway company, to be allowed to import rails from England on paying a somewhat smaller duty than that fixed in the tariff. The

*Siecle* of this day announces that this demand, after being taken into consideration by the government, has been rejected.

**Railway Traffic Returns.**—From these returns, it will be seen, that the amount of traffic for the last week, on nearly 2730 miles of railway, was £142,627, thus accounted for: £77,385 for the conveyance of passengers only, £33,919 for the carriage of goods, and a remainder of £31,323 for passengers and goods together, not respectively apportioned; being an increase over the corresponding week of last year of £19,386.

**London and York Railway.**—The works on this line are proceeding with the utmost rapidity. Nearly the whole of the land is in the possession of the company, and surveyors are engaged on the entire length of the line, staking out, etc.

**French Railways.**—No tender has been made to the Minister of Public Works for undertaking the St. Dizier and Gray railroad, consequently the execution of the works remains in the hands of the government.

**Railway Speed.**—The government inspector, Capt. Coddington, travelled by the Great Western on Monday, at the rate of *seventy-two miles an hour!*

## Foreign Extracts.

**Atmospheric Railways.**—The atmospheric system has been the subject of much discussion here and elsewhere. It was first proposed in 1824, by Vallance, of Brighton, where a working model was constructed of sufficient dimensions for the carriages to be introduced at one end of a tunnel; and the air being exhausted by a steam engine at the other, they were propelled forward by the pressure of the atmosphere. It was even proposed to adopt the system for the speedy transmission of letters; the system, however, was necessarily so imperfect, that except for the ingenuity of the idea, it was of no practical utility. It was afterwards improved by Medhurst, in 1827, and was brought forward by Pinkus, in a more complete form, in 1834, by making the carriages travel outside the tube; and in 1839 it was further improved and patented by Clegg; since that period it has been brought into operation by Clegg & Samuda, who tried an experiment upon a working scale in 1840, for about a mile in length, at Wormwood Scrubbs. This experiment showed that a load of six tons could be propelled at a velocity of 30 miles an hour with an atmospheric tube only nine inches in diameter, and induced the leading proprietors of the Dublin and Kingstown railway to adapt it, for extending that line to Dalkey, a distance of 1 3/4 mile, where the country was difficult, and not well adapted for locomotives. That extension was opened in the latter end of 1843, and has continued working ever since. The line is single; the rails, though rather lighter, are laid upon the ordinary plan; and in the centre between them there is a tube about 15 in. diameter, having a slit or opening at the top, which is closed by an elastic valve; a piston fitted to the foremost carriage of the train, is inserted into the tube which is connected at the upper end with an air pump, worked by a steam engine, which

exhausts the air from the tube, and the piston attached to the foremost carriage is then urged along the tube by the pressure of the atmosphere, and draws the train with a velocity in proportion to the perfection of the vacuum in the tube; as fast as the piston advances, the valve in the slit of the tube is opened, and is closed again after the piston has passed, and is rendered tight and impervious to air by a composition of fatty matter placed in the groove into which the edge of the valve falls. The planes of this line are extremely steep, being in some places 1 in 50 and the curves are very sharp. The highest vacuum obtained has been 26 inches, with a speed of 35 miles an hour. The train returns from Dalkey by gravity alone. For a first experiment, it has been tolerably successful. The system is being tried upon a larger scale upon the Croydon and the South Devon railways; a portion of the former has been opened, and a speed of 60 miles an hour has been obtained, with a vacuum in the tube of 27 in.; and a train consisting of ten carriages, weighing 50 tons, has been propelled 5 miles in 8 1/4 minutes, or at the rate of 35 miles an hour, the barometer indicating a vacuum of 25 to 28 in. The engines are 3 miles apart, and a power of 300 horses is employed for the whole distance. The tube is 15 inches in diameter, and the air pump 6 feet 3 inches diameter; the steepest plane is 1 in 50. The South Devon line has not yet been tried. Considering the recent introduction of this system, and the new contrivances required in all its details, much has been done—with further experience, it is not improbable much more will be effected. Pilbrow, in 1844, patented a modification of the system, which is ingenious, but has not yet been sufficiently tested to prove its merit. Halls proposed to improve the valve on the top of the atmospheric pipe, by means of two small inflated elastic tubes, fixed in grooves on each side of the opening on the top of the pipe, through which the rod attached to the piston should slide between the tubes, and which should close the orifice as the piston moved. This ingenious idea requires the test of experience.—*Rennie.*

**New Railway System in France.**—The new railway opened in June last, from Paris to Sceaux, and constructed on the principle of a series of curves of small radii, has created a great deal of interest, as establishing a new theory in railway locomotion, and breaking down the barriers of prejudice, which obstinacy and ignorance had reared around this new national system. The distance from Paris to Sceaux is about 6 1/2 English miles; and in this distance the line traverses curves in all directions, of 150, 50, and even 30 metres radius; sometimes a straight line for a short distance precedes or succeeds a curve, and at others a curve succeeds another, but in a contrary direction, and gradients of all kinds are met with in the distance, the line much resembling a zig-zag sheep walk up a hill side. The train thus resembles a gigantic serpent, twisting and twining in all directions as it passes over the yellow sand: but no accident, no running

off the rails, is feared as the result. M. Arnoux, the inventor of the system, has long turned his attention to the inconvenience and danger of perfectly ridged axles, and the wheels running with them, and the construction of the wheels and axles is the principal point in the system; the construction of the beds of the carriages will differ very little from those of ordinary carriages. Each axle is pierced in the centre with a main iron bolt on which it can turn horizontally, while the wheels mounted on patent cylindrical boxes have free play on the journals. The fore and hind wheels of the different carriages in succession are united by a carriage beam, which is pierced by the main bolts which hold the axles, and which support two transoms, on which the beams are placed. The fore axles of the first coach receive its direction from the road itself; to effect which, two irons, each having two prongs, are attached to the centre of the front axle; these prongs descend to the rails on both sides, and carry a small wheel which, touching the rail, gives to the axle the right direction to the road. The carriages are also united by cross chains to carry the first impulse given throughout the train, and there are some minor details which are not of importance to describe. The appearances at each termini are singular; the station is oval, and the trains are ranged in a curve, with the coaches standing on the same rail, at nearly right angles with each other; while all the axles converge as radii, to a point in the centre, where stands a flag staff. Here are no multiplicity of rails, no switches, needles, turntables, etc. The train comes on at one side of the oval, on a single pair of rails, waits till another train comes in, when it gracefully performs the circuit, passing off at the other side of the oval, and on to the same line again. The fares are—saloons 10d., first class 7d., second 5d. and third class 3d. The average speed is, perhaps, 25 minutes for the distance, which considering the nature of the road, and the number of stations, is sufficiently fast for the length; but express trains, without one stoppage, have gone at the rate of 37 miles an hour. M. Arago, one of a commission appointed by government to investigate the new system, has reported thereon; in which he remarks, that it would not impose an increase of expense for traction; that with respect to safety the most timid ought to be satisfied; that railways may henceforth be constructed at much less expense; and that the name of M. Arnoux will be most honorably placed by the side of others, who, by their inventions, have rendered great service to railways.

**Goddard's Improved Anemometer.**—The increasing attention which men of science are giving to the study of atmospheric influences, has induced many attempts at improving the anemometer; and the advantages which Mr. Goddard claims are, that the scale of time is five times larger than those in use within equal sized sheets, the register of direction is more accurate, an equal quantity of paper being used, and it can never fail to register; the data also are more comprehensive. It consists of a double vane, shaped

like a truncated cone, the small ends being secured to a vertical brass tube, passing through the roof of the building, and resting at its lower end in a socket, fixed on a table; to the lower end of this shaft is a cylinder, which rests on the table, and follows every movement of the shaft, its upper face cut obliquely; the points of the compass being marked around its periphery. At a short distance is fixed an upright drum, which turns upon its axis, and is acted upon by wheels and an endless screw in such manner that it always turns with the vane. Between the vane, shaft and drum, a vertical guide is fixed firmly on the table for the purpose of carrying three pencils, one under the other. To the top pencil, an arm, pendant from one end of a vibrating lever, is attached; this lever is supported by a bracket from the table; and, at its other end, it is connected by a pendant arm, with the minute hand of a clock, and which thus marks the time on the drum, while the oblique faced cylinder marks the point from which the wind blows, the upper point of the oblique circle being north, the lowest point south, and two intermediate points east and west. It is thus evident that, by drawing vertical lines on the paper round the drum, the movements of the wind at any given time may be clearly traced.

**Improvements in the Steam Engine by Dr. Haycraft.**—The intention of Dr. Haycraft's improvements in the steam engine is to save fuel, by the use of what he calls anhydrous, or perfectly dry steam. He has found that three conditions are necessary completely to effect this object; first, that the steam should be separated from the water of ebullition, or priming, before leaving the boiler; secondly, that it should pass through a tube, or tubes, surrounded by steam of a somewhat higher temperature, which the inventor calls a siccator; and, thirdly, that the working cylinder be also surrounded by steam of a somewhat elevated temperature. The two last conditions are easily effected by throttling the steam before it enters the siccator which supplies the engine. A low pressure engine which drives a flour mill has been altered on this principle, and it has been ascertained that the consumption has been diminished from seven to four pounds for each bushel of flour ground. As, however, the adaptation of these three particulars is attended with considerable expense, the inventor has been induced to try the effect of using only what he calls a priming chest, which fulfils the first condition, viz: that of separating the steam from the priming. This apparatus has been introduced into the *Lady of the Lake*, one of the Iron Steamboat Company's vessels, with a tubular boiler, and the machinery by Penn. It produces a saving, as ascertained by the difference of temperature of the hot well, of one-sixth, with an increase of speed. The engines work more steadily, and the boiler is not required to be blown out but once weekly, instead of thrice. The inventor supposes the priming chest to be especially adapted for locomotives for the prevention of priming; he considers that priming takes place in an insensible manner in all boilers, even in those cases in which

there is no ordinary evidence of it. The principle on which the steam is separated in Hayercraft's priming chest, consists in causing the steam to reverberate several times in an apparatus similar to what is used in purifying gas, while the water separated is drained off by pipes. He has given 14 different forms in which it may be constructed, one of which somewhat resembles Seward's separator.

**Effects of Shot on Iron Vessels, Kamptulicon.**—In a recent number of the Mining Journal, we inserted a letter from a correspondent, "J. H. S." (Newcastle-upon-Tyne) on this subject; and although we cannot furnish the data required by him as to size of angle iron, thickness of plates, etc., we can state that Lieut. G. Walter, R.M., inventor of the kamptulicon, is still pursuing his experiments at Woolwich Dockyard, by order of the Lords of the Admiralty, on this important subject. Among other trials, he is now ascertaining whether this composition of caoutchouc and cork will answer as a medium for causing the adhesion of copper sheathing to the bottoms of vessels built of iron, without nails of any kind. A part, or model, of one side of the stern of an iron-built vessel, has been constructed in the part of this factory where the tubular boilers are proved, and a layer of the kamptulicon composition, of the thickness of felt, applied on the outside, to prevent the contact of the copper with the iron, which would soon, by its action destroy the latter. The kamptulicon composition causes the copper sheathing to adhere to the iron hull of the model very tenaciously; and, if the thickness is found sufficient to prevent the action of the copper on the iron, a great advantage will be gained. The idea of protecting the iron ships *outside* by the kamptulicon coppering, and their crews *inside*, from the effect of cannon shot, by a lining of this elastic substance, which catches the splinters and closes over the holes, even against the pressure of water, will render the ships of our iron navy the most perfect in the world. With respect to the kamptulicon coppering, we have no doubt, from the totally impervious nature of the material, and its resistance to any acids which could come in contact with it in such situation, that it will be found entirely to prevent any galvanic action between the copper and iron. We expect, however, in a few weeks the above experiments will be conclusive on the subject—the results of which we shall lay before our readers.

#### Railroads in England.

A recent number of the Edinburgh Review contains a lengthy article on the subject of railroads throughout the world, in which are gathered together a vast number of interesting facts on this important subject. To make even a synopsis of the whole article, would cause us to transcend our limits; and we confine ourselves to a detail of what it relates concerning railroads in the British empire.

The Liverpool and Manchester Railroad was the first built in England, and was at first only intended to transport merchandize, because of the dilatoriness of the canal navigation between the two cities, it taking twice as long for cotton to reach Manchester from Liverpool, as it did to reach Liverpool from

New York! and the charges were enormous at that. When this road was in course of building, and it had been resolved to make use of the locomotive engine thereon, Mr. Stephenson, the celebrated engineer, diffidently suggested that twelve miles an hour might be accomplished by its use; but the idea was scouted by the "knowing ones," as the blockheads of the world style themselves, one of them even publishing a work for the purpose of proving that he shared not in Mr. Mr. S.'s insanity! He did that for himself, which Dogberry was so anxious that some one should do for him—wrote himself down an ass; for in a few months after, an engine went over that road at the rate of 29 miles an hour! It was soon proved, that more money was to be made by carrying passengers than merchandize, especially as the canals had peculiar facilities, if they but choose to exert them, for doing the latter: and though the freight sent over the road amounted to 1000 tons per day, it fell short of the expectations of the projectors of the enterprize. But travel increased three-fold at once, and heavy dividends were the immediate result, and the shares were taken at a premium of 120 per cent. This road was opened in 1825, and its success led to the immediate building of others, so that by June 30, 1845, the number of miles of opened railroad in England, was 2,118 1-4; and parliament had sanctioned the construction of eighteen hundred additional miles. The average cost of the construction of railroads in England, was £35,000 per mile, those on the wide gauge plan costing £40,000. This enormous cost has its cause, principally in the superior manner in which the English railways are constructed, the "way and works" actually absorbing £22,000 per mile of the cost. Land cost £4000 per mile; locomotive power and working stock, £8000; and office and sundries, £1000. Total receipts on the several roads, for the year, ending June 30, 1846, was £6,309,714, of which the sum of £3,976,341 was from passengers, and that of £2,333,373 from freight. The amount of increase on freight was greater annually than that on passengers, and the average total, for the year 1845, excluding fractions, was £3000 per mile. It is estimated that 42 per cent. of the revenue, is sunk in expenditures, leaving 58 per cent., or £1740 per mile, as the profit on £35,000, being at the average rate of five per cent. "Thus it appears," says the reviewer, "that, although several great enterprizes give ten per cent., the general average profits on these speculations does not amount to more than the ordinary profit engaged in large commercial investments. Many unsuccessful lines pay little or no interest on the capital sunk, and, indeed, some yield dividends of comparatively small amount; and thus the larger dividends of the more successful lines are neutralized." Is not this pretty much what has been the result in the United States? The per centage of the revenue from passengers in England, is 63; from freight, 37. It appears that the "way travel" is much more profitable than the terminal travel, 80 per cent., of the passengers

not going over twelve miles each. This is contrary to what is generally supposed to be the case, most people thinking that the income from travel is derived from persons going from one end of the line to the other. "It is clear," as the Edinburgh says, "that terminal populations have but little connection with the financial success of railway projects. The main support is short traffic." There are three classes of cars on the English lines, the travel in which is distributed as follows: First class, 16 1-2 per cent; second class, 43 1-2; third class, 40. To each £100 of revenue, the different classes contribute at the following rates: First class, £40 14s.; second class, £42 16s.; third class, £16 10s. The reason why the third class is so unproductive, when it should yield by far the most proportionate revenue, is because there are four disturbing causes to prevent such a state of things, namely, high (comparative) fares, unsale and uncomfortable carriages; inconvenient hours, and slow travelling. The number of passengers carried over the English roads, for the year ending June 30th, 1845, was 33,791,253. The locomotive engines employed in drawing passenger trains alone, performed, that year, the work of 50,000 stage coach horses. The saving of money to travellers, was but a trifle under \$7,000,000, that being the difference between the fare charged on the railroads and what would have been paid for stage coach travelling.

There has, as most people are aware, been a great railroad mania in England. During the height of it, parliament sanctioned the building of lines which, if completed, will make the whole number of miles of railroad in England 9300! Four thousand miles of railroad were authorized at the last session of parliament, which it will take the sum of £150,000,000 to complete, exclusive of loans, £50,000,000 will be required in addition to complete the lines previously authorized; so that England will have, when all these undertakings shall have been completed, and including the lines that have long been in operation, about one thousand three hundred millions of dollars invested in railroads! It is extremely doubtful, however, whether the various undertakings can all be completed, at least, for many years; but if all these roads should be constructed, say in five years, the pressure on the money market must be heavy indeed, and a monetary revolution will take place. All business operations will be affected, and labor seriously suffer. Nor will England alone be the sufferer. That country is the heart of the business world, and when the heart suffers, every part of the system must sympathize with it. We shall have our share of suffering, in consequence of the delusion on the subject of railroads in England. Even if the several schemes should all be successfully carried out without producing any immediate disastrous results, it is by no means probable that all the new lines will be profitable, and hence large amounts of capital will be sunk, which cannot fail to operate injuriously on trade. The subject is one of moment, and cannot fail to

excite more attention than it has hitherto received in this country, between which and England an indirect alliance is forming itself, founded on benefits received and benefits conferred by each party.

#### The Iron Trade.

We find in the Liverpool Albion of January 7 and 11th, the following extracts from the circulars of two or three extensive iron houses in England—and tho' we have referred before to the subject generally, since the arrival of the last steamer, we have no doubt the annexed extracts will be found interesting to iron dealers in this country.

From Messrs. Martin & Co's. Circular, Glasgow.

"Allow us to offer you one or two short remarks on the Scotch iron trade of last year.

"At the end of 1845, our closest scrutiny made the stock 220,000 tons; at the end of August last, 130,000; now, at the end of December, fully 140,000. The increase, being chiefly in December, still goes on.

"We consider the very current estimate of the make for 1846, 520,000 tons, to be a fair approximation.

"The supply of 1845 shows thus:

Stock.....	220,000
Make.....	520,000—740,000 tons.
Deducting the present stock..	140,000 "

The shipments and consumption appear to have been 600,000 tons.

"We hold it useless to attempt classifying the items of consumption, any statements that are tried being of necessity arbitrary. It is accurately ascertained that the quantity sent off by the canal and Clyde was 313,000 tons, but this includes supplies to several large foundries near the canal. At the end of 1845 the furnaces in blast were 88, at the end of June last, 94, and are now 100, (including 2 new ones at Eglenton, and one at Glen garnock.)

"We are not only led to look at 100 as a minimum during 1847, but as a third will blow at Eglenton in a few days, and elsewhere one or two repairing are said by the owners to be on the point of blowing, we are induced to think the make in 1847 will not fall short of 600,000 tons, on the very usual assumption of 110 tons weekly average per furnace; these recent additions strengthening our opinion that a few more furnaces will blow by degrees.

"Between stock and make we look for a supply in 1847 quite equal to 1846. As to the probable demand on it, opinion will be various.

"The exports were, in October, 26,000 tons, in November, 21,000 tons, and in December, 17,000 tons."

From Messrs. J. Watt, Son & Co's. Circular, Jan. 4.

"On reference to the prices of iron during the past twelve months, you will observe that we have experienced very little fluctuation indeed. During the whole of the year the demand has been quite equal to the supply; and the manufacturers have exercised great prudence in resisting attempts to raise prices to an excessive degree, apprehending very justly, that the temporary advantage gained thereby would be no equivalent for the ultimate injury which might result from such a

step. In consequence of the demand for labor upon railways and other public works, and the difficulties which the iron master has always to contend with in the management of his workmen in times when wages are high, there has been very little increase to the make during the year. In fact, in some districts great difficulty is experienced in keeping the old works fully going, from want of coal, etc.

"This state of things is likely to continue, and when, along with it, we take into account the certain demand for iron which there will be for a length of time, we are led to the conviction that the same steadiness will last throughout the year upon which we have just entered.

"Manufactured iron has varied little in price throughout the year, with the exception of railway bars, which were driven above their relative value by extensive speculation; the price, which, in January last, was as high as £11 10s., has declined to £9 15s., to £10 per ton, at which rates very extensive contracts have recently been entered into, and below which it is probable purchases will be made throughout the year. The number of railways already forming, and their rapid extension in this and other countries, are a sufficient guarantee for such a demand for years to come, for iron required in their construction, as will secure to the trade a high state of prosperity. On account of the greater profit attending the manufacture of railway bars, much of the mill power formerly employed in the production of merchant bars, and other descriptions of iron, has been directed to the former, and, in consequence, the make of the latter kinds of iron, has been curtailed a considerable extent. This remark applies especially to Welsh bar iron, the stocks of which are exhausted both in the hands of dealers and makers, and will be difficult to obtain, without an advance in price in quantity sufficient to meet the spring demand. An advance, from £8 10s. to £9 per ton, in Wales, has already taken place, which has compelled the dealers here to a proportionate rise in price, but which must be increased soon to meet the present cost and charges. Our impression is, that the price in this part will range through the spring at £9 15s. to £10 per ton.

"The demand for the finer descriptions of iron, manufactured in Staffordshire and Shropshire, is equally great, and the makers there have even more difficulty in keeping pace with it than their Welsh neighbors. It would be very easy for them to obtain a considerable advance, but the leading makers, from the prudential motives referred to, are anxious to keep rates as they are, and it is to be hoped that their counsels may prevail at the quarterly meeting which will shortly be held.

"The increasing use of iron in the construction of steam and sailing ships, bridges, etc., (for the Menai tabular bridge alone 8,000 tons are contracted for,) insures to this district full employment and high prices for a long time to come.

"Scotch pig iron being now an article much

speculated in, has not maintained equal steadiness of price with manufactured iron. During the year prices have varied from 65s. to 77s. 6d. per ton, cash, free on board at Glasgow, for mixed numbers. In November, great dullness prevailed, and the price fell to 68s. per ton, since when it has gradually advanced to 75s. per ton, at which considerable firmness at present prevails.

"The following statement of stocks shows a reduction during the year of about 80,000 tons; a large quantity certainly, but which is accounted for by the extensive shipments to the continent of Europe, induced by the moderate rates of 65s. to 70s. per ton, which prevailed from April to August. As the stock has not diminished since August, and we commence the year with about 150,000 tons, and may calculate upon a make of at least 600,000 tons during it, should no unlooked for obstruction arise, we may fairly count upon a sufficiency for all demands, and cannot expect any permanent advance above the present rates:

Estimated stock, December, 1845.....	220,000 tons.
" make in 1846,.....	520,000 "
" stock 1st January, 1847.....	144,300 "
" export and consumption in 1846.....	595,700 "

#### Extensive Manufactory.

In the last number of Hunt's "Merchants' Magazine," we find the following notice of the perfumery manufactory of Eugene Roussel, in Philadelphia, which is the most extensive establishment in the United States. Mr. Hunt says:

"M. Roussel is a Frenchman, and came to this country in 1838, when he commenced the manufacture of perfumery in every variety; and, from a very small beginning, he has risen to be one of the most extensive manufacturers in the world. The large experience which M. Roussel enjoyed in Paris, as foreman of the extensive house of Laguerre, Pere et Fils, so generally known for more than half a century throughout all Europe, and who were honored with a silver medal from the French government, at one of the great triennial exhibitions of the products of national industry in France, eminently qualifies him to conduct, profitably and honorably, the business in which he is engaged. The capital invested in Roussel's establishment, exceeds \$50,000, and the number of hands employed, is over 100.—The shaving cream manufactured at this establishment, is of a superior quality, and exceeds 10,000 pounds per annum; which at a very moderate calculation of 25 times for every box, would shave 4,000,000. Roussel manufactures over 50,000 lbs. of toilet soap, of all kinds, and 2,500 gallons of cologne water, besides a large quantity of hair oils, pomatum, extracts for the handkerchief, hair dyes, etc. The amount of his annual sales of perfumery and soaps, exceeds \$60,000.

"M. Roussel was the first to introduce mineral water into the United States, in bottles, which he commenced in 1839. The sales of this water did not average more than 10 or 15 dozen bottles per day, and at this time he puts up and sells from 1300 to 1400 dozen daily. Not less than 100 establishments for the manufacture, have grown up since M. Roussel introduced its manufacture into the United States. The value of the corks consumed, alone, amounts to \$10,000; sugar, \$12,000; cost of bottles per annum, \$6,000; number of bottles manufactured per annum, 4,500,000. The total value of mineral waters sold, amounts to \$60,000. The amount of wages paid persons in the manufacture of the several articles, is about \$30,000. M. Roussel has received several gold and silver medals from the different industrial institutions of our country, and we have no doubt but that the articles from his establishment are equal in every respect to those made in Paris"

Correspondents will oblige us by sending in their communications by Tuesday morning at latest.

### AMERICAN RAILROAD JOURNAL.

Published by D. K. MINOR, 105 Chestnut St., Philadelphia.

Saturday, March 6, 1847.

### MISSING NUMBERS OF THE RAILROAD JOURNAL.

Subscribers, who wish to obtain Missing Numbers of Back Volumes of this Journal, will do well to apply BEFORE the 1st of APRIL next, as, after that period, they cannot be obtained!

### BOUND VOLUMES.

Volumes of this Journal, for the Years 1838 to 1846, INCLUSIVE, may be had Bound, at Subscription Price, on application at this Office.

One or two COMPLETE SETS of the RAILROAD JOURNAL may be had in a few weeks—or as soon as two numbers can be reprinted—by application to the Editor.

The Table of Railroads in the United States will be sent out in the next number.

### FRANKLIN HOUSE,

No. 105 Chestnut Street, Philadelphia.

The undersigned takes the liberty of calling the attention of the readers of the Journal to the fact that the Office is removed from New York to the FRANKLIN HOUSE, Philadelphia, where he will be always pleased to meet and greet them. They will not only find a pleasant Reading Room, with lots of foreign periodicals, treating of Railroads and Machinery, but they will always find good-sized and airy rooms—clean beds—and a well supplied table. If they would have further proof of this, they have only to call, and judge for themselves, and much oblige the proprietor,

D. K. MINOR.

### Mr. Reobling's Communication.

We conclude, in the present number, the able and highly interesting article of Mr. REOBLING, on the subject of the great continuous chain of railroad from the Atlantic coast to the city of St. Louis.—We again ask for it the special attention of our readers—confident that it will well repay a careful perusal. The pamphlet edition of the article, entire—of which we have printed a large number—will be put into circulation immediately.

### Central Railroad.

Some opposition made its appearance in the Legislature of our State, it seems, in regard to the Central Railroad; and the friends of this measure entertained fears that its progress would be temporarily retarded. The North American of Friday, (through its Harrisburg correspondent,) gives the gratifying information that all opposition to the bill, in the House, was withdrawn, and it is now before the Senate. Some opposition may be looked for in that

body, but it is confidently expected, it will receive the sanction of the majority and be sent to the Governor.

The North American remarks that "it was hoped that it had outlived the prejudices against it; and that, at a time when our sister States are pressing so eagerly onward to the acquisition of the trade of the west, every Pennsylvanian would regard with pride the enterprise and vigor manifested by the citizens of this State in relation to this noble enterprise."

P. S.—THE LETTERS PATENT for the Pennsylvania railroad were received in this city on Friday evening. We congratulate the community upon the bright prospects for the future, which are now before us, and join in the exultation which the untiring advocates of the road must feel at the consummation of their ardent wishes.

### Cutting the Telegraph Wires.

The wires on the Boston and New York Telegraph line, were severed again on the arrival of the Cambria, this week. A cotemporary says that "it is probable that the persons who have for some time back been tampering with the Telegraph wires between New York and Boston, especially at periods when foreign steamers are due, or have arrived, will be discovered. Just after the arrival of the Cambria at Boston, the wires were cut at Brighton, about 4 miles out. The severance was, however, soon detected, and the communication made complete again, so that the news was regularly transmitted. Two persons, one a female, went to Worcester in the 4 o'clock cars, and asked to have a communication in cypher forwarded to New York. They had been carefully looked after by the Telegraph agents and the railroad conductors, and circumstances pointed to them so strongly, that the communication was refused—the plea being that 'Boston was in communication with New York.' The parties have been traced, and their guilt will probably be established."

### Wire Bridges.

It is stated in the Rochester Democrat, that the Niagara Suspension Bridge Company will shortly proceed to the erection of a Wire Bridge across the Niagara river—the Queen's assent having been obtained. The whole of the stock, \$200,000 has been taken—one-half in Canada, and the remainder in New York and this city. The paper further says:

"Contractors in Philadelphia and Pittsburg offer to build a good and substantial bridge of wire for \$300,000. It will be 40 feet wide—the centre track for cars to connect with the Canada road through to Detroit, and capable of transporting 300 tons over it at once, at the rate of 10 miles an hour. There will be two tracks for carriages and a foot path. It will have three spans with abutments 200 feet high. It is supposed it can be completed in two years, which will make it ready for use by the time the Canada road is completed."

Thereputation of the "contractors" in Philadelphia and Pittsburg, competent to construct these bridges, is world-wide—and if they undertake it, the work will be creditably and substantially executed.

It is a mistake however, we imagine, that there is to be three spans. According to our information there is to be a single span, of about 750 feet, reaching from the American to the Canadian shore. It is true that the abutments are 200 feet high, but they are the natural banks of the river.

### Steam Coaches.

SIR JOHN RENNIE, in his late Address to the Institution of Civil Engineers in London, states that "Great efforts have been made to perfect steam coaches, so as to enable them to travel upon turnpike roads—but without much success. The idea was

suggested by Robinson to Watt, in 1759, and Watt patented it in 1784. Symington proposed it in 1786. Trevithick's patent of 1802 was the first high pressure engine that was actually made, and patents for improvements upon it have been numerous. Bramah constructed a steam coach in 1822 for Griffiths, which was not successful. Gordon tried one in '34, and Gourney, who was more successful, constructed some with boilers, having very small tubes; he attained a speed of 10 miles an hour on good turnpike roads, and ascended the steepest hills near London, he went from London to Bath and back, in 1831; and his steam carriages ran for four months between Cheltenham and Gloucester; but it was extremely difficult and too expensive to keep them in order.—Hancock constructed several with boilers composed of thin metal chambers; they ran for some time with apparent success; but there were so many difficulties that they did not get into use. Dance, Field, Hill, Macerone, Russell, Cayley, and others, also attempted it with varied success; but the system is inferior to that of railway travelling, and it is now generally given up as hopeless. It has been proposed to employ highly compressed air in place of steam, for propelling locomotive engines—first by Medhurst in 1799, and since by others—but without any trials being made beyond mere models."

### Railroad Items.

We learn from the Journal that workmen are employed in laying the foundation of a new brick passenger house for the Boston and Providence railroad company in Boston. It is to be about 300 feet in length, and will front on Pleasant street. The same company have just completed a new brick freight depot, 240 feet long, with an L of 50 feet long by 60 feet wide.

The citizens of Bangor, at a full meeting on Thursday evening last, expressed an unanimous opinion in favor of the Waterville and Danville railroad route.

The Bath Tribune says the subscriptions to the Penobscot railroad now amount to \$800,000. The directors have laid an assessment of five per cent. on the stock, to commence the work with. Mr. Green is organizing a corps of engineers, and will commence the survey about the middle of this month. Next Fall will see the road finished.

The business of the Georgia railroad, during the week ending Feb. 6th, 1847, amounted to \$10,337.

A correspondent of the Traveller, speaking of the Worcester and Nashua road, says its speedy construction may be regarded as certain. Its location is such as to secure a large local business. Having Worcester and Nashua (important points) as termini, it passes through the towns of Groton, Pepperell, Shirley, Lancaster, West Boylston, etc. The large business of these towns, with their manufacturing villages, and water power still to be improved, and agricultural products, etc., cannot fail to make the stock a good investment. Over forty miles will be saved in distance to the vast number of passengers from New Hampshire, going south and west.

The Worcester Palladium says that the Directors of the Western railroad have submitted to the town of Southbridge a proposition to build a branch, on certain conditions, to that town, from or near their depot in Charlton. It is his opinion that the requisitions will be complied with by the town. The length of the branch will be about nine miles, and the route, it is said, is quite feasible.

The Burlington Free Press thinks the passage of the railroad across the lake, by bridging, or otherwise, at Grand Island, quite out of the question, and

that there must be a transshipment from Burlington to Port Kent, making Burlington the terminus of the Boston roads. On the other hand, the Montreal Courier has the following paragraph:

"Latterly a most distinguished and experienced surveyor has been employed to find out the most advantageous railway route between Burlington and Ogdensburg, and it appears that after a competent survey, that gentleman has discovered and recommended a new and most favorable line.

"This line, in leaving Burlington, is to run along the east side of lake Champlain until it reaches St. Albans—from thence through Hog Island and St. Albert, in a direct line to Rouse's Point, where every facility is found for the construction of a permanent bridge across the Richelieu; the line then pursues its course through a level tract of land a little to the south and parallel with the divisional line 45, passing through the thriving village of Malone, and from thence taking the direction upon the borders of the St. Lawrence to Ogdensburg."

#### The Feeling in Maine.

The *Bangor Whig* states that the late meeting there, in relation to the proposed railroad eastward from Portland, was an enthusiastic gathering. About three hundred of the active business men, capitalists and the heart and muscle of the citizens, had signed the call for the meeting. At an early hour the City Hall was thronged, the galleries and every part, and stuffed and rolled up, head above head, to the ceiling. And after this there were hundreds who could not gain admission. There was a full representation of the different parties and various interests of the city. They met to express their opinion upon the subject of railroad communication between the city of Bangor and the westward, and it was found that amidst the vast throng assembled, there was in fact but one opinion, and that in favor of the Waterville and Lewiston route to Portland. This was the prevailing opinion among the citizens before the meeting, and there it was strengthened and clinched and made unalterable.

The remarks of Governor Kent, relative to the growth, present standing and future prospects of the city, were well calculated to direct attention to the importance of inviting investment of capital in manufactures here by securing the facilities of railroad communication with other portions of the country.

Attorney General Moore made a very clear statement of the advantages that would result to the State, and particularly to Bangor, from the construction of a railroad running through the valuable portion of the State between Waterville and Lewiston, calling out the full powers of that region of country, and stimulating to new life and greater efforts the whole State. It was a plain, forcible and convincing argument, from one filled with the subject, who comprehended with great clearness the merits of the subject. His remarks were listened to with much attention, and were repeatedly applauded.

The chaste, unpretending, business-like remarks of Rufus Dwinel, Esq., were calculated to give confidence to the enterprise of building the road, and were listened to with much attention and satisfaction.

Moses L. Appleton, Esq., was quite happy in his brief remark, particularly in reference to the union and harmony apparent in the meeting—although composed of so many various opinions and oppositions on other subjects.

On the whole, the meeting was indeed a "rouser" such as few occasions could bring together. We hope by and by to see many more meetings for helping forward the building of a railroad from this city

west, but we never expect to attend one which shall give more general satisfaction than that of Thursday evening.

#### New York State Canals.

We have received, says the Albany Journal a copy of the report of the Canal Commissioners made to the legislature of this State.

There have been more breaches in the canals during the past season than usual. Notwithstanding these occasional interruptions, there has been a large excess of tolls received over any former year, and a corresponding increase of business, of tonnage and of lockage, as well as of larger cargoes.

The amount of tolls received on all the State canals during the season of navigation in 1846 has been as follows:

On the Erie Canal .....	\$2,499,275 58
Champlain canal .....	108,094 67
Oswego canal .....	58,185 43
Cayuga and Seneca canal....	27,282 11
Chemung canal .....	13,503 44
Crooked Lake canal .....	1,912 81
Chenango canal .....	23,492 86
Genesee Valley canal .....	23,448 57
Oneida Lake canal .....	542 80
Seneca river towing path....	368 10

Total .....

Being an increase of \$109,924 50 over the receipts of 1845, notwithstanding the reduction of over 13 per cent. in the rates of tolls which took effect on the opening of navigation.

The expenditures by the superintendents of repairs on all the canals, including their salaries, the pay of lock tenders, etc., from the 30th September, 1845, to 30th September, 1846, amounts to \$507,433.

With regard to the lockages on the canals, we find the following particulars respecting an old lock on Fort Plain:

"During the months of October and November in 1845, the number of lockages made at this lock was 9,834, and in 1846, 10,224, being an increase of 390 in the latter over the former two months.

"The average number per day for the 25 days in November previous to the navigation being obstructed by ice, was 201.

"The largest number that passed this lock in any one day was 258, or one in about every five minutes."

The report estimates the expense of bringing into use double locks between Albany and Syracuse on the plan of using the old by the side of an enlarged lock, at \$334,500. On the plan of double enlarged locks it is estimated at \$639,000.

The remainder of the report is chiefly occupied with statements of the present condition of each of the canals.

We see by the Albany papers that, on Tuesday, a report was made by the commissioners of the canal fund to the legislature, of the quantity of products from, and the merchandize going to, other States during the last season of canal navigation. This statement shows that the total amount received for tolls on account of the trade with other States was

By the way of Buffalo .....	\$1,321,229
By the way of Oswego .....	185,892
By the way of Whitehall .....	22,475

Total .....

The rates of toll were reduced last spring on an average 13½ per cent. The products from other States including merchandize going to them, at rates of toll of 1845, would have yielded a revenue of \$1,653,658. The difference is equal to \$324,133. The reduction in the rates of toll were made with a view of increasing the products transported to such an extent

as to keep up the aggregate amount of revenue.—And it is believed the result has justified these anticipations. In the single article of corn there has been received

By way of Buffalo .....	1,191,069 bushels.
And by way of Oswego .....	333,066 "

Total .....

In 1845, less than 50,000 bushels of corn were received from other States; showing an increase in this article alone, of more than 1,400,000 bushels.

By comparing the tolls at Buffalo, Black Rock, and Oswego, for the years 1845 and 1846, it will be seen that the trade has greatly increased, and tolls were reduced with a view of increasing trade without diminishing revenue. The comparison is as follows:

Tolls Received	1845.	1846.	Increase.
At Buffalo .....	\$482,635	\$763,683	\$281,048
At Black Rock .....	56,583	83,929	27,346
At Oswego .....	138,704	165,866	27,162
At Whitehall .....	55,911	61,675	

Deduct decrease at Whitehall .....

Net increase .....

The tonnage from western States by way of the Erie canal was, in

1846 .....	506,830 tons.
1845 .....	304,551 "

Increase in 1846 over 1845 .....

The total value of products cleared at Buffalo, and mostly from other States was, in

1846 .....	\$15,819,314
1845 .....	9,510,000

Increase .....

#### Locomotive Engines.

A Correspondent of the London Mining Journal thus speaks of an eight wheel engine of Mr. W. Stubbs.

"The engine, we are credibly informed, is of immense power, travels easier, and is more steady than the six wheel engines. We understand that Mr. Stubbs has already brought out many valuable improvements, and those patented by Messrs. W. Stubbs and J. T. Grylls, of Llanelly, (the plans of which we have seen in London) appear to be well worth the attention of railway superintendents and engineers. We hope to see full particulars in your paper soon, as we believe some are being built at the manufactory of Messrs. Grylls & Co., Llanelly. We understand that in the case of the eight wheel engine, Mr. Stubbs does not wish, or intend, it to be thought, that this is the first attempt that has been made to use eight wheels, as that has been done upwards of 30 years ago, but this is the first successful attempt; and which, by the means adopted, has made a much better engine than any of the former eight or present six wheel engines."

#### A Valuable Discovery.

The New York "Farmer and Mechanic," thus alludes to an important invention, lately discovered: "Those who have been conversant with our journal, will recollect that we adverted to the fact of this discovery some months since, but now we are prepared to say even more than we had ourselves dared to hope from the invention, which is Wood & Hancock's patent oil saver and chemical oil. This discovery, we think, is destined to obviate the use of sperm and lard oil for railroads, machinery, etc., wherever the article is introduced. The great advantages over common oil for the above purposes, are apparent to any one who will take the trouble to investigate the subject, as in its application to the journal, not a particle is wasted, and the liquid, being enclosed, is kept free from dust and every impurity which can have a tendency to wear the journal, while the accu-

nomy in the saving of time is very great, both in its application to, and the cleansing of, the machinery, when oil is used.

"In regard to this invention, we invite particular attention to the certificates and testimonials of those who have tested the article, and which appear in our advertising columns, and, from a personal acquaintance with the efficient and enterprising general agent, ex-Alderman E. F. Brigham, of Brooklyn, together with the utmost confidence in him, and those well known enterprising gentlemen, Messrs. John W. Cochran & Sons, whose names we have the pleasure of introducing to our readers, in their disinterested certificate in its favor, and our own observation, we are prepared to say much, very much, in its favor. We are inclined to believe that those who early secure the advantages it offers, will derive essential benefit from its adoption."

#### Great Central Railroad from Philadelphia to St. Louis.

BY JOHN A. ROEBLING, C. E.

Written for the Railroad Journal, and read before the Board of Trade of Pittsburg.

(Continued from page 141.)

#### LOCATION THROUGH PENNSYLVANIA.

The practicability of constructing a continuous railroad with easy grades, from Philadelphia to Pittsburg, has been doubted by many. An opinion, that the ranges of the Allegheny mountains within the boundaries of Pennsylvania, formed insurmountable obstacles, which did not exist in the neighboring states, was generally received. No facts, however, had been disclosed, which proved this popular belief to be correct. One cause of this delusion may be traced in the circumstance that the greater part of the travel through Pennsylvania, between the East and West, passed along the southern Turnpikes, either to Baltimore or Philadelphia. The barriers upon the Chambersburg route particularly, were well calculated to cause unfavorable impressions upon the minds of stage coach travellers.

When we project a railroad route, through an extensive country intersected with mountains, we cannot solve this question by simply running ahead with the compass, chain and level. The engineer who is charged with this task, will, before he can enter upon details, have to take a general view of the whole mass of country before him; he must examine its geological features, as far as the configuration of the surface is concerned, and trace its connection with the water courses as now existing; he must, in fact, study the history of the surface of the country before he can be prepared to locate.

In the formation of the surface of our globe two agencies have been mainly at work, fire and water. In other words, the present configuration of the earth's surface has principally been formed by volcanic upheavings, and by abrasion or reduction, caused by the action of water descending from a higher level to a lower.

The Alleghenies, as well as other mountain ranges, owe their elevated position to volcanic action. The upheaving forces were, in the case of the Alleghenies, more powerful East of the main range, than West. We observe a very distinct difference between the geological features of the East and those of the West. All those numerous ranges situated East of the Allegheny ridge, show marks of a much more violent volcanic action, than those West. In the East we discover none of the strata in their original position in which they were formed; they are violently thrown up, occupying all inclinations, from a level to a vertical position, some reversed. The country west of the Allegheny, shows no marks of the same violence; the forces which there operated acted more gently, and without bursting their fetters. The strata are there found in a position not varying much from the horizontal; the dip, or inclination is more uniform and gradual. The general slopes of the countries bordering on the Alleghenies, are, therefore, the result of volcanic action, they commence

at the ocean, and become more abrupt as they approach the mountain. There is no doubt that the whole country, west of the Alleghenies, presented at one time a gradual and uniform slope, falling gently off towards the Mississippi, which in those days formed an arm of the sea. The greater heat of the globe's surface, and the greater humidity of the atmosphere, in that period, caused more copious discharges of rain; these waters would, in their descent from the higher regions to the lower, collect into channels, which in course of time wore deeper and deeper. Such is the origin of our rivers, creeks, runs, hollows and drafts. What are now small insignificant rivulets, running dry the greater part of the season, along the bottoms of deep valleys, extensive ravines and hollows, were, in those days, large streams and mountain torrents, sufficiently powerful in their descent, not only to excavate earth and loose materials, but also to move along large masses of rock.

The valleys included between mountain ranges, as, for instance, the valley of Ligonier, between the Chestnut ridge and the Laurel hill, and the valley of Somerset, between the latter and the Allegheny mountain, formed at one time *lakes* without any outlets. The discharge of those lakes over the crest of the barriers where they were lowest, wore out channels, which in course of time became mighty cataracts. Those large gaps which we now see in the Chestnut ridge and Laurel hill, and which still serve for the discharge of the waters of the Black Lick, Connemagh and Youghioghenz, are the result of that mighty process of nature.

The counties situated west of the Chestnut ridge, presented at one time, as was mentioned above, a uniform level, slightly descending towards the west, in fact such slopes as are yet to be found this side of the Rocky Mountains. As time passed on, the waters made their marks more distinctly. Deep channels were formed, and the action of copious rains continued to wash off the ground, and the face of the country was gradually transformed into a waving and broken surface.

The same causes by which those changes were wrought are still at work, but less violent. The mountains and other elevated portions of the earth's surface are continually reducing; what wears off serves to fill up the ocean, or to form alluvial bottoms.

That the country west of the Alleghenies formed at one time a uniform slope, has become certain to me, by comparing numerous levels during the course of my surveys. If extensive levels were run through the counties of Fayette, Westmoreland, Indiana and Jefferson, parallel to the Chestnut ridge, we should find the main dividing ridges, and ranges of hills, of nearly the same elevation.

The preceding remarks lead to that important conclusion, that in a country like western Pennsylvania, railway lines should, as much as possible, be located along the principle water courses and their slopes, which have been graded by nature on the largest scale. When we attempt to locate a line at right angles to these water courses, we will encounter great difficulties, and often be obliged to resort to steeper gradients, or heavy cuttings and embankments.

In consequence of a closer proximity of the ocean to the mountains, the discharge of the waters was much more violent in the east than it was in the west. This has rendered the mountain slopes, and the approaches much more abrupt on the one side than on the other. The same applies to the slopes of the Rocky mountains, which are precipitous and bluff on the western, but very gentle on the eastern side.

With the exception of the Allegheny proper, all the other mountain ranges which run parallel to it, from the north east to the south west, are broken by *gaps*, which present easy passages for the location of roads. The Allegheny mountain itself, forms one uninterrupted ridge, from the west branch of the Susquehanna in Pennsylvania, to the state of Tennessee. The distinct feature of this mountain commences near the West branch, which river has broken through it, and apparently takes its rise on the very slope of the Mississippi valley.

If the question was to locate a railway between the east and west, with the least amount of ascent and descent, regardless of distance, the waters of the West branch, in connection with those of the Allegheny, would present the only course which could be pursued. It is indeed to be regretted, that at the time the Pennsylvania canal was undertaken, no greater efforts had been made to establish an uninterrupted water-communication between the Ohio river and the Susquehanna. The surveys of Mr. Ayerigg have established since, that such can be done by connecting the headwaters of the West branch with those of the Redbank, streams interlocking each other.

Although the course of the west branch would have offered a good location for a continuous canal, it cannot be considered, when we have to establish a direct railway; the increase of distance by that route would be over 100 miles.

Next to the West branch we have only one more tributary of the Susquehanna, by which the Allegheny mountain can be reached. The Juniata river breaks through the whole group of mountain ranges, which traverse the country from the North East to the South West; its two main branches extend their ramifications to the very centre of the Allegheny range. South of the Juniata, we meet with no other leading water course within the state of Pennsylvania; we should have to proceed to the Potomac river, forming the line between the states of Maryland and Virginia, and along which the Baltimore and Ohio railroad from Harper's ferry to Cumberland has been located. The Columbia railroad and the Lancaster and Harrisburg road, being proposed as links on the Central road, Harrisburg will be the point of commencement of the new route. A straight line from Philadelphia to Pittsburg approaches Harrisburg; distance of the latter from Philadelphia 106 miles.

The Chambersburg route, which has been strongly recommended, presents obstacles to the location of a railroad with easy grades, which can only be overcome at a great loss of distance, and at a very considerable increase of rise and fall. While on the Juniata route we have only one single mountain to overcome, viz.: the Allegheny proper, we encounter on the other two more formidable barriers, Cove mountain in the East, and Laurel hill in the West. The former presents no gap north of the Licking Creek, (a branch of the Potomac,) and can therefore not be avoided. The Laurel hill may, on that route, be avoided by descending from the town of Berlin, which was made a point in Mr. Hague's survey in Somerset county, along the waters of Cartleman's river, and intersecting one of the locations of the Baltimore and Ohio railroad to Pittsburg. This, however, could not be effected without a further sacrifice of distance. The whole route from Chambersburg to Pittsburg has been so well examined by state surveys, that it would be a waste of time and expense to bestow any more pains upon it. That country will admit of a good turnpike at two and a half degrees, but of no railroad.

Since it is proved that the location of the eastern part of the Central railroad must necessarily be confined to the region of the Juniata, the scope for our surveys becomes at once contracted. Although the general sweep of that river falls considerably north of the straight line from Harrisburg to Pittsburg, it is still a fortunate circumstance, that its headwaters approach those of the Connemagh, and of the Black Lick. These latter water courses, on the other hand, coincide remarkably well with the general route to Pittsburg, particularly the Black Lick; and as they have forced a passage through the Laurel hill, as well as the Chestnut ridge, their slopes present an easy descent towards the Ohio. The general route of the Harrisburg and Pittsburg railroad must, therefore, necessarily be located along the courses of the Juniata and Connemagh, the Black Lick forming a branch of the latter.

The Juniata divides into two main branches, the Raysstown and Frankstown branch; it is only the latter which can be pursued.

By locating a railroad along the canal from Harrisburg to Pittsburg, and using the portage for crossing the

mountains, we should obtain a succession of very easy grades, and save the expense of constructing the mountain section. Three great objections, however, present themselves to this location: the circuitous windings of the Juniata from Lewistown to Hollidaysburg, the Portage road with its inclined planes, and the great loss of distance caused by following the Kiskiminnas and Allegheny river. I propose to consider these difficulties, and give a general description of the lines, as actually located. For minute details, I must refer to the reports of Mr. Schlatter.

The portion of the line from Harrisburg to Lewistown presents no difficulties; the general course of the canal is pursued, without interfering with it, distance 60 miles; grades vary from a level to 26.40 feet per mile. To cut off a great bend in the Juniata, this river is left at Lewistown, the gap in Jack's mountain is passed, and the valley of the Kishicoquillas creek pursued to the dividing ridge, which is formed between this water and Mill creek. The grades of this ascent do not exceed 26.40 feet per mile. The line then descends at a similar rate along Mill creek, towards Huntingdon. While the grades of the river route will vary little from those of the valley route, the distance by the latter is ten miles less. The comparison is altogether in favor of the Kishicoquillas route. See Mr. Schlatter's report.

The comparisons between the different routes were based upon an annual business of 60,000 through passengers, and 40,000 tons of goods. It will be acknowledged by all parties, that this is a very moderate allowance. Should the plan be carried out, which is here proposed, to form a continuous railroad to St. Louis, and place it under one general management, I should base the comparisons of future surveys upon an annual business of 300,000 through passengers, and 250,000 tons of freight. It would be an injustice to the road to allow less.

From the mouth of Mill creek the Kishicoquillas route is continued along the Juniata, through the town of Huntingdon, to Petersburg, at which place the Little Juniata empties into the Franktown branch. Thence the course of the Little Juniata which forms a gap through Tussey's mountain, and its slopes are pursued, until the summit of the Allegheny mountain is attained. At the break through Tussey's mountain opposite Dorsey's forge, the so called Stone Mountain route intersects. I will explain this line before I proceed with the other.

The Stone Mountain route which I have personally located, has on several occasions, and most severely but unjustly, for want of a proper understanding of the matter, been commented upon. I feel it due to Mr. Schlatter and to myself to explain. The features of that whole country, intricate and wild as they are, are clear to my mind; I have studied them thoroughly, and venture to say, that future surveys, if conducted by competent Engineers, will corroborate what I here do affirm, and what has been ascertained to be facts.

An inspection of Mr. Schlatter's map will show that the Kishicoquillas route forms an abrupt bend at the mouth of Mill creek. To cut this off, and to effect a further saving of distance of 11.23 miles, is the object of the Stone Mountain route. This line forms a succession of 45 feet grades, and is, for about one half of its distance, located over exceedingly difficult ground. A tunnel of 1.06 miles long through Stone Mountain, and several extensive and high viaducts\* become necessary. Against these works the principal objections have been raised but why, has not been explained.

If long tunnels and high viaducts are serious objections in themselves, then one half of the railways in England, and on the Continent of Europe must be pronounced flat failures, because they abound in these very features. Tunnels in those countries are not only resorted to from necessity, but more frequently for the purpose of straightening lines, saving a little distance and expense. High and extensive viaducts may be seen there, stretching across valleys, rivers, and even

over populous towns; the traveler delights to ride over them, as if through the air, knowing them to be just as safe as *terra firma* itself. They can be made perfectly safe, and should be made so at any rate. What serious objections then, remain to be preferred against the Stone Mountain route? None but that of greater expense of construction! This question, then, resolves itself to one of dollars and cents, and not of long tunnels and high viaducts.

In comparing the two routes, we have to estimate the expense of all items of first construction, repairs and gradual wear; we have to equate the gradients and curves, and value the expense of annual transportation. The merits of the two routes, after taking all things into consideration, are then to be represented by two sums of money,—the smallest is of course to be preferred. Any other mode of settling such questions must, in the present advanced state of civil engineering, be rejected.

By referring to the comparisons in Mr.

Schlatter's report, it will be found that the value of the Stone Mountain route is represented by the sum of

\$117,672

The value of the Kishicoquillas route,

111,160

Showing a difference in favor of the valley

route of, \$ 6,512

This means that the annual expense of the Stone Mountain route, considering all things, will exceed that of the valley route by \$6,512, and that therefore the latter deserves the preference. But by assuming an annual business of 300,000 passengers and 250,000 tons of goods, the comparison will turn out the other way, in favor of the mountain route.

It may be, that future surveys will establish that the expense of the Stone Mountain route has been underrated, and that of the valley route overrated; if so, a conclusion to reject the former may be just and correct. But until such facts have actually been established, or a still better route has been discovered, no hasty opinions should be expressed.

At Dorsey's forge, where the Little Juniata breaks through Tussey's mountain, the Kishicoquillas and Stone Mountain route intersect each other, both pursuing the same route in ascending the Allegheny mountain. While the Franktown branch, and the canal take a more southern course to Hollidaysburg, the Little Juniata on the other side, forms a gradual sweep towards the north. Following the route of the canal to Hollidaysburg, we gain but little elevation, and find ourselves suddenly at the foot of the Allegheny mountain, within a distance of only ten miles to the summit, and an elevation of 1400 feet before us. A graded road from Hollidaysburg to the summit, with a uniform ascent, would have to rise at the rate of 140 feet per mile. By following the Little Juniata, however, the foot of the mountain is attained at Logan's narrows, near the junction of the Bald Eagle creek, at a distance of 32 miles from the summit. This point is 889 feet above tide, the summit 2183 feet. The difference of elevation is overcome at a rate not exceeding 45 feet per mile. The summit is known as Sugar run gap, situated about two miles north of the summit of the Portage railroad.

Descending the Western slope of the mountain, we come to a point three miles from the summit, where two different routes diverge, one taking the course to Ebensburg and of the Black Lick, the other pursuing the slopes of the Connemaugh to Johnstown. I will first give a general description of the Black Lick route to Pittsburgh.

The descent to Ebensburg is by this route effected without serious difficulties; the valley of the Black Lick then offers a very direct course to Pittsburgh, and an easy passage through the Laurel hill and the Chesnut ridge; the Connemaugh river is crossed at the mouth of the creek. From this point a very direct course has been pursued through the counties of Westmoreland and Allegheny, by following the valley of Turtle creek, and of the Monongahela. Although the location from the Connemaugh to the head of Turtle creek is very direct, the topography of this country is very unfavorable to the formation of a graded road.

We have to cross three water courses, Spruce run, the Logathanna river, and the Beaver Dam creek, and a number of intervening ridges, which render this portion of the line very expensive. The grades are undulating to the head of Turtle creek, thence uniformly descending to Pittsburgh. By adopting the line as located a distance is saved, from the mouth of the Black Lick to Pittsburgh, over the canal between the same points, of twenty-nine miles. This location is the result of an extensive instrumental examination, which covered a large portion of Westmoreland county. The grades on this route are confined to 45 feet per mile; it appears, however, probable that the great magnitude of the trade, to be expected on the Central road, will justify a further expense to be incurred, for their reduction to 40 feet per mile. This can be done by increasing the excavations at the dividing ridges, and raising the embankments across the hollows. Comparative surveys and estimates, however, will have to decide this question.

The Connemaugh route, as was mentioned before, diverges west of the Allegheny summit, thence descending, the Portage railroad is crossed at plane No. 3. This road is again intersected at various places, and made use of for a distance of eight miles. From Johnstown to Blairsville the opposite side of the canal is invariably pursued. The Black Lick and Connemaugh route intersect each other four and a half miles west of Blairsville.

The measured distance from Harrisburg to

Pittsburg, by the Stone Mountain and Black

Lick route, is 230 miles.

Add distance from Philadelphia to Pittsburgh 106 "

Total distance from Philadelphia to Pittsburgh 336 miles.

Should the future surveys and comparisons be based upon such a tonnage as may be reasonably expected on this great route, there is no doubt they will result in a further saving of distance, and of rise and fall.

By pursuing the Pennsylvania canal and the Portage railroad from Harrisburg to Pittsburgh, the distance from Philadelphia to Pittsburgh is 338 miles; therefore 52 miles more than by the Central route.

The distance from Pittsburgh to the summit of the portage railroad, pursuing the canal route, is 130 miles.

Distance from Pittsburgh to summit by Central route, 93 "

Saving of distance west of the mountains, 37 "

Saving of distance on the eastern side, 15 "

Total saving, 52 "

In regard to the Connemaugh route, it should be observed that its interference with the portage railroad is a very serious objection, and of sufficient weight to reject that whole line. The two roads running in one for some distance, and intersecting each other at numerous points, cannot be worked with such regularity, as to avoid collision of trains. Indeed, the present system of working the portage would not at all admit of such interference; a daily occurrence of the most frightful accidents would be the inevitable consequence.

It has been suggested to abandon the location of the whole mountain route from Petersburg west, and to continue the road along the canal to Hollidaysburg; to use the Portage railroad to Johnstown, and thence pursue the Connemaugh route. The relative distances by this route would be as follows:

The distance from Petersburg to Johnstown by the Central survey is, 74.65 miles

I estimate the distance from Pe-

tersburg to Harrisburg by rail-

way, 28 miles

Add length of portage, 36 "

Distance from Petersburg to Johnstown by Portage, 64.00 "

Saving of distance by Portage, 10.65 "

If this is deducted from the distance of the Central survey, by the Stone Mountain and Connemaugh route, from Harrisburg to Pittsburgh of 237.13 miles; it leaves but a distance of 226½ miles; add 106 miles from Har-

\* The two highest piers on the Kishicoquillas viaduct are 130 feet, the others diminish as the slopes of the ravine ascend.

risburg to Philadelphia, and we get a total distance from Philadelphia to Pittsburg, by adopting the Portage, of 332½ miles.

Adopting the Portage route, there would be saved the construction of 46½ miles of new road, which, when finished with double track, and assuming Mr. Schlatters estimate, would cost at the rate of \$55,000 per mile, or \$2,557,500

By substituting 28 miles of road along the canal from Petersburg to Hollidaysburg, in place of the route along the Little Juniata, there will be a saving of about \$8,000 per mile, or 224,000

Total saving, \$2,781,500  
Allow for improving planes and machinery on the Portage \$35,000 per plane, 250,000

Leaves a saving of, \$2,431,500

It would therefore appear that the adoption of the Portage railroad, is an object of the highest importance, and should be accomplished, *provided the planes of the Portage can be worked with perfect safety, and without any delay.* On this subject I have already expressed an opinion, in answer to a letter which was addressed to me by S. W. Roberts, Esq., and which has been published since in the U. S. Gazette. Some further reflections, however, prompt me to add a few more remarks.

If the question: "can the Portage road be worked as expeditiously and safe as any other road," cannot be answered satisfactorily in the affirmative, the idea of using this road as a link in the Great Central route, should be at once and peremptorily rejected. If this road was adopted, and accidents should occur on the inclined planes, travellers would rather prefer to go by a longer and more expensive route, than risk their lives on the Central. But if the Portage can be worked with safety and expediency, its novelty and remarkable operation would, on the contrary, add to the attractions of the route, and cause travellers to prefer it.

In my letter to Mr. Roberts, I recommended to relay the planes with good heavy rails, and put down fenderbeams, for the purpose of preventing the running off the track of the cars, as well as of the safety. Fenderbeams and heavy rails will, at the same time, admit of such important improvements in the construction of the *safety car*, that trains will be stopped gradually, but with unerring certainty, in case the ropes break. The action of the *safety* now in use, and in the present condition of the road, is always prompt, provided it is not jerked off the track when a rope breaks; to guard against this is one of the objects of the fenders proposed. The great expense of ropes, and the danger of their breaking, has been very materially reduced since the introduction of wire in place of hemp.

By combining, however, the improvements above suggested, with a system of working which has been but recently introduced, and in successful operation for the last year on the steep and long planes of the so-called *Black Track*, and on the Wilkesbarre planes of the Lehigh improvements, we shall not only be able to work the planes of the Portage with perfect safety, but also without any delay whatever; and to accommodate the same amount of traffic which can be passed over a graded road.

The success of the Lehigh mode of working, is principally owing to the use of *tender cars*, one on each track, permanently attached to the end of the iron straps which are there used in place of ropes, the latter working reciprocating, instead of endless or circulating. There may be either one single rope working both planes, as now arranged on the Portage, but omitting the sheave at the foot or two independent ropes, as is the case on the Lehigh.

A tender car is so constructed that upon reaching the foot of the plane it contracts in width, and proceeds upon a railway laid inside of the main track, and descends low enough to allow the train of cars to pass over it. The object of the *tenders* is to push up or to let down trains of cars, thereby saving all hitching, and

avoiding all delay. By means of *turn outs* at the head and foot of planes, an approaching train is run upon that track, which has the tender car ready for reception. Trains are not allowed to stop on their arrival at the head or foot of a plane. When arrived at the head of a plane, the machinery is started, as soon as the train touches the arms of the *leader car*, and so it goes down. On the approach of a train at the foot, the attendant pulls the wire connected with the signal bell at the head, the machinery is started, the *tender car* comes out of the pit in the rear of the train, and pushes it up. The *safety*, in use on the Lehigh, would not be applicable to the Portage; the one now in use on the latter has to be modified, and is to be permanently attached to the tender car. There is no difficulty in the arrangement of these details.

On a recent visit to the Lehigh works, I had an opportunity of witnessing the operation of the planes, and can state that they work perfect. The machinery is powerful enough to take up sixteen empty cars at once, on an inclination of 1 in 3½. The planes on the Portage only rise 1 in 10.

Edwin A. Douglass, Esq., the Chief Engineer of the Lehigh Company, accompanied me to the Portage, for the purpose of witnessing the operation of the wire ropes there in use. After observing the present slow and imperfect mode of working, he strongly recommended the introduction of the *tender car*. The great experience of this gentleman, in matters of inclined planes, entitle his opinion to the fullest confidence.

With the introduction of the *tender car* on the Portage planes, the steam power strength of machinery and *adhesion* should be increased, (most of the foundations being new and strong enough,) so that wire ropes of two or three times the strength of those now in use, can be worked, for the purpose of passing whole trains, with locomotive and all, at one time without dividing them; thereby saving all horse power, hitching and unhitching, and avoiding all crowding of cars on the road. The Hollidaysburg grade of 52 feet per mile, limits trains to fifteen cars average, with the engine now in use; it will therefore be good policy to work light locomotives and small trains. Locomotives in ascending planes, will take up their own weight, when the rails are in a good state.

With such arrangements, and an active and intelligent superintendent, the Portage railroad can be worked as fast, or nearly as fast, as any other graded road, and without the least danger. Three hours will be enough time for a passage from Hollidaysburg to Johnstown, a distance of 36 miles. Freight trains should be passed day and night; passenger trains may be so arranged as to cross only in daylight.

In order to accommodate the canal business, in conjunction with the business of the Central road, and without any confusion, a telegraph line should be established between Hollidaysburg and Johnstown.

It would appear desirable, before the use of the Portage as a link in the Central railroad is decided on, to apply the arrangements here recommended, to the Schuylkill plane, (which is generally worked much slower than the Portage planes now are,) and thereby give the public an opportunity of witnessing the operation.

An amalgamation of the Pennsylvania canal and of the Central railroad has been advocated by some, on the ground that the two improvements combined, and under one management, in place of competing with each other as rival lines, would assist and sustain each other. That such an arrangement would prove highly beneficial to the community at large, is not to be doubted; the question, how this may be effected, I leave others to decide.

In conclusion, I may yet remark, that the completion of the Central railroad will, like a great national event, form one of the most remarkable epochs in the history of Pennsylvania.

For some years past has this important project been allowed to sleep; the prosecution of rival works has caused its revival, and the infant project is now rapidly rising into favor. It needs, however, nourishing. great

attention, and sacrifice; but, if properly developed, it promises to return a hundred fold the cares bestowed upon it. Its future extension should be westward, to those distant regions which, even now, are ready to pour their rich treasures into our lap.

Like the New York canal, when it opened those vast and immense resources to the City and State of New York, the Great Central railroad is destined to become the future highway of an immense traffic, not ephemeral in its nature, but most stable and permanent. It will vastly contribute to the wealth of Pennsylvania, and place the future prosperity of Pittsburg and Philadelphia upon a basis which cannot be shaken.

Pittsburg, January, 1847.

#### Railroad Mania in Germany.

The mania for the construction of railroads which possessed England, seems, in a commensurate degree, to have taken possession of Germany, and the conduct of the Prussian Cabinet has been such as not only to advance this feeling, but to give it a changefulness that has been very detrimental to the interests of the people. Cabinet orders have placed certain railroad operations in a most enviable position for awhile, but a capricious repeal of the orders took away in a moment all the advantages of appearing to be a government stock, which the orders had imparted. The slow moving Germans have been startled from their even paced progress, and under the forcing system of the mania have so far departed from their usual safe methods of proceeding, as to invest such large sums in railroad stock, and to lock it up for years to come, that commerce is feeling very seriously the effect of the withdrawal.

The following summary statement of the financial position of the empire will afford a good idea of the difficulties that are to be met and overcome. That they will be, we have no doubt; but it will be many years before an even course of affairs will bless Germany. When it does come, however, the reward will be worth the pain of obtaining it.

"If we inquire the amount of capital already invested in this class of industrial undertakings, we shall find that during the last eight years a sum of £36,000,000 has been employed, in opening 3880 miles of railway communication. Of this sum, somewhat more than that has been furnished by the several governments, for the construction of State lines. The sum still needed, within a period of five years, to meet the liabilities of lines 2300 miles in extent, now in course of formation, is, in round numbers, £37,500,000. We thus arrive at a total of something less than £75,000,000 sterling, which, within a period of 13 years has been, or will be, converted into that species of public security which we call railway stock. We must further bear in mind that of the sum of £37,500,000, one-half is to be provided out of government funds; and being spread over a period of five years, would leave an annual sum of about £5,000,000 sterling, to be covered from the respective budgets of the different States, and a like sum to be furnished by private capitalists.

"Let us now glance at the collective population, budgets and national debts of the German States, (including, of course, Austria,) and we shall find that the number of inhabitants is about 60,000,000; the annual State expenditure about £56,000,000 sterling, and the general funded debt of Germany may be set down approximately at, about 1,000,000,000 of thalers, or £150,000,000 sterling. The bare consideration of these respective items, is sufficient to impress us with a sense of the magnitude of a crisis like the present, in a country where the monetary relations want that elasticity that results from our banking system. But we are very far from despondency, when we consider that the average rate of interest in Germany, on good landed security, is but four per cent., and that the returns of railway profit on all the German lines, 19 in number, up to the close of 1844, gave an average dividend of 4½ per cent. on the capital invested, with the gains steadily increasing."

**NICOLL'S PATENT SAFETY SWITCH** for Railroad Turnouts. This invention, for some time in successful operation on one of the principal railroads in the country, effectually prevents engines and their trains from running off the track at a switch, left wrong by accident or design.

It acts independently of the main track rails, being laid down, or removed, without cutting or displacing them.

It is never touched by passing trains, except when in use, preventing their running off the track. It is simple in its construction and operation, requiring only two Castings and two Rails; the latter, even if much worn or used, not objectionable.

Working Models of the Safety Switch may be seen at Messrs. Davenport and Bridges, Cambridgeport, Mass., and at the office of the Railroad Journal, New York.

Plans, Specifications, and all information obtained on application to the Subscriber, Inventor, and Patentee  
**G. A. NICOLLS,**  
Reading, Pa.

**RAILROAD IRON.—THE SUBSCRIBER'S** New Rail Iron Mill at Phoenixville, Pa., is expected to be ready to go into operation by the 1st of September, and will be capable of turning out 30 to 40 tons of finished Rails per day. They are now prepared to receive orders to that extent, deliverable after the 1st of October next, for heavy rails of any pattern now in use, equal in quality and finish to best imported.

**PIG IRON**—They are also receiving weekly 150 to 200 tons of No. 1 Phoenix Foundry Iron, well adapted for light castings.

**REEVES, BUCK & CO.,**  
45 North Water St., Philadelphia,  
or by their Agent, **ROBT. NICHOLS,**  
79 Water St., New York

**THE SUBSCRIBERS, AGENTS FOR** the sale of  
Codorus,  
Glendon,  
Spring M.I. and  
Valley, } Pig Iron.

Have now a supply, and respectfully solicit the patronage of persons engaged in the making of Machinery, for which purpose the above makes of Pig Iron are particularly adapted.

They are also sole Agents for Watson's celebrated Fire Bricks and prepared Kaolin or Fire Clay orders for which are promptly supplied.

**SAM'L KIMBER, & CO.,**  
59 North Wharves,  
Philadelphia, Pa.

Jan. 14, 1846. [1y4]

**RAY'S EQUALIZING RAILWAY TRUCK.—THE SUBSCRIBER** having recently formed a business connection in the City of New

York, expressly for the manufacture of the newly patented and highly approved Railroad Truck of Mr. Fowler M. Ray, is ready to receive orders for building the same, from Railroad Companies and Car Builders in the United States, and elsewhere.

The above Truck has now been in use from one to two years on several roads a sufficient length of time to test its availability, and other good qualities, and to satisfy those who have used it, as may be seen by reference to the certificates which follow this notice.

There have been several improvements lately introduced upon the Truck, such as additional springs in the bolster of passenger cars, making them delightful riding cars—adapting it to tenders, trucks forward of the locomotive, and freight cars, which, with its original good qualities, make it in all respects the most desirable truck now offered to the public.

Orders for the above, will, for the present, be executed at the New York Screw Mill, corner 33d street and 3d avenue, (late P. Cooper's rolling mills) and at the Steam Engine Shop of T. F. Secor & Co., foot of 9th street, East

**RAILROAD IRON.—THE NEW JERSEY** Iron Company, Boonton, N. J., are now preparing to make Railroad Bars, and are ready to take orders or make contracts for Rails, deliverable after the first of December next. Apply to  
**FULLER & BROWN,** Agent,  
No. 139 Greenwich, corner of Cedar street.  
September 18, 1846. 10:39

**LAWRENCE'S ROSENDALE HYDRAULIC** Cement. This cement is warranted equal to any manufactured in this country, and has been pronounced superior to Francis' "Roman." Its value for Aqueducts, Locks, Bridges, Floors and all Masonry exposed to dampness, is well known, as it sets immediately under water, and increases in solidity for years.

For sale in lots to suit purchasers, in tight paper barrels, by  
**JOHN W. LAWRENCE,**  
149 Front street, New York.

Orders for the above will be received and promptly attended to at this office. 32 17

**ENGLISH PATENT WIRE ROPES—FOR THE USE OF MINES, RAILWAYS, ETC.—** for sale or imported to order by the subscriber.

These Ropes are manufactured on an entirely different principle from any other, and are now almost exclusively used in the collieries and on the railways in Great Britain, where they are considered to be greatly superior to hempen ones, or iron chains, as regards safety, durability and economy. The plan upon which they are made effectually secures them from corrosion in the interior, as well as the exterior of the rope, and gives a greater compactness and elasticity than is found in any other manufacture.

Many of these ropes have been in constant operation in the different mines in England, and on the Blackwall and other inclined planes, for three and four years, and are still in good condition.

They have been applied to almost every purpose for which hempen ropes have been used—mines, heavy cranes, standing rigging, window cords, lightning conductors, signal halyards, tiller ropes, etc. Reference is made to the annexed statement for the relative strength and size. Testimonials from the most eminent engineers in England can be shown as to their efficiency, and any additional information required respecting the different descriptions and application will be given by

**ALFRED L. KEMP,**  
75 Broad street, New York, sole agent in the United States.

Statement of Trial made at the Woolwich Royal Dock Yard, of the Patent Wire Ropes, as compared with Hempen Ropes and Iron Chains of the same strength.—October, 1841.

river, (of which firm the subscriber was late a partner) under the immediate supervision of Mr. Ray himself.

Several sets of trucks containing the latest improvements have recently been turned out for the New York and Erie railroad, and the New Jersey Transportation company, which may be seen upon said roads.

The patronage of Railroad Companies and Car Builders is respectfully solicited.

New York, May 4, 1846.

**W. H. CALKINS, and Others.**

To all whom it may concern:—This is to certify that the New Haven, Hartford and Springfield railroad co., have had in use six sets of F. M. Ray's patent trucks for the last 20 months, during which time it appears to me, they have proved to be the best and most economical truck now in use.

[Signed,]

**WILLIAM ROZ, Supt of Power.**

I certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Philadelphia and Reading railroad for some time past, under a passenger car.

For simplicity of construction, economy in cost, lightness of material, and extreme ease of motion, I consider it the best truck we have ever used. Its peculiar make also renders it less liable to be thrown off the track, when passing over any obstruction. We intend using it extensively under the passenger and freight cars of the above road.

Reading, Pa., October 6, 1845.

[Signed,] **G. A. NICOLL,**

Supt. Transportation, etc., Philadelphia and Reading Railroad.

To all whom it may concern:—This is to certify that the N. Jersey Railroad and Transportation company have used Fowler M. Ray's Truck for the last seven months, during which time it has operated to our entire satisfaction. I have no hesitation in saying that it is the simplest and most economical truck now in use.

[Signed,] **T. L. SMITH,**

Jersey City, November 4, 1845.

**N. Jersey Railroad and Transp. Co.**

This is to certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Long Island railroad for the last year, under a freight car.

For simplicity of construction, economy in cost, lightness of material and ease of motion, I consider it equal to any truck we have in use.

Long Island Railroad Depot,

[Signed,] **JOHN LEACH,**

Jamaica November 12, 1845.

1y19 Sup' Motive Power.

**RICH & CO'S IMPROVED PATENT SALAMANDER SAFES.**

Warranted free from dampness, as well as fire and thief proof.

Particular attention is invited to the following certificates, which speak for themselves:

**TEST No. 10.**

*Certificate from Mr. Silas C. Field, of Vicksburgh, Mississippi.*

On the morning of the 14th ult., the store owned and decupied by me in this city, was, with its contents, entirely consumed by fire. My stock of goods consisted of oil, rosin, lard, pork, sugar, molasses, liquors, and other articles of a combustible nature, in the midst of which was one of Rich's Improved Patent Salamander Safes, which I purchased last October of Mr. Isaac Bridge, New Orleans, and which contained my books and papers. This safe was red hot, and did not cool sufficiently to be opened until 16 hours after it was taken from the ruins. At the expiration of that time it was unlocked, when its contents proved to be entirely uninjured, and not even discolored. I deem this test sufficient to show that the high reputation enjoyed by Rich's Safes is well merited.

S. C. FIELD.

**TEST No. 11.—Certificate.**

By the fire which occurred in this village on the 27th July last, our Law Office, together with many other buildings, was destroyed—we had in our office one of Rich's Improved Patent Salamander Safes, which, though heated red hot, preserved, without being the least damaged, many papers valuable to our clients—the envelopes of a few papers being slightly scorched. Some twenty-four hours after the fire, the Safe was removed, and so hot was it, that several hours were required for it to cool off. Our office was in the second story of a large brick building, all the wood used in construction of said house being pitch pine. While the Safe was red hot, one of the walls tumbled in, and so injured the lock that it was necessary to break the door open. From this test, we feel no hesitation in recommending "Rich's Patent Salamander Safe" as entirely fire proof.

GORKE & KING.

Marion, Ala., Sept. 15th, 1846.

*Still other Tests in the Great Fire of July 19, 1845.*

The undersigned purchased of A. S. Martin, No. 138 1/2 Water street, one of Rich's Improved Patent Salamander Safes, which was in our store, No. 54 Exchange place. The store was entirely consumed in the great conflagration on the morning of the 19th inst. The safe was taken from the ruins 52 hours after, and on opening it, the books and papers were found entirely uninjured by fire, and only slightly wet—the leather on some of the books was parched by the extreme heat.

RICHARDS & CRONKHITE.

Benton, Miss., December 27, 1845.

One of Rich's Improved Salamander Safes, which I purchased on the 3d of June last of A. S. Marvin, 138 1/2 Water street, agent for the manufacturer, was exposed to the most intense heat during the late dreadful conflagration. The store which I occupied, No. 46 Broad street, was entirely consumed; the safe fell from the 2d story, about 15 feet, into the cellar, and remained there 14 hours, and when found, I am told, and from its appearance afterwards, should judge that it had been heated to a red heat. On opening it, the books and papers were found not to have been touched by fire. I deem this ordeal sufficient to confirm fully the reputation that Rich's safe has already obtained for preserving its contents against all hazards.

(Signed.)

WM. BLOODGOOD.

New York, 31st July, 1845.

Reference made to upwards of nine hundred and fifty merchants, cashiers, brokers, and officers of courts and counties, who have Rich's Safe's in use.

The above safes are finished in the neatest manner, and can be made to order at short notice, of any size and pattern, and fitted to contain plate, jewelry, etc. Prices from \$50 to \$500 each. For sale by

A. S. MARVIN, General Agent,

138 1/2 Water st., N. Y.

Also by Isaac Bridge 76 Magazine street, New Orleans.

Also by Lewis M Hatch, 130 Meeting street Charleston, S. C.

16 11

**FRENCH AND BAIRD'S PATENT SPARK ARRESTER.**

TO THOSE INTERESTED IN Railroads, Railroad Directors and Managers are respectfully invited to examine an improved SPARK ARRESTER, recently patented by the undersigned.

Our improved Spark Arresters have been extensively used during the last year on both passenger and freight engines, and have been brought to such a state of perfection that no annoyance from sparks or dust from the chimney of engines on which they are used is experienced.

These Arresters are constructed on an entirely different principle from any heretofore offered to the public. The form is such that a rotary motion is imparted to the heated air, smoke and sparks passing through the chimney, and by the centrifugal force thus acquired by the sparks and dust they are separated from the smoke and steam, and thrown into an outer chamber of the chimney through openings near its top, from whence they fall by their own gravity to the bottom of this chamber; the smoke and steam passing off at the top of the chimney, through a capacious and unobstructed passage, thus arresting the sparks without impairing the power of the engine by diminishing the draught or activity of the fire in the furnace.

These chimneys and arresters are simple, durable and neat in appearance. They are now in use on the following roads, to the managers and other officers of which we are at liberty to refer those who may desire to purchase or obtain further information in regard to their merits:

R. L. Stevens, President Camden and Amboy Railroad Company; Richard Peters, Superintendent Georgia Railroad, Augusta, Ga.; G. A. Nicolls, Superintendent Philadelphia, Reading and Pottsville Railroad, Reading, Pa.; W. E. Morris, President Philadelphia, Germantown and Norristown Railroad Company, Philadelphia; E. B. Dudley, President W. and R. Railroad Company, Wilmington, N. C.; Col. James Gadsden, President S. C. and C. Railroad Company, Charleston, S. C.; W. C. Walker, Agent Vicksburgh and Jackson Railroad, Vicksburgh, Miss.; R. S. Van Rensselaer, Engineer and Sup't Hartford and New Haven Railroad; W. R. M'Kee, Sup't Lexington and Ohio Railroad, Lexington, Ky.; T. L. Smith, Sup't New Jersey Railroad Trans. Co.; J. Elliott, Sup't Motive Power Philadelphia and Wilmington Railroad, Wilmington, Del.; J. O. Sterns, Sup't Elizabethtown and Somerville Railroad; R. R. Cuyler, President Central Railroad Company, Savannah, Ga.; J. D. Gray, Sup't Macon Railroad, Macon, Ga.; J. H. Cleveland, Sup't Southern Railroad, Monroe, Mich.; M. F. Chittenden, Sup't M. P. Central Railroad, Detroit, Mich.; G. B. Fisk, President Long Island Railroad, Brooklyn.

Orders for these Chimneys and Arresters, addressed to the subscribers, care Messrs. Baldwin & Whitney, of this city or to Hinckley & Drury, Boston, will be promptly executed. FRENCH & BAIRD.

N. B.—The subscribers will dispose of single rights, or rights for one or more States, on reasonable terms.

Philadelphia, Pa., April 6, 1844.

\*. The letters in the figures refer to the article given in the Journal of June, 1844.

ja45

**PATENT HAMMERED RAILROAD, SHIP AND BOAT SPIKES.** The Albany Iron and Nail Works have always on hand, of their own manufacture, a large assortment of Railroad, Ship and Boat Spikes, from 2 to 12 inches in length, and of any form of head. From the excellence of the material always used in their manufacture, and their very general use for railroads and other purposes in this country, the manufacturers have no hesitation in warranting them fully equal to the best spikes in market, both as to quality and appearance. All orders addressed to the subscriber at the works, will be promptly executed. JOHN F. WINSLOW, Agent.

Albany Iron and Nail Works, Troy, N. Y. The above spikes may be had at factory prices, of Erastus Corning & Co., Albany; Hart & Merritt, New York; J. H. Whitney, do.; E. J. Eting, Philadelphia; Wm. E. Coffin & Co. Boston. ja45

**MACHINE WORKS OF ROGERS,** Ketchum & Grosvenor, Patterson, N. J. The undersigned receive orders for the following articles, manufactured by them of the most superior description in every particular. Their works being extensive and the number of hands employed being large, they are enabled to execute both large and small orders with promptness and despatch.

Railroad Work.

Locomotive steam engines and tenders; Driving and other locomotive wheels, axles, springs & flange tires; car wheels of cast iron, from a variety of patterns, and chills; car wheels of cast iron with wrought tires; axles of best American refined iron; springs; boxes and bolts for cars.

Cotton, Wool and Flax Machinery of all descriptions and of the most improved patterns, style and workmanship.

Mill gearing and Millwright work generally; hydraulic and other presses; press screws; callenders; lathes and tools of all kinds; iron and brass castings of all descriptions.

ROGERS, KETCHUM & GROSVENOR, 245 Paterson, N. J., or 60 Wall street, N. York.

**PATENT RAILROAD, SHIP AND BOAT SPIKES.** The Troy Iron and Nail Factory keeps constantly for sale a very extensive assortment of Wrought Spikes and Nails, from 3 to 10 inches, manufactured by the subscriber's Patent Machinery, which after five years' successful operation, and now almost universal use in the United States (as well as England, where the subscriber obtained a patent) are found superior to any ever offered in market.

Railroad companies may be supplied with Spikes having countersink heads suitable to holes in iron rails, to any amount and on short notice. Almost all the railroads now in progress in the United States are fastened with Spikes made at the above named factory—for which purpose they are found invaluable, as their adhesion is more than double any common spikes made by the hammer.

All orders directed to the Agent, Troy, N. York will be punctually attended to.

HENRY BURDEN, Agent.

Spikes are kept for sale, at Factory Prices, by I. & J. Townsend, Albany, and the principal iron merchants in Albany and Troy; J. I. Brower, 222 Water St., New York; A. M. Jones, Philadelphia; T. Janviers, Baltimore; Degrand & Smith, Boston.

\*. Railroad Companies would do well to forward their orders as early as practicable, as the subscriber is desirous of extending the manufacturing so as to keep pace with the daily increasing demand.

ja45

**SPRING STEEL FOR LOCOMOTIVES,** Tenders and Cars. The Subscriber is engaged in manufacturing Spring Steel from 1 1/2 to 6 inches in width, and of any thickness required: large quantities are yearly furnished for railroad purposes, and wherever used, its quality has been approved of. The establishment being large, can execute orders with great promptitude, at reasonable prices, and the quality warranted. Address

JOAN F. WINSLOW, Agent, Albany Iron and Nail Works,

## DAVENPORT & BRIDGES'

### CAR WORKS, CAMBRIDGEPORT, MASS.

Manufacture to Order, Passenger and Freight Cars of every description, and of the most improved pattern; also furnish Snow Ploughs and Chilled Wheels of any pattern and size. Forged Axles, Springs, Boxes and Bolts for Cars at the lowest prices.

All orders punctually executed and forwarded to any part of the country.

Our Works are within fifteen minutes ride from State street, Boston—Omnibuses pass every fifteen minutes. 10f

### THE HERRON RAILWAY TRACK,

As seen stripped of the top ballasting

A GOLD MEDAL AWARDED THE INVENTOR BY THE AMERICAN INSTITUTE.

**THE UNDERSIGNED RESPECTFULLY** invites the attention of Engineers, and Railroad Companies, to some highly important improvements he has recently made in the Herron system of Railway structure. These improvements enable him to effect a very large reduction in the quantity of Timber, and cost of construction, without impairing the strength of the Track, or its powers of resisting frost, while they secure additional features of excellence in the Drainage and facility of making Repairs.

The above cut represents the "Herron Track" as it is laid on the Philadelphia and Reading, and on the Baltimore and Susquehanna Railroads. The intersection of the sills of the trellis are 5 feet from centre to centre, while in the new construction they are only 3½ feet. This renders the string piece unnecessary, thus removing the only objectionable feature found in the Track.

The result of experience has proved that all Tracks constructed with longitudinal timbers, such as mud sills, and more especially, the continuous bearing spring pieces retain the rain water that falls between the Rails, which, being thus confined, settles along those timbers, and accumulating in quantity flows rapidly along them on the descending grades, washing out the earth from under the timber, and frequently causing large breaches in the embankments of the road. Whereas all water intercepted by the oblique sills of the trellis, is discharged immediately into the side ditches.

In the 5 foot plan, the Track occupies a Road bed nearly 11 feet wide, while the new construction takes

but 8 feet; the timber being more concentrated under the Rails. A block of hard wood, about 2 feet long and 15 inches wide, is introduced into a square of the trellis for the purpose of giving an additional, and effectual support to the joints of the Rails, which rest upon it. Should these joint blocks become chafed and worn by the working, and imbedding of the chairs, as is now the case on all Railroads, they can be readily replaced without any derangement of the timbers less liable to wear.

The following is a general estimate of its cost near the seaboard. In the interior it will be considerably less.

#### ESTIMATE OF THE PROBABLE COST OF ONE MILE.

4,934 Timbers, 11 ft. long, 3 x 6 inches =	
68,696 ft. b.m., at \$10 =	\$686 96
587 Oak joint blocks 2 ft. x 3 x 15 in. =	
4,403 ft. b.m., at \$13 =	57 24
13,000 Spikes = 2,250 lbs. at 4½ cts. =	101 25
Workmanship free of patent charge =	600 00

Cost of one mile including the laying of the Rail.....\$1,445 45

He has made other important improvements, which will be shown in properly proportioned models, that give a much better idea of the great strength of the Track than a drawing will do.

Sales of the Patent right to all the distant States will be made on liberal terms.

## AMERICAN RAILROAD JOURNAL.

OFFICE AT THE FRANKLIN HOUSE,  
105 Chestnut Street,  
PHILADELPHIA, PA.

This is the only periodical having a general circulation throughout the Union, in which all matters connected with public works can be brought to the notice of all persons in any way interested in these undertakings. Hence it offers peculiar advantages for advertising times of departure, rates of fare and freight, improvements in machinery, materials, as iron, timber, stone, cement, etc. It is also the best medium for advertising contracts, and placing the merits of new undertakings fairly before the public.

TERMS.—Five Dollars a year, in advance.

Passenger Depot in Philadelphia corner of Broad and Vine streets. 81y

## LEXINGTON AND OHIO RAILROAD.

Trains leave Lexington for Frankfort daily, at 5 o'clock a.m., and 2 p.m.

Trains leave Frankfort for Lexington daily, at 8 o'clock a.m. and 2 p.m. Distance, 26 miles. Fare \$1 25.

On Sunday but one train, 5 o'clock a.m. from Lexington, and 3 o'clock p.m. from Frankfort.

The winter arrangement (after 15th September to 15th March) is 6 o'clock a.m. from Lexington, and 9 a.m. from Frankfort, other hours as above. 351y

## BOSTON AND MAINE RAILROAD.

Upper Route, to Portland and the East.

SPRING ARRANGEMENT, March 1, 1847.

### PORTLAND TRAINS.

Leave Boston at 7 1/2 A.M. and 2 1/2 P.M.  
Leave Portland at 7 1/2 A.M. and 3 P.M.

### GREAT FALLS TRAIN.

Leave Boston at 4 1/2 P.M.  
Leave Great Falls at 6 1/2 A.M.

### HAVERHILL TRAINS.

Leave Boston at 11 1/2 A.M. and 5 50 P.M.  
Leave Haverhill at 6 1/2 A.M. and 4 P.M.

### READING TRAINS.

Leave Boston at 9 A.M. and 8 P.M.  
Leave Reading at 6 1/2 A.M. and 1 1/2 P.M.

### MEDFORD BRANCH TRAINS.

Leave Boston at 7 1/2 A.M., 2 1/2, 5 50 P.M.  
Leave Medford at 6 1/2, 8 A.M., 11, 5 1/2 P.M.

The Depot in Boston is on Haymarket Square.

Passengers are not allowed to carry Baggage above \$50 in value, and that personal, unless notice is given, and an extra amount paid, at the rate of the price of a Ticket for every \$500 additional value.

1y31

CHAS. MINOT, Super't.

**SUMMER ARRANGEMENT.—NEW YORK AND ERIE RAILROAD LINE,** from April 1st until further notice, will run daily (Sundays excepted) between the city of New York and Middletown, Goshen, and intermediate places, as follows:

FOR PASSENGERS—  
Leave New York at 7 A.M. and 4 P.M.  
" Middletown at 6 1/2 A.M. and 5 1/2 P.M.  
FARE REDUCED TO \$1 25 to Middletown—way in proportion. Breakfast, supper and berths can be had on the steamboat.

FOR FREIGHT—  
Leave New York at 3 P.M.  
" Middletown at 12 M.  
The names of the consignee and of the station where to be left, must be distinctly marked upon each article shipped. Freight not received after 5 P.M. in New York.

Apply to J. F. Clarkson, agent, at office corner of Duane and West sts. H. C. SEYMOUR, Sup't. March 25th, 1846.

Stages run daily from Middletown, on the arrival of the afternoon train, to Milford, Carbondale, Honesdale, Montrose, Towanda, Owego, and West; also to Monticello, Windsor, Binghamton, Ithaca, etc., etc. Agent on board. 13 if

## NORWICH AND WORCESTER RAILROAD.

Summer Arrangement, commencing Monday, April 6, 1846.

Accommodation Trains, daily, except Sunday. Leave Norwich, at 6 a.m., and 4 1/2 p.m. Leave Worcester, at 10 a.m., and 4 1/2 p.m.

The morning Accommodation Trains from Norwich, and from Worcester, connect with the trains of the Boston, and Worcester and Western railroads each way.

The Evening Accommodation Train from Worcester connects with the 1 1/2 p.m. train from Boston.

New York Train via Long Island Railroad: Leave Allyn's Point for Boston, about 1 p.m., daily, except Sunday.

Leave Worcester for New York, about 10 a.m., stopping at Webster, Danielsonville, and Norwich.

New York Train via Steamboat—Leave Norwich for Boston, every morning, except Monday, on the arrival of the steamboat from New York, stopping at Norwich and Danielsonville.

Leave Worcester for New York, upon the arrival of the train from Boston, at about 4 1/2 p.m., daily, except Sunday, stopping at Webster, Danielsonville and Norwich.

Freight Trains daily each way, except Sunday.—Special contracts will be made for cargoes, or large quantities of freight, on application to the superintendent.

Fares are Less when paid for Tickets than when paid in the Cars. J. W. STOWELL, Sup't. 321y

**CENTRAL AND MACON AND WESTERN** Railroads, Ga.—These Roads with the Western and Atlantic Railroad of the State of Georgia, form a continuous line from Savannah to Oothcaloga, Ga., of 371 miles, viz:

Savannah to Macon—Central Railroad ..... 190 Miles  
Macon to Atlanta—Macon and Western.....101

STOCTON & FALLS, Agents.

**RAILROAD SCALES.—THE ATTENTION** of Railroad Companies is particularly requested to Ellicott's Scales, made for weighing loaded cars in trains, or singly, they have been the inventors, and the first to make platform scales in the United States; supposing that an experience of 20 years has given a knowledge and superior advantage in the business.

The levers of our scales are made of wrought iron, all the bearings and fulcrums are made of the best cast steel, laid on blocks of granite, extending across the pit, the upper part of the scale only being made of wood. E. Ellicott has made the largest Railroad Scale in the world, its extreme length was one hundred and twenty feet, capable of weighing ten loaded cars at a single draft. It was put on the Mine Hill and Schuylkill Haven Railroad.

We are prepared to make scales of any size to weigh from five pounds to two hundred tons.

ELLICOTT & ABBOTT.

Factory, 9th street, near Coates, cor. Melon st.  
Office, No. 3 North 5th street, Philadelphia, Pa. 1y25

**GEORGIA RAILROAD. FROM AUGUSTA TO ATLANTA—171 MILES.** AND WESTERN AND ATLANTIC RAILROAD FROM ATLANTA TO OOTHCALOGA, 80 MILES.

This Road in connection with the South Carolina Railroad and Western and Atlantic Railroad now forms a continuous line, 388 miles in length, from Charleston to Oothcaloga on the Oostanaula River, in Cass Co., Georgia.

#### RATES OF FREIGHT.

	Between Augusta and Oothcaloga, 250 miles.	Between Charleston and Oothcaloga, 255 miles.
1st class. Boxes of Hats, Bonnets, and Furniture, per cubic foot.....	\$0 16	\$0 25

" " barrel.....	2 00	3 25
Salt per bushel.....	0 17	
Salt per Liverpool sack.....		95
Ploughs, Corn Shellers, Cultivators, Straw Cutters, Wheelbarrows.....	0 75	1 37

German or other emigrants, in lots of 20 or more, will be carried over the above roads at 2 cents per mile.

Goods consigned to S. C. Railroad Co. will be forwarded free of commissions. Freight may be paid at Augusta, Atlanta, or Oothcaloga.

J. EDGAR THOMSON,  
Ch. Eng. and Gen. Agent.  
Augusta, Sept. 2d, 1846. \*44 1y

**THE WESTERN AND ATLANTIC** Railroad.—This Road is now in operation to Oothcaloga, a distance of 80 miles, and connects daily (Sundays excepted) with the Georgia Railroad.

From Kingston, on this road, there is a tri-weekly line of stages, which leave on the arrival of the cars on Tuesday, Thursday and Saturday, for Warrenton, Huntsville, Decatur and Tusculumbia, Alabama, and Memphis, Tennessee.

On the same days, the stages leave Oothcaloga for Chattanooga, Jasper, Murfreesborough, Knoxville and Nashville, Tennessee.

This is the most expeditious route from the east to any of these places.

CHAS. F. M. GARNETT,  
Chief Engineer.  
Atlanta, Georgia, April 16th, 1846. 1y1

**PHILADELPHIA, WILMINGTON & BALTIMORE RAILROAD.—1847.**

Winter Arrangement.

Philadelphia for Baltimore... 8 a.m. and 4 p.m.  
Baltimore for Philadelphia... 9 a.m. and 8 p.m.

Connecting in Baltimore with Mail Lines south and west, as per notice of the Baltimore and Ohio Railroad—and with Mail Lines north from Philadelphia, both morning and afternoon.

Sundays, the Morning Lines do not run in either direction.

Accommodation train from Wilmington to Philadelphia, leaves Wilmington at 8 a.m., and returns at 2 p.m.

J. R. TRIMBLE,  
Engineer and General Superintendent. 2f

**LITTLE MIAMI RAILROAD.—OPEN** TO SPRINGFIELD—Distance 84 miles—

connecting at Xenia and Springfield with Messrs. Neil, Moore, & Co's. daily daylight lines of stages going east and north, to Columbus, Zanesville, Wheeling, Cleveland, and Sandusky City. via Urbana, Bellefontaine, Kenton, and the Mad river and Lake Erie railroad, or Columbus, Delaware, and the Mansfield and Sandusky City railroad—forming, by these connections, the cheapest and most expeditious route to Buffalo, Niagara Falls, Rochester, Albany, New York, and Boston.

On and after Thursday, August 13, 1846, until further notice, a Passenger train will run as follows: Leave Cincinnati daily at 9 A. M., for Milford, Foster's Crossing, Deerfield, Morrow, Fort Ancient, Freeport, Waynesville, Spring Valley, Xenia, Old Town, Yellow Springs, and Springfield.

Returning, will leave Springfield at 4 hours 35 minutes A. M. A line of Hacks runs in connection with the Cars, between Deerfield and Lebanon.

FARE—From Cincinnati to Lebanon...\$1 00  
" " " Xenia..... 1 50  
" " " Springfield... 2 00  
" " " Columbus... 4 00  
" " " Sandusky city 8 00

The Passenger trains runs in connection with Strader & Gorman's line of Mail Packets to Louisville.

Tickets can be procured at the Broadway Hotel, Dennison House, or at the Depot of the Company, on East Front street.

Further information and through tickets for the Stage lines, may be procured at P. Campbell, Agent on Front street, near Broadway.

The company will not be responsible for baggage beyond 50 dollars in value, unless the same is returned to the conductor or agent, and freight paid at of a passage for every \$500 in value over that amount.

The 1½ P. M. train from Cincinnati, and the 2 40 P. M. train from Xenia, will be discontinued on and after Monday, the 10th instant.

A freight train will run daily.  
W. H. CLEMENT, Supt. 47f

**SOUTH CAROLINA RAILROAD.—A** Passenger Train runs daily from Charleston,

on the arrival of the boats from Wilmington, N. C., in connection with trains on the Georgia, and Western and Atlantic Railroads—and by stage lines and steamers connects with the Montgomery and West Point, and the Tusculumbia Railroad in N. Alabama.

Fare through from Charleston to Montgomery daily.....\$26 50

Fare through from Charleston to Huntsville, Decatur and Tusculumbia..... 22 00

The South Carolina Railroad Co. engage to receive merchandize consigned to their order, and to forward the same to any point on their road; and to the different stations on the Georgia and Western and Atlantic railroad; and to Montgomery, Ala., by the West Point and Montgomery Railroad.

JOHN KING, Jr, Agent. 1y25

**RAILWAY IRON.—THE BEST QUALITY** of English Heavy H Rails—60 lbs. to the yard—now in store, landing from the vessel, and on ship board to arrive, for sale on most favorable terms by DAVIS, BROOKS & CO., Jan. 2. [14f] 68 Broad St., New York.

**TO RAILROAD COMPANIES AND MANUFACTURERS** of railroad Machinery. The subscribers have for sale Am. and English bar iron, of all sizes; English blister, cast, shear and spring steel; Juniata rods; car axles, made of double refined iron; sheet and boiler iron, cut to pattern; tiers for locomotive engines, and other railroad carriage wheels, made from common and double refined B. O. iron; the latter a very superior article. The tires are made by Messrs. Baldwin & Whitney, locomotive engine manufacturers of this city. Orders addressed to them, or to us, will be promptly executed.

When the exact diameter of the wheel is stated in the order, a fit to those wheels is guaranteed, saving to the purchaser the expense of turning them out inside.

THOMAS & EDMUND GEORGE,  
a45 N. E. cor. 12th and Market sts., Philad., Pa.

**T**HE NEWCASTLE MANUFACTURING Company continue to furnish at the Works, situated in the town of Newcastle, Del., Locomotive and other steam engines, Jack screws, Wrought iron work and Brass and Iron castings, of all kinds connected with Steamboats, Railroads, etc.; Mill Gearing of every description; Cast wheels (chilled) of any pattern and size, with Axles fitted, also with wrought tires, Springs, Boxes and bolts for Cars; Driving and other wheels for Locomotives.

The works being on an extensive scale, all orders will be executed with promptness and despatch. Communications addressed to Mr. William H. Dobbs, Superintendent, will meet with immediate attention.

ANDREW C. GRAY,  
a45 President of the Newcastle Manuf. Co.

**R**AILROAD IRON AND LOCOMOTIVE Tyres imported to order and constantly on hand by

A. & G. RALSTON  
Mar. 20tf 4 South Front St., Philadelphia. 38tf

**V**ALUABLE PROPERTY ON THE MILL Dam For Sale. A lot of land on Gravelly Point, so called, on the Mill Dam, in Roxbury, fronting on and east of Parker street, containing 68,497 square feet, with the following buildings thereon standing.

Main brick building, 120 feet long, by 46 ft wide, two stories high. A machine shop, 47x43 feet, with large engine, face, screw, and other lathes, suitable to do any kind of work.

Pattern shop, 35x33 ft, with lathes, work benches, Work shop, 86x35 feet, on the same floor with the pattern shop.

Forge shop, 118 feet long by 44 feet wide on the ground floor, with two large water wheels, each 16 feet long, 9 ft diameter, with all the gearing, shafts, drums, pulleys, &c., large and small trip hammers, furnaces, forges, rolling mill, with large balance wheel and a large blowing apparatus for the foundry.

Foundry, at end of main brick building, 60x45½ feet two stories high, with a shed part 45½x20 feet, containing a large air furnace, cupola, crane and corn oven.

Store house—a range of buildings for storage, etc., 300 feet long by 20 wide.

Locomotive shop, adjoining main building, fronting on Parker street, 54x25 feet.

Also—A lot of land on the canal, west side of Parker st., containing 6000 feet, with the following buildings thereon standing:

Boiler house 50 feet long by 30 feet wide, two stories.

Blacksmith shop, 49 feet long by 20 feet wide.

For terms, apply to HENRY ANDREWS, 48 State st., or to CURTIS, LEAVENS & CO., 106 State st., Boston, or to A. & G. RALSTON & Co., Philadelphia. ja47

**T**O RAILROAD COMPANIES AND BUILDERS OF MARINE AND LOCOMOTIVE ENGINES AND BOILERS.

PASCAL IRON WORKS.

**WELDED WROUGHT IRON TUBES**

From 4 inches to 4 in calibre and 2 to 12 feet long, capable of sustaining pressure from 400 to 2500 lbs. per square inch, with Stop Cocks, T, L, and other fixtures to suit, fitting together, with screw joints, suitable for STEAM, WATER, GAS, and for LOCOMOTIVE and other STEAM BOILER FLUES.

Manufactured and for sale by

**MORRIS, TASKER & MORRIS.**  
Warehouse 2 E. Corner of Third & Walnut Streets,  
PHILADELPHIA.

**T**O LOCOMOTIVE AND MARINE ENGINE Boiler Builders. Pascal Iron Works, Philadelphia. Welded Wrought Iron Flues, suitable for Locomotives, Marine and other Steam Engine Boilers, from 2 to 5 inches in diameter. Also, Pipes for Gas, Steam and other purposes; extra strong Tube for Hydraulic Presses; Hollow Pistons for Pumps of Steam Engines, etc. Manufacture: and for sale by

MORRIS TASKER & MORRIS,  
Warehouse S. E. corner 3d and Walnut Sts., Philadelphia 11f

**P**ATENT INDESTRUCTIBLE WATER Pipes. The subscribers continue to manufacture the above Pipes, of all the sizes and strength required for City or Country use, and would invite individuals or companies to examine its merits. This pipe, unlike cast iron and lead, imparts neither color, oxide or taste, being formed of strongly riveted sheet iron, and evenly lined on the inside with hydraulic cement. While in the process of laying, it has a thick covering externally of the same—thus forming nature's own conduit of stone. The iron being thoroughly enclosed on both sides with cement, precludes the possibility of rust or decay, and renders the pipe truly indestructible. The prices are less than those of iron or lead. We also manufacture Basins and D. Traps, for Water Closets, on a new principle, which we wish the public to examine at 119 Fulton street, New York.

J. BALL & CO.

Items from late English Papers.

**Legal and General Life Assurance Society.**—Having on so many former occasions called the attention of our readers to the increase of institutions for securing to the community the advantages of life assurance, and having ever endeavored to impress upon the mind the incalculable benefits which arise from its legitimate application, we need offer no apology for now calling attention to the above society, which has been established 10 years, and which has just arrived at the time appointed for making its first division of profits among the assured. At this, the commencement of a new period, the directors have determined to make some considerable alteration in the terms of assurance to which they had hitherto adhered, and considerably to extend the advantages commonly allowed to policy holders, convinced that they might be very much increased and enlarged with great benefit to all parties concerned. In all future assurances effected with this company, the age of the life of the assured will be admitted at the time of issuing the policy—so that the difficulties and delays occasioned by proving the age after death will be avoided. Individuals assured in this office will be allowed to pass by sea between any two places in the same hemisphere more than 33° from the equator, and to reside in Canada, New South Wales, Cape of Good Hope, Madeira, and any other place more than 33° north or south latitude. If an assured commits suicide, and the policy is vested in another, the money will be paid the same as on a usual policy; if by the party assured, a sum will be returned to the survivors equal to the entire amount of premiums paid; and in case of death by duelling, or by the hands of the law, the amount of the policy will be also paid. The benefits, to be attached to future policies, have been extended to all existing policies. These are certainly advantages: and their concession shows that the directors are men of business, fully alive to the change which is gradually taking place in the principles which hold society together, and that they will rather anticipate, than be behind in the great march of liberality and enlightenment.

**The Thames Economical Steamboat Company.**—Among the numerous undertakings for the investment of capital, which the year 1847 is likely to see brought before Parliament, is the above, formed for establishing safe, convenient, and economical steam communication from London bridge, both up and down the river, upon an equalized scale of fares, in proportion to the distance each passenger may have to go. Steamboats of the most approved construction will be built, and so arranged, that while they afford relief from a hot summer, shelter will be afforded from rain, and plenty of cabin room provided. A peculiar feature in the prospectus, and one which we think bids fair to place the company in a first rate position, is the construction of powerful barges for the conveyance of heavy merchandize to and from the various vessels lying in the river, docks, quays, warehouses, etc., which barges will be built on such a principle, that they can be employed

as steam-tugs, for the purpose of towing heavily laden barges, etc., to all parts of the river. In this portion of the business, we observe they are already patronized by a very large number of merchants, factors, boatbuilders, wharfingers, etc., on the river; 150 of whom have already expressed their intention of supporting the company, on such suggestion being carried out. It is, therefore, proposed immediately to construct 15 boats for these purposes; and the engines will be on Mr. Fell's patented principle for the generation of steam, by which one fifth of fuel is saved, and it creates an immense power in a few minutes, without the least danger of explosion. The capital is to be £200,000, in 40,000 shares of £5 each, and each shareholder is to receive free passage tickets to the full amount of his subscription. A well regulated system of fares, according to distance, will, most probably, in connection with commodious boats, be an attractive feature in this scheme; but, there is no doubt, that the steam barges will pay well, whether used as vehicles of carriage or as tugs for other barges; and it is evident that merchants, lightermen, and others, will find it to their interest to employ them, from the immense saving which must result to them in the time occupied in the transit.

**Miners' Strike, Hours of Labor and Remuneration.**—We have received a letter from a correspondent, who signs himself "A Colliery Bailiff," dated West Bromwich, in reference to the contemplated strike of the miners of the South Staffordshire district for a reduction of the hours of labor, for which notice was given a fortnight ago. The writer points out very clearly and sensibly some of the evils of these "turn outs," and the nature of the occupation and remuneration of those who are employed in the working of coal mines. We give the statement as it has been sent to us, without, of course, being able to vouch for all the particulars therein stated. He says: "In working the thick coal mines there are two sorts of workmen, viz: pikemen or fletters, who work by the piece or stent, and bondmen or loaders, by the ton or day. The pikemen have to cut a certain portion, according to the seams or measures, for a day's work of 5s.; and it is very common for them, in the space of eight or nine hours, to cut from one and a half to three of these portions or stents, or so many times 5s. and the bondmen, when working by the day, from 6 a.m. to 6 p.m. with meal time out, have 5s. 6d. per day, and when by the ton, will get from 7s. to 8s. Each man in the pit is allowed two quarts of drink per day, and one ton of coals per month. Pikemen seldom work more than three turns in the week, and the bondmen four days, thus taking their own time for recreation, on which plea a strike is called for. It is with difficulty that they can be got to work even this time; since their wages have been advanced to the present prices, there is less work done; and it is a lamentable fact, that these useful men, instead of devoting their attention and a portion of their time to their domestic and social improvement, spend it in drunkenness, gaming, dog fighting, pugilism and such like,

which are more injurious to the constitution than the gases in the mines. With respect to the unhealthiness of their occupation, it is the general opinion that colliers are less liable to disease than mechanics, and there numbers in this district who have attained a good old age. Those gases which are most injurious are seldom lodged in the working part of the mines, where the ventilation is attended to, accidents and loss of life only occurring when they are recklessly entered into. Now as regards these strikes, they originate with some of the most idle and lazy, who scarcely ever work in one colliery many days, and are constantly going to and fro, until discarded by most. They then begin to agitate in clubs, lodges, etc.: and not the least of the evils which follow is the driving of the trade from the district, and the increase of poor rates, for as soon as the colliers leave off work they begin to beg, and leave their families to seek for themselves. The result of this state of things is a suspension of works, manufacturers unemployed, shopkeepers and householders obliged to pay advanced prices for coal; and to the coal master and iron master an increase of royalty, rates, taxes, etc., follow. This ultimately brings on a panic, such as followed the strike of 1842. It is to be hoped, that the steady and thinking portion of the colliers will ponder well on the consequence of the step they are about to take, and not be led away by the lazy or designing, who have their own objects to serve, and who would adopt any scheme rather than work for an honest livelihood.—*Birmingham Journal.*

**Iron Vessels.**—We must not forget the very important improvement in the introduction of iron from the destruction of vessels, which enables us to combine lightness and elegance of form with strength and durability. For this valuable addition to marine architecture, we are indebted to Aaron Manby. In 1820–21 he constructed at Horseley, near Birmingham, a wrought iron boat, called the *Aaron Manby*, 120 ft. long and 18 ft. beam, and when laden drawing 3 ft. 6 in. water; it was propelled by Oldham's feathering paddle wheels, worked by a single engine of 80 horse power; and was built for the purpose of plying on the river Seine. The boat was completed in 1821–22, and was navigated across the Channel by the present Sir Chas. Napier, who was deeply interested in the undertaking; it was not only the first iron vessel that ever made a sea voyage, but also the first that conveyed a cargo from London to Paris direct, without transshipment. She continued plying between Paris and Havre for several years, until superseded by other more powerful and improved boats: the hull is yet in existence, and is still used with new engines on board, as are three others, which were built about the same time. In 1831 Maudsley and Field built four iron vessels for the East India Company, for the navigation of the Ganges, and fitted them with oscillating engines, of the united power of 60 horses; they were 120 ft. long, 24 ft. beam, and drew 2 ft. water; they were so successful that six more were ordered shortly afterwards. The

use of iron, however, did not make much progress until recently, on account of the prejudices and obstacles which generally, if not invariably impede the progress of all great inventions. At present, iron is much employed for vessels, and promises in many cases to supersede timber. Objections against its general employment have been urged, on account of the bottoms of the vessels being liable to become foul on long voyages; and for the purposes of war, the splinters of the iron when struck by shot are said, from recent experiments, to be more detrimental than from wood. The art of building iron vessels is, however, in its infancy; and it is very probable that further experience and investigation will, in a great measure, obviate the evils. The strength, lightness, and other qualities that have been mentioned, give it great advantages for the construction of fast sailing passage vessels; and the water-tight bulkheads constructed with it, give great additional security in case of accidents; these water-tight bulkheads are now almost universally adopted; but the precise date and origin of their introduction is not very clear. Captain Evans, of Holyhead, proposed them for timber vessels in the year 1826, and soon after that time they were used in an iron vessel constructed by Grantham for C. W. Williams, Esq. Examples of their importance have frequently occurred, demonstrating the necessity of their introduction into all vessels, whether for river or sea navigation.—*Sir John Rennie.*

**Hemp and Flax Manufacturing Company.**—We have on various occasions noticed the measures which are being taken for the re-establishment, on a more extensive basis, of the company, formed some years since at Rugeley, in Staffordshire, for the manufacture of hemp and flax of all countries, under an entirely new process, patented by Mr. Doulan. Although extensively advertised, the greater number of the shares are taken up by parties connected with the existing company: the business generally has been arranged and managed by J. Simpson, Esq., of 25, Moorgate street; and it may now be said to be brought to a successful issue, as applications have been made for a much larger number of shares than was originally contemplated, and the allotment is expected to take place in a week or ten days. The invention is one of considerable importance, as establishing the manufacture of an article far superior to any previously produced; and which, while it reflects the greatest credit on the inventor's ingenuity, has so far, and is likely still more so, under the employment of an extended capital, to make an ample return for the investment.

**Solders for Brass and Copper.**—The *Dictionnaire Technologique*, a French work of great value in the arts, recommends the following mode of making solders for brass. Two kinds of solders are used for this purpose, the hard and the soft. The hard is made in the following way: take 16 parts of brass and 1 of zinc, melt the brass in a crucible, and also heat the zinc. When the brass is melted the zinc is thrown hot into

the crucible, which is then covered, and the whole well shaken together. In about two minutes, pour the metal through the twigs of a birch broom, placed over a proper vessel of water. The metal by this process is divided into small grains, after which it is well washed and kept for use. The proportions may vary from those given to two parts of brass and one of zinc. A *hard solder* for copper is made by the above process, only substituting copper for brass in the proportion of eight parts of copper to one of zinc. This makes quite a fusible solder, which is at the same time malleable; ten parts of copper and one of zinc make a harder but less fusible solder. The *soft solder* for brass is made of six parts of brass, one of zinc and one of tin. The brass is first melted, the tin is then added, and lastly the zinc, which last metal should be first well heated, then shaken and divided as above directed.

**Mineral Wealth of England.**—In the course of a lecture delivered yesterday to the general classes of King's College, by Mr. Tennant, on mineralogical geology, the lecturer stated that the annual value of the mineral produce of England amounts to about £25,000,000. Of this 9,000,000 is from coal, 8,400,000 from iron, 4,200,000 from copper, 920,000 from lead, 400,000 from salt, 390,000 from tin, 60,000 from manganese, 35,000 from silver, 22,000 from alum, 8,000 from zinc, and 55,000 from the various other metals, as antimony, bismuth, arsenic, etc.—*London Times.*

#### Ventilation of Coal Mines.

The vast importance of a system of perfect ventilation being applied to our collieries, and the positive proofs which the late fearful calamity at Oldbury, with the almost countless explosions which have preceded it, give us that the present methods of working coal are founded in error, render every suggestion worthy of notice, more particularly when it comes back by long experience and scientific acquirements. We have received a pamphlet from the pen of Mr. B. Gibbons, of Shutend House, near Dudley, dedicated to Philip Williams, Esq., a magistrate of Staffordshire, and an extensive proprietor of mines—in which the author, we verily believe, approaches nearer to the great desideratum than any of the numerous, but futile, plans, which have been so often paraded before the public, but which have proved to be as far as ever from a correction of the evil. Written in an unassuming and intelligible style, the author takes the hourly operations of Nature for the basis of his system, common sense for the means of application, and explains his premises with this homely illustrations which all may understand. First, ascertaining the cause of the generality of these alarming accidents, and the insufficiency of the present means of ventilation, to keep up constantly and in one direction the necessary current of air, he suggests a remedy founded on the most simple, yet scientific, laws, and which we shall now endeavor to explain to our readers. To show the difficulties in an attempt at the removal of local prejudice, he says, that when he first descended the thick coal pits, 45 years

ago, he found the gate road and the air head driven side by side on the floor of the mine: it struck him that this must be wrong; and, after much patience, and more by authority than persuasion, he succeeded in raising the air head so much, that the bottom of it was on a level with the top of the gate road: since that period he has climbed 6 ft. higher, or about the middle of the coal, and he still hopes to get to the top. By this method he has succeeded in opening the coal—so that it is now perfectly free from gas in every part of the workings. Having shown that the quantity of air for the supply of men, horses, and candles, should generally greatly exceed 40 cubic feet to one of carburetted hydrogen evolved, he protests, *in limine* against all artificial means of obtaining ventilation, whether by air pumps for forcing air in, or exhausting pumps for drawing it out, or even the furnace at present so generally in use, which, however, in some cases, may prove an useful auxiliary; but he deprecates all power which is not self acting. We now come to the details of his plan. A colliery is to be established where the coal lies at the depth of 140 yards; the first step is to sink two round pits or shafts (say) 7 ft. diameter each, down to, and through, the stratum of coal, 30 ft. in thickness; the gate road, or horse way, is then to be driven in the bottom of the coal 9 ft. wide and 8 ft. high, commencing from the bottom of the downcast shaft. At the same time, or rather before, as it should always be a little in advance of the gate road, an air way is commenced for the upcast shaft about the middle of the coal, or 15 ft. high from the floor; this gate road and air way are then driven in parallel lines for 180 or 500 yards, according to the quantity of coal intended to be cleared, and spouts or openings are to be driven from the gate road upwards into the air way, at from 10 to 15 yards, according to the quantity of gas given out. Having arrived at the furthest point at which it is intended to get the coal, the gate road is driven at a right angle to its former direction, still accompanied by the air way; and, when it has proceeded 10 or 15 yards, to pass thro' a rib, to be left for the support of the road and air way, the excavation is stopped—the preparatory measure for making a side of work about an acre, or taking away the whole stratum of coal, then begins; and now we come to the important part of the system, which is to ventilate all these roads and headings, and a cavity containing more than 1,000,000 cubic feet of space, and also carry off all the gas incessantly issuing from the coal. The coal is now undermined, and dropped down in large masses, until 15 feet in thickness have been removed, when the air way is reached, up to which period the air has descended the downcast pit, travelled along the gate road, ascended to the air way, which it has traversed, ascended the upcast pit, and, carrying with it all the gas and vapors, delivered them into the open air. Having removed this 15 ft. of coal, the air way is no longer of use—in fact, no longer exists; and every cavity above becomes a reservoir of gas. In fact, it may be estimated at 400,-

000 ft. of hydrogen floating on the air beneath. He now shows that, if it were possible to bring the whole of this to the firing point at one moment, the consequences would be too fearful to contemplate; but as portions of the gas become sufficiently charged with air, explosions follow in succession. To overcome the danger, a current of air must be compelled to enter, and clear out every cavity formed; and this current must move in one and the required direction, and have sufficient force to overcome all extraneous forces, either of wind or change of atmosphere, copious enough to neutralize the gases produced, and leave sufficient for men, horses, and candles; but these conditions cannot be fulfilled under the present system, and, even if a sufficient current was obtained, it would be useless, so long as the up and downcast pits are used in working shafts. The upcast, which is the main air way, ought always to be closed from the external air, and guarded from disturbance, to prevent the slightest interruption to the current; it is however, often kept in constant commotion by the ascent and descent of skips loaded with coal, which nearly fill the shaft. A carriage, called the runner, is also drawn over the mouth at every landing of a skip, and thus completely cuts off the current; but when a rope or chain breaks, the skip rapidly descends, and forces the gas in the workings down upon the workmen's candles. Having completed the workings as far as described, a chimney, 60 to 90 ft. in height, is to be erected, and put into communication with the upcast shaft; the top of this chimney being in an atmosphere of much less density than that of the workings, or even at the surface, a certain, constant and self-acting draught is obtained.

The work contains some diagrams of different forms of shafts, by which one can be made available, having a recess of 4 ft. square on one side for the air chimney or upcast, which one man could carry down, and keep pace with the sinking, and cast iron cylindrical curbs, with a segment divided off for the air way for sinking in sandy strata. Mr. Gibbon has adopted the lofty stack, in connection with the upcast pit, for 25 years;—and which, to increase the draft, may be raised to 120 ft., and even higher; in every case he has been completely successful—the thick coal abounded with gas, but is now so completely drained, that all difficulties have vanished, and the men have no such thing as a safety lamp in his pits. A great improvement has taken place in their health; and in his King Swinford pits the air is generally 62° to 64° Fah.; while in neighboring pits under the old system, it is from 74° to 78°—the former the temperature of a comfortable sitting room, the latter that of a heated cotton mill. Here, then, is a system certainly new to us; but which, from the properties and laws by which the movements of the permanently elastic fluids are regulated, is evidently founded on scientific principles, and would, doubtless, in every case where prejudice did not intervene, prove as successful as in the author's. We most sincerely recommend his little work to the attention of coal own-

ers, and all interested in the rescuing so many thousands of our fellow-creatures from the dangers which surround them; and, though the author, much to his credit, has evidently published it not for sale, but for gratuitous distribution, we have no doubt but all connected with collieries would obtain one on application. We cannot close without one extract on a subject on which we have often animadverted—viz: the crying deficiency of being destitute of a Mining College. He says—“If these few observations should have the effect of quickening such a movement, I shall think myself richly rewarded by this alone, for the trifling trouble this little book has given me; I have endeavored to be brief, and my object has been to write in such language as will be best understood by all. I have felt myself called upon to point out the practical means which experience has disclosed to me, as best calculated to abbreviate (at least) the frightful list of suffering which humanity recoils from; I also felt that it was discreditable to a trade (containing in its ranks so many intelligent men) to realize before the world, the fable of ‘the Carter and Hercules,’ and, like the former, call aloud for that assistance from the government, which must at last emanate from themselves.”

#### Progress of Continental Steam Engine Manufacture.

The rapid strides which engineering science has made in this country, within the last 20 years, has raised a spirit of emulation among the principal mechanics in France and Belgium, to endeavor to approach, at least somewhat nearer to that superiority which has been here attained, and which, had it not been for the near-sighted policy which at one time prohibited the exportation of all machinery, would have established England as the machinery mart of the whole continent of Europe. Unable thus to obtain our engines, and which they could not imitate, hundreds of our best mechanical workmen were enticed by the engineers of France and Belgium, at exorbitant wages, not only to undertake the fabrication of engines on the English plan, but to instruct foreign workmen in their art; and it was this importation of British science into Belgium, that raised the fortunes of Cotterell, of Seraing. The English restriction was soon repealed; but the mischief had been done; for, notwithstanding the vigilance of the custom house, not only men, but models and castings to a large extent, continually found their way across the Channel. Among the most celebrated engine manufactories in France, are the establishments of Hallette, of Arras, and Schnieder, of Creuzot, who have gained their renown at the expense of British science and industry; and many of the most celebrated manufacturing engineers on the continent have Englishmen for their foremen and best artisans. From a report of M. Jobard, director of the Belgian Museum of Industry, made to M. Thieux, Minister of the Interior, after an industrial tour through the south of France and Switzerland, it appears that Mulhausen may well be termed Manchester in miniature; there are here several large works for the manufacture of

steam engines, principally on the expensive principle. One is a joint stock company, in which 600 men are employed, who turn out a locomotive engine every week, at a cost of £2050, while Ridder, of Belgium, charges but £1000. One of the three large stationary engines for the atmospheric railway, from Paris to St. Germain, was made at this company's works, one at Hallette's, and the third at Seraing. Mulhausen also contains numerous factories for tools and implements, and power cotton mills, employing a working population of 36,000 persons daily. At Thun and Zurich there are also very extensive factories of steam engines, particularly at the latter city, in which is the large house of Zocher, Weyss, & Co., who are famous for colossal water wheels, for applying to advantage the numerous water falls with which Switzerland abounds. These facts show the policy it would be for the continental governments to reduce the restrictions on British iron—a metal, the cheap and easy attainment of which forms the very basis of the progress of science. We have no doubt Belgium will be the first to set the wise example: of France we have no hope, until the people become aware of the cost of iron monopoly, and when absolute scarcity shall cause the pressure from without to force the repeal of the duties from a reluctant government—the tools of the ironmasters.—*London Mining Journal.*

#### English Iron Trade.

The correspondent of the *London Mining Journal*, furnishes the following remarks in regard to the Iron Trade:

Business commenced this year under considerable difficulties, arising from the tightness of the money market, which was experienced more or less in all parts of the world, especially in India—the demand from whence having been thus decreased, added still more to the depressing influence.

Iron, though not the subject of such extensive speculations as in the preceding year, has yet occupied a prominent position in the metal market, and sales, both for exportation and especially for home consumption, have transpired to a large extent. The price of rails in January last, was £12 10s. to £13, at which rate about 35,000 tons were sold; from a slight decrease in the demand, and the forced sales of speculators, the price fell £1 10s. to £2, until it reached £9 5s. to £9 10s., at which rate about 10,000 tons exchanged hands; it recovered about 10s., at which a sale of 20,000 tons for America were reported. Since which, the price has ruled £9 10s. to 9 15s., free on board; sales, some of which are of very great extent, are continually occurring at these rates, and makers generally are full of orders. The price is expected to go higher from this, as well as other causes, especially the difficulty of procuring coal, and the present scarcity of ore. Bar, though at times subject to a trifling depression from natural causes, has yet been well maintained by the incessant demand for home consumption; it is now held firmly at £9 15s. to £10 in London, and higher prices may be expected.—Scotch pig commenced the year at 80s. for No. 1, at which considerable business took

place; prices since then have continually fluctuated, but not to such an extent as to warrant any very extensive speculation: it has at times, it is true, receded as far as 66s. to 67s. 6d., but the general aspect was so uncertain that few could venture upon it; it has, however, within the last two or three weeks manifested such unequivocal symptoms of revival, that a better spirit seems to pervade the minds of dealers, sales at improving prices are constantly reported, and accounts from both Liverpool and Glasgow report the gradual and steady advance of rates. The article is extremely scarce in the London market. No. 1 may be quoted 76s. to 77s. 6d., mixed No. 74s. to 75s. cash. Should a reduction of the duty in France take place, which is highly probable, a fresh stimulus will be given to the pig iron trade. Welsh and Staffordshire pigs are in good demand, and makers generally are busy; several large parcels in speculators' hands have been sold for consumption.

#### Accidents on the Worcester Railroad.

A series of collisions took place on the Worcester railroad on Wednesday afternoon by which three or four persons were injured, four locomotives were disabled, and several cars smashed. The Albany train which had been delayed for some reason or other, came in contact with a gravel train which was backing up the track, and the engine of the former was considerably injured, though no person was hurt. The men on the gravel train, about 30 in number, all jumped off before the collision. Before he jumped off, the engineer of this train reversed the engine, but the force of the shock set it going again, and it started off down the track at full speed, ran a distance of 7 miles to the 35th mile post, without any one to guide it and then stopped just at a curve, where the 4 o'clock train from this city ran into it, not seeing it until about 100 feet from it. Both engines were considerably damaged. A message was sent to Westboro' to detain the steamboat train and another to Worcester, and Mr. Moody, depot master at W. immediately set to work to clear the South track, which has been undergoing repairs, and on which there were placed several freight cars to be out of the way.

As soon as matters could be cleared up, the steamboat train took the 4 o'clock train in tow and proceeded towards Worcester, with instructions to the engineer to proceed slowly and with caution, but just as it passed the bridge in Worcester, the speed having been increased, it came in contact with some of the freight cars above mentioned, which were on the track, sufficient time not having elapsed to enable the workmen to remove them all. Here the most melancholy part of this series of accidents, occurred. The engine and two of the passenger cars were much injured, and Mr. Flint, one of the road hands, was so severely hurt that he died of his wounds about midnight. Mr. Page of Methuen, a passenger, was badly bruised. R. K. Porter, brakeman on the boat train, had his leg broken, and several other persons were somewhat hurt. Mr. Dana, depot master in this city, left with a special train at 11 o'clock last night, carrying with him Dr. Winslow Lew-

is, but as there was no need for his services he returned immediately.

We learn from the Courier that the conductor of a freight train on the Western railroad, which left Worcester about two o'clock yesterday afternoon, fell from his train soon after starting, and was almost instantly killed by the concussion. The train immediately stopped, and before it could get out of the way an inward bound train came in collision, and both engines were much injured.

From the Portland Advertiser.

#### Androscoggin and Kennebec Railroad.

The organization of the Lewiston and Waterville Railroad Company took place at Winthrop on the 5th inst. It was undoubtedly the most numerous attended railroad meeting ever held in Maine, and the enthusiasm and unanimity that pervaded all its measures have been without any parallel as far as we have known, in relation to any similar enterprise.

The meeting for organization was appointed to take place at 1 o'clock in the afternoon of the 5th inst. But on the evening of the 4th, a numerous body of the stockholders from Bangor and several of the principal towns in Penobscot county as well as from Somerset, Franklin and Oxford, and a still greater number from Cumberland, Lincoln, and Kennebec were present.

An informal meeting of the stockholders was held at 9 o'clock A. M. of the 5th, and a full and very animated discussion was had upon the various questions coming before the stockholders.

Messrs. Boutelle of Waterville, Morrill of Readfield, S. P. Benson of Winthrop, Taylor of Fairfield, and Goodenow of Portland, were appointed a committee to prepare and report By-Laws for the action of the stockholders.

Messrs. Morrill of Waterville, Prescott of Farmington, Bachelier of Readfield, Small of Portland, and Brown of Portland, were appointed a committee to examine the subscription books, and make return of the amount of the stock taken in the several towns.

The committee on By-Laws made a report, in which they recommended, that the number of Directors be fixed at 9—the charter allowing the stockholders to fix the number at 7, 9 or 13.

A motion was then made to strike out 9, and insert 13. This gave rise to an animated discussion, in which Messrs. Poor, Little, Judge Preble and Goodenow of Portland, and Prof. Champlin and Mr. Boutelle of Waterville, G. A. Benson of Winthrop, and Taylor of Fairfield participated, and the amendment was adopted without a count, and the report accepted as amended.

The committee on the stock subscription then reported, that on the subscriptions returned, (two being absent) 8750 shares had been subscribed, and 5 per cent advance paid in. It was afterwards voted that the books be kept open during the day, and shares were subsequently taken up to a considerable amount.

It was then voted that the same committee apportion to the several counties their number of Directors, who finally reported that the Directors be taken as follows:

- 1 from Penobscot county.
- 1 from Franklin "
- 1 from Lincoln "
- 2 from Somerset "
- 5 from Kennebec "
- 3 west of the Androscoggin river.

The stockholders from the several districts, after they returned, named their candidates as follows:

Timothy Boutelle and Jedediah Morrill, Waterville; Samuel P. Benson, Winthrop; Lott M. Morrill, Readfield; Renben B. Dunn, Wayne; Josiah Prescott, Farmington; Samuel Taylor, Jr. Fairfield; John Ware, Athens; W. B. S. Moor, Bangor; Josiah Little, Jr., Lewiston; John Fox and William Goodenow, Portland; Hobart Clark, Andover, Mass.

The forenoon was consumed in a very brisk and spirited discussion of the various matters connected with the railroad, while the crowds of people who flocked into town during the forenoon, gave the streets the appearance of an 1840 mass meeting.

The stockholders were organized at Carr's Hall,

by the choice of Edward Little, Esq., of Lewiston, as Chairman, and John Goodenow of Auburn, as Clerk, and adjourned to the Rev. Mr. Thurston's Meeting House, which, in anticipation of their adjournment, had been filled to its utmost capacity long before the appointed hour. The By-Laws reported were unanimously adopted.

The committee having reported names for the thirteen Directors, a ballot was taken and 6204 shares were represented, and the gentlemen before named were severally elected, with scarcely a dissenting vote.

Mr. Moor, of Bangor then offered a resolution responding to the proposition or resolution adopted at the Bangor mass meeting, favoring an union at Waterville of the Androscoggin and Kennebec and Penobscot and Kennebec railroad companies, by which a continuous line of railway from Bangor to the Atlantic and St. Lawrence railroad should be secured. After a full and able speech from Mr. Moor, explaining the position of affairs at Bangor, and remarks from several other gentlemen, the question of passing the resolution was taken by rising, and carried by acclamation and without a dissenting voice.

Several gentlemen then came forward, asking permission to take further stock, and an exciting debate sprang up on the subject, while the subscription was going on.

#### Lamp without a Wick.

Few will hesitate to admit that if a lamp can be so constructed as to support a clear flame without the use of any wick whatever, it must be an important invention; and such is the principle of an invention, a description of which is given by the inventor as follows:—

"The fluid to be burnt is put into any suitable reservoir for holding it. This reservoir is placed above, and a little one side of the point where it is to be burnt. From this reservoir, there is to be a pipe, which is to project downwards and turned or bent out horizontal. At the end of this pipe there is to be a short glass tube set in. The top of this tube is enlarged into a cup-like form, and sets up perpendicular in it. The pipe which this is set into has a faucet valve in it, the same as in a gas pipe. This valve is to open and close the connection between the reservoir and glass tube. When the fluid is to be burnt, the valve is opened to allow the fluid to pass through it into the glass tube, up to its surface. It is now to be closed until the fluid in the tube is fired, when it is opened enough to allow it to pass through as fast as it will burn without smoking. By turning the valve it regulates the passage of the fluid to give more or less light, as in a gas pipe valve. The shape of the cup part of the tube may be of any suitable form, to give the air a free chance to combine with or support the combustion of the burning fluid, and of a size suited to the amount of light required.

"I have tried the principle with oil and it burns equally as clear and bright as with a wick, and will give any amount of light required; and I see no reason why it would not be an advantage, for it would be less work to keep them in order than lamps with wicks. It would be inconvenient to apply it to hand lamps; but where the lamps are fixed or stationary, as in street and light houses lamps, for which latter use it would be a good advantage, for the fluid could be conveyed through one main pipe to as many burning points as required, and give a given amount of light all night, if the reservoir be sufficient above the burning points."

Correspondents will oblige us by sending in their communications by Tuesday morning at latest.

### AMERICAN RAILROAD JOURNAL.

Published by D. K. MINOR, 105 Chestnut St., Philadelphia.

Saturday, March 13, 1847.

### MISSING NUMBERS OF THE RAILROAD JOURNAL.

Subscribers, who wish to obtain Missing Numbers of Back Volumes of this Journal, will do well to apply BEFORE the 1st of APRIL next, as, after that period, they cannot be obtained!

### BOUND VOLUMES.

Volumes of this Journal, for the Years 1838 to 1846, INCLUSIVE, may be had Bound, at Subscription Price, on application at this Office.

One or two COMPLETE SETS of the RAILROAD JOURNAL may be had in a few weeks—or as soon as two numbers can be reprinted—by application to the Editor.

### TABLE OF AMERICAN RAILROADS.

We have at length completed our long-promised Table of American Railroads. The delay has been much longer than we supposed it would be; yet it will, we trust, be found the more complete by the delay.

By referring to the Table, it will be found to contain a mass of information difficult to be obtained elsewhere, in a condensed form.

The name of the road—its termini—the year when opened—its length—cost—the form and weight of rail—number of tracks—number of inclined planes—highest grade—least radius of curvature—fare per mile—commutation by the season—gross and net revenue and dividends for 1845—are given according to the most authentic documents within our reach; and, in addition, copious notes of reference, explanatory, showing the various connections, etc., are given.

Notwithstanding that much time and research have been devoted to this Table, we are fully aware that, in many cases, the facts—as they now exist—are not accurately given: as there is a constant and progressive change in the condition of most railroads. We therefore have to request each of our readers—and especially those having the management of railroads—to send us by mail, at an early day, the correction of any errors which they may detect in the table, that we may issue a second and corrected edition of it. A little attention and labor on the part of engineers and superintendents of railroads, will enable us to complete the work here commenced, and to furnish, to all who desire it, a mass of useful information, exceedingly difficult to be got at now, even by the most devoted friend of the cause—and we shall therefore keep the "form" standing for two months—thus giving ample time for—and in hope of—receiving returns from every part of the country.

### Opening of the Pennsylvania Canal.

The Pittsburg Gazette of 27th ult. says: "Should no untoward change in the weather occur, we understand that the canal commissioners have given orders to commence letting water into the Western Division on the 3rd or 4th of March. The process will doubtless be a very cautious one, as it is unprecedentedly early. The line is in perfect order, and a few days of drying weather would render it quite secure. Business will now commence in a few days, and we find our transporters all ready to commence operations."

### Railroad from Lake Michigan to the Mississippi.

A western exchange, in a lengthy article upon the subject of a railroad from Lake Michigan to the Mississippi river—holds the following language:—"The importance of railroad communication between the different sections of our country, is becoming more and more appreciated. The eastern cities are deeply interested in facilitating intercourse between themselves and the great western valley.—The opening trade with the west is but commenced. The tide of emigration towards those rich and vacant lands is constant; and millions of acres are yet to pour their harvest into the commercial emporiums of the east. The most expeditious channels of intercourse between the east and west will command the passengers and much of the trade. The great western railroad, extending from New York and Boston, will pass on the south shore of Lake Erie, thence across the peninsula of Michigan and round the head of Lake Michigan to Chicago. From this point is the only uncommenced or perhaps unsurveyed part of the route between the great lakes and the father of waters. The completion of a railroad from Chicago to the Mississippi, will consummate the connection between New York, Boston and New Orleans, by an expeditious inland route. The attention of eastern capitalists is invited to the feasibility and importance of this work. By an examination of the map of Illinois, it will be perceived, that directly west of Chicago, the Mississippi makes its great eastern bend, and approaches nearest the Lake. This is the easiest and most natural connection. It is not only the shortest, but the most practicable. It passes through the most beautiful and inviting part of Illinois—one that will require but little grading—settled by an industrious and thriving population, and affording every facility for making a road, and abounding in all the products of the northern and middle States.

A continuous railroad between Lake Michigan and the Mississippi may be made with comparatively little expense. The importance of this route is prospectively great. A railroad from Chicago directly west to the eastern bend of the Mississippi will concentrate to one point the northern and southern travel. It will not only greatly facilitate the intercourse between Iowa and the east, but by extending a branch north to Galena, following the grade of the Great Central road, the lead trade may be secured. With another extending down the Mississippi to Rock Island, and ultimately below the lower rapids, where the navigation of the river is uninterrupted for the greater part of the year, it will most certainly become the great channel of communication between the west and south and the eastern cities—embracing the most valuable and important sections of our country. Shall Boston or New York first adventure in this magnificent enterprise? Shall a large part of the Mississippi valley be thus brought into immediate commercial alliance with one part of the east? Great advantages may be secured—

who shall win them? The rival cities in this great enterprise are New York and Boston."

### Railroads, Bridges, the Canals, etc.

The extended and extensive business upon the Western Railroad, has induced the company to put measures in progress for increasing the capital to \$10,000,000 and lay a second track on the road.—This company has labored under serious disadvantages on account of the monopoly between Boston and Worcester, but this road has been exceedingly productive nevertheless. It would not be surprising if a majority of the stock of the Boston and Worcester should ere long be in the hands of the stockholders of the Western: such an event would materially enhance the value of the Western stock.

The Albany correspondent of the Rochester Democrat says the stock for the construction of the Niagara bridge is all taken. The capital is \$200,000. Half of it was subscribed in Canada and the balance mostly in New York and Philadelphia.

Contractors in Philadelphia and Pittsburg offer to build a good substantial bridge of wire for \$200,000. It will be 40 feet wide—the centre track for cars to connect with the Canadian road through to Detroit, and capable of transporting 300 tons over it at once, at a rate of 10 miles to the hour. There will be two tracks for carriages and a foot path. It will have three spans with abutments 200 feet high. It is supposed it can be completed in two years, which will make it ready for use by the time the Canada road is completed.

Ohio, Indiana, and Illinois are moving in favor of a railroad from St. Louis to the Ohio river. The Ohio Legislature offer the right of way free of charge. The City Councils of St. Louis have memorialized the Legislature of Missouri, for permission to subscribe half a million of dollars to the stock of a railroad to run from that city eastwardly to join such other railroads as may be distributed through the States of Illinois, Indiana and Ohio.

The silver greys are waking up to the importance of a railroad communication between Newburyport, Mass., and Lowell direct, via Georgetown, Bradford and Andover. The estimated cost of the road to Bradford (opposite Haverhill) is \$200,000, of which a large portion is already subscribed. At Bradford the road will intersect with the Boston and Maine railroad which passes through north Andover; whence a branch may be constructed to Lowell via the new city of Lawrence.

The Harrisburg Intelligencer learns that the Canal Commissioners are making every exertion to open the canals by the 1st of March, and that, if no freshets should occur to produce breaches, they are confident that the several lines will be in order for transportation from the 1st to the 10th of March, certainly not later than the last mentioned day.

It is with much gratification that we announce that by the promptness and enterprise of the citizens of New York and the principal river towns, the entire required capital for the Hudson River Railroad was promptly subscribed in season; and that the public may now anticipate with confidence the early completion of a thoroughfare by which a citizen of New York may take his seat at 7 A. M., visit Albany, spend two hours in business or calling on friends, and return to the city in season for tea, not to say dinner.

According to present appearances the Norwich and Worcester Railroads will be extended to New London without long delay. The New Londoners are wide awake to the enterprise, as well they may be. It would be the first great and good thing ever accomplished for that city, and many of the citizens,

even of Connecticut, would soon learn that New London is within the limits of the State. It is proposed to take up all of that road now extending from Norwich to Allyn's Point, and lay the whole of it on the western side of the river Thames, commencing from Norwich and running to New London.—One hour's time will be gained by the operation by passengers to and from Boston or New York. The cost of the improvement is estimated at \$300,000.

The stockholders of the Portland, Saco and Portsmouth Railroad Company, have voted to sell their railroad to the Eastern Railroad and the Boston and Maine Railroad Companies, for a perpetual annuity of six per cent. on the capital paid in.

We have frequently noticed "new inventions" and improvements in railroad cars and machinery, which have appeared as "new inventions" only, not having been applied to practical use. We learn from the Boston Post, that Messrs. Butterfield and Cutting have now exhibiting in that city, an improvement that promises to be of great utility. The editor says—The principle is a *self-detacher*, which is applied to each car; and in case of any obstruction on the road calculated to throw the engine off the track, or raise the wheels, each car is instantly detached from the other by the operation of a self-acting lever, thereby saving the passengers harmless. Connected with this improvement is another, denominated a *sparkler*, which can be fitted to an engine, and is intended to prevent sparks or cinders from passing out of the smoke pipe and annoying the passengers. We understand that the Eastern Railroad Company intend to make immediate application of these inventions to their engines and cars, and from a hasty examination of the models, we think they are admirably calculated to remedy the evils for which they are intended.

The Newburgh branch of the Erie Railroad is progressing in good style. We learn that the work on the whole line is in a state of forwardness, and with the exception of a mile or two at this end of the route, will be graded by the middle of next summer.

The whole stock of the Central Railroad, says an exchange, "has been subscribed for, and several hundred shares over. This road which is to connect Pittsburg with Philadelphia, is an enterprise of much importance to the public in general as well as to Philadelphia in particular. The citizens of Pittsburg have imbibed some degree of prejudice against this route, on account of the opposition manifested by the Philadelphians against the Pittsburg and Baltimore route: but as this circumstance has had the effect to secure both charter and subscriptions to the Central road, the Pittsburgians will be ready to share its benefits."

#### Boston vs. New York.

A late number of the New York Journal of Commerce contains some statistics which go to show pretty convincingly that the "City of Notions" is treading hard upon the heels of her great rival, "Gotham"—and that Boston is fast outstripping New York in the western trade, by means of the railroad to Albany. The singular success of this road is known to all. It has astonished and alarmed the good people of Gotham, who, relying on their great natural advantages, looked formerly with contempt on this enterprise—never dreaming, any more than the Venetians of old, that so large a part of their old established business could be wrested from them and retained. The history of this road is without a parallel. It presents the singular spectacle of a railway 202 miles long, with two summits—one of 1400 feet above tide, the other 918 feet, and

with grades of 83 feet per mile—competing with the steamboat navigation of the world renowned Hudson, a distance of 52 miles less than the railroad! The bearing of this fact on certain questions now agitated in our own community, will be evident to all. "The Western railroad," says Mr. Roebling, a distinguished engineer, in a paper lately read before the Pittsburg Chamber of Commerce, "presents a most forcible argument in support of this new doctrine, that the best water communications are destined to become subservient to railroads, for travel as well as freight. I draw your attention to this question: if the Hudson river, between New York and Albany, the best steamboat navigation in the world, 150 miles in extent, is not capable of commanding the trade and travel exclusively, in competition with a railroad of over 300 miles long, from Albany to Boston, with two high summits and objectionable gradients, what may be expected of the success of steamboat navigation on the upper Ohio, in competition with a railroad will located and with moderate gradients. Freight is carried by steamboats at the rate of from two to five cents per 100 lbs. per 100 miles. This is at the rate of from 40 cents to \$1 per ton per 100 miles. Coal is transported from Pottsville to Philadelphia by railway at less than \$1 per ton per 100 miles. But whether steamboats charge a few cents more or less, will little influence the transport of the great west, while the saving of transshipment and commission, and the certainty, rapidity and safety of conveyance, are of much greater moment to the merchant and the traveller."

Annexed are the statistics from the Journal of Commerce. Whoever examines them will not be surprised that the New Yorkers regard Boston as a powerful rival in the great fields of commercial and general enterprise. Well may they be jealous; for Yankee shrewdness and energy are "hard to beat," under any circumstances, and there is a prospect that at no distant day they will allow the great city of Gotham to share the sceptre but equally with the metropolis of New England. Not only has Boston by a bold stroke appropriated to herself a rich share of the western trade, to secure which New York expended \$30,000,000 on her canal, but she has wrested from her the most brilliant part of her commercial glory, in monopolizing the grand enterprise of ocean steam navigation. It is but fair to add, however, that New York is rousing at last to a sense of her situation, and has just subscribed \$3,000,000 to the Hudson River railroad, by which she hopes to retrieve her losses:

"Has Boston, since she, with her usual enterprise and sagacity, introduced her iron fingers into the vital source of our internal commerce, been gaining on us in general prosperity or not?"

"I begin with the year 1841, (that in which the railroad from Boston to Albany was opened,) and contrast it with the past year, 1846.

"I take personal property first.

Boston.		New York.	
1841—	\$36,043,600	1841—	\$64,843,979
1846—	58,730,000	1846—	61,740,470

Gain,	\$22,675,400	Loss,	3,373,502
or 63 per cent.		or 5 1-5 per ct.	

"Next as to that of real estate.

1841—	\$61,963,000	1841—	\$187,350,948
1846—	90,119,600	1846—	183,480,931

Gain,	\$28,156,600	Loss,	3,870,017
or 45 1/2 per cent.		or 3 per cent.	

He tells the proprietors of real estate in New York that,

"Their buildings and vacant lots were worth

\$187,000,000 in 1841; in the intervening five years they have certainly expended \$25,000,000 on them, (and more probably \$30,000,000) in replacing old buildings with more appropriate structures, and erecting new buildings on vacant lots; and yet, with all this absorption of current means, their estates as a whole are not worth as much by \$4,000,000 as they were in 1841."

#### Macadamized and Plank Roads.

We have been favored with the following well written communication, from the pen of a gentleman who has had much experience in road making, to which we would call the attention of our readers. Macadamized roads are deserving of more attention than they have received in this country; and we are therefore the more desirous to call attention to the subject. By referring to the early volumes of the Journal, it will be seen that this subject was not overlooked by us at that early day—though it has since been, to a great extent, by the public.

We are obliged to the writer for this, and shall look with interest for his promised article on plank roads.

For the American Railroad Journal.

In a late Railroad Journal I perceive some remarks upon "Plank roads," and I also observe that it is intended to form some such roads, in particular localities, in some parts of the United States, where they are but little known.

I have long been a subscriber to your Journal, and am glad of an opportunity of acknowledging my obligations to its columns, for a great deal of valuable information on the construction as well as the statistics of railroads, and upon many other useful subjects, and I do not know how I can make a better return, than by conveying to you, and to your readers, a practical description of Plank roads in Canada, and of Macadamized roads both in Canada and in England. I wish I could add of railroads also; but, alas! we have not any in Canada of which to give their history. The writer of this communication came out from England to Canada in 1832, with the especial object of introducing an improved system of making roads, having been so employed for many years in England, and bringing with him letters of introduction and recommendation from some of the principal members of the British Government to Sir J. Colborne.

At the period alluded to, April, 1832, there was not in Canada a mile of road made upon, I may say, any system; the consequence was, that even within the first mile of the Capital of Upper Canada, then called Little York, in wet weather the road was one continued mud hole, through which it was difficult for a team of horses, or a yoke of cattle, to draw an empty wagon; the largest load on a wagon, when the roads were in their best state, from the respective mills, within ten miles of the town, was six barrels of flour, and it was difficult to go and return the same day. In the fall of 1832, at the then Governor's suggestion to Parliament, a mile of Macadamized road was ordered to be made as an experiment—the inhabitants, never having seen such a road, could not believe in its asserted superiority and permanency; the mile was made, and from the peculiarly unfavorable nature of the soil, the absolute necessity of perfect drainage, the cost of the stone, which consisted wholly of granite boulders, the total inexperience of the population of the knowledge of stone breaking and spade labor, and the exorbitant demands of the few persons who had stone on their lands, this mile cost £2000. This metal bed, it should be remarked, was 30 feet wide, and the metal laid 11 inches thick; expensive as it was, it has proved itself to be the very best piece of road in Ca-

nada, and literally for six or seven years had no repairs made upon it.

The road was made on principles somewhat different, and as it is believed, superior to those since made by the Canadian Board of Works. The metal "bed" was formed very solidly, 11 inches deep within the abutments, and it was exactly of the shape of the road when finished, that is rising in the centre, (or barreled technically) six inches in a road 20 feet wide, and four inches when the width was narrowed to 16 feet. The stone was broken so as to pass through a two-inch ring, or in the absence of one, any stone that could not be put into the stone breaker's mouth was considered too large. Up to the present time in 1847, there are but about 18 miles of this road (the Young Street road,) completed.

The next piece of Macadamized road was made in 1837-8, from Kingston to Nappance, a distance of 24 miles, which including bridges all of solid masonry, and cutting down hills, mostly solid lime stone rock, cost on the average about £3000 currency per mile.

About the same time, six miles of Macadamized road were constructed from Brockville on the Perth road, and which cost about £1300 per mile. This road passed over a bed of solid lime stone rock, and there was very little cutting; the stone was taken from the ditches.

Twelve miles were also made from Hamilton towards Beauford, which from the difficulty of ascending the mountain, and other engineering difficulties, cost about £2500 per mile.

No other Macadamized road, strictly so called, has been made in Canada West; about 20 miles of gravelled road was made between Beauford and London, which cost, including grading, about £800 per mile; the stone on this road was only 12 feet wide, and principally constructed of gravel screened and laid down as it came from the gravel pit, except that the large stones were broken and laid on six inches thick with a flat metal bed.

These are all the Macadamized roads made in Canada West up to the present time.

**Practical Remarks upon Constructing Macadamized Roads.**—The great desideratum is draining, and by draining is meant not merely taking off the water into side ditches, but also in constructing tap or off-take drains, by which no water is permitted to stand in the side ditches; and not only so, but where springs break up in any part of the road between the ditches, they must be carried into the side drains, so that the metal bed is always kept perfectly dry. French drains must also be made use of as outlets from both sides of the metal bed through the abutments leading into the ditches: these drains are usually made diagonally, so as to get a better descent; they are about one foot wide, and rather deeper than the metal bed, and serve to carry off the water which falls on the road, and passes through the metal bed, before the materials are become solid. Common observers are not aware, that where a road is not properly drained, if you dig a hole in it the water will rise to its natural height, if not immediately, it will in a short time, and to place broken stone upon a wet clayey surface, would be like putting shot into a batter pudding, it would soon go to the bottom.

Except near cities and towns, 14 feet is sufficient for the metal bed, and the two abutments each 10 feet, and then the side ditches will occupy each six feet wide on the surface, with banks sloping one to one and two feet deep, will give a roadway 46 feet wide, leaving on each side for foot ways, etc., eight or nine feet to the bush.

Near large cities, it will be desirable for a mile or

two, to make the metal bed either 18 or 20 feet wide.

The depth of the metal bed should be at least nine inches, and the broken stone should be as near as possible all of one size; nothing is so erroneous as to put large stones at the bottom and small ones on the top; suppose the road to be made of cannon balls and small shot, if the large balls do not come to the top, the small shot would pass between them to the bottom, leaving the heads of the large ones to form a rough and dangerous road.

The size of the stones for ordinary roads should be as before described, but for roads little used, or for light weights, they will make a hard road much quicker by being broken smaller, say half the size.

A road comparatively little used proves a very useful road if the metal bed is only eight feet wide and six inches deep; a large amount in construction is saved, and it has been found that carriages in breaking out to allow others to pass, even if heavily loaded, do not make a deep rut on the natural soil; the truth is, that the abutment of the road becomes hard from not being frequently disturbed, and carriages seldom break out twice exactly in the same spot.

**Blinding.**—This means laying on to a newly made piece of road, earth, sand, gravel, etc.; a difference of opinion prevails upon the expediency of this practice. The only advantage of it, and it is no small one, is that it presents a much earlier and a much smoother surface to a newly made road, and consequently saves a vast amount of animal labor, till the road in its natural state becomes solid.

Its disadvantages are, that it prevents the stones uniting by their angles, "the essential principle of a Macadamized road;" it makes a muddy surface in wet weather, and a very dusty one in dry weather; and nothing is so destructive as water to a well made road, as it occupies the hollow places, and forms the nucleus of a future and a very destructive mud hole, and what is perhaps worse than anything else, as the materials used for blinding will always have some clayey matter in them, which is an absorbent of water, the frost gets into it, and by its expansive force, drives the stones apart from one another, and thus makes a loose quaggy road in the spring and fall, and a shifting sandy road in dry weather.

The advocates for blinding are not aware that a Macadamized road made on sound and scientific principles will begin to become concreted at the bottom, and gradually become hard towards the surface; this is effected by the small fragments of stone broken off by the action of the wheels or the iron shoes of the horses, which, passing through to the bottom layer of the metal bed, fill the interstices and makes a hard body, which process goes on till the whole becomes a solid compact mass. There can be no doubt, therefore, that roads made without blinding will be much more solid, will throw off the water, will not be so easily affected by frost, and be far more durable than a blinded road.

Nor has it been generally known that the durability of a well made Macadamized road, is not more dependant upon the material used, than it is upon the nature and structure of the metal bed. If the stones are evenly broken and evenly laid on, by spreading with shovels, as a malster spreads malt on a floor, and all heaping avoided, the stones by uniting by their own angles, and confined by good abutments, the road partakes of the nature of an arch; and it has been proved in practice, that when the metal bed is become well compacted together, a tunnelled drain may be safely made down the middle without endangering the falling in of the road; all these minute particulars are therefore obviously

important in the construction of a Macadamized road; and it will be seen by any practical man, that while an attention to them is highly advantageous, the additional expense is comparatively trifling.

A Macadamized road, with a metal bed 16 feet in width and 10 inches in depth, will in practice require about 330 toise of broken stone, of 260 feet to the toise, per mile.

The cost of stone necessarily varies in different parts of the Province; in the Western District, as well as in parts of others, there is literally no stone for many miles together.

Where granite boulders are numerous, they may be collected on the side of the road at \$8 per toise; where they have to be carried a considerable distance, the cost will be higher in proportion; a toise of granite boulders weigh from eight to ten tons, according to the shape and size of the stone, a solid cubic foot weighs 180 to 185 lbs.

Where limestone formations exist near the sides of a line of road, the quarrying will cost from five to seven shillings the toise, to which must be added five shillings for throwing upon the road. They will with the breaking at eighteen shillings, furnish a supply of stone at \$5 the toise, which is the lowest possible price at which stone can be procured here.

The price paid for breaking granite boulders is from 30s. to 36s. the toise; for breaking lime stone, from 15s. to 20s., according to its hardness. An expert hand will, however, earn at these prices large wages, from \$1 50 to \$2 per day; an inexperienced or lazy man will not earn half a dollar.

The best Macadamized roads are those which are made of three parts granite and one part lime stone or sand stone.

The cost of ditching, draining, grading, forming the abutments and making the metal bed, under ordinary circumstances, may be estimated at about £400 the mile. This is, however, independent of lowering hills, building bridges or large culverts, or cutting extensive lateral drains, the cost of which, when necessary must be added.

The cost of lowering hills will depend upon their elevation, nature of the soil, whether rock or otherwise; the cost of bridges on the width of the streams, and the nature of the foundation, proximity of materials, etc. Taking 20 miles together in Upper Canada, probably £200 per mile may be a fair estimate for lowering hills and building bridges; this is however necessarily vague and altogether dependant upon circumstances.

A great deal of money has been wasted in pursuing a straight line over hills; a better as well as a cheaper road can be generally made by skirting a hill. It is no farther round the side of an orange than it is over the top of it.

A very mistaken practice has prevailed in Canada in the method of repairing Macadamized roads.

It has frequently happened that before an experienced engineer has completed his work, or probably when he has made a mile or two only, his services are dispensed with, and his place occupied by some one whose services can be obtained at a cheaper rate, (and not unfrequently by one of his foremen,) who is altogether ignorant of the first principles of road making, and wholly destitute of experience, or of the necessary practical or scientific knowledge requisite for either making or repairing roads.

The consequence is, that from want of proper attention the road is allowed to become "rutty," and from the unequal settlement of the metal there are many hollow places, which, if not properly managed, or injudiciously repaired, produce a loss of reputation to the engineer, while the public sustain the

double inconvenience of having to travel on a bad road, and of encountering the heavy expense of heaping on a quantity of new material which raise the road too high in the middle, and at a cost twenty times greater than the charge of occasional inspection by a competent and experienced engineer.

The labor of one man will keep in repair three miles of well made and well drained Macadamized road for the first two years after its formation, and for miles for the two years after that—by constantly raking the loose stones into inequalities of the road, and by also raking into the middle from the sides those which have been forced up by the constant pressure of heavy weights in the centre, scraping off the mud, opening water courses, etc.

During the fifth year the road may require to be "lifted," that is (technically) picking up with a sharp well-stepped pickaxe about two inches in depth of the solid metal bed, and spreading it evenly over the entire surface. This will cost about 9d. per running yard. The lower parts of the bed having become a solid mass, equally hard throughout, if this operation be well performed, the road will be better than ever it has been, perfectly free from inequalities on the surface, and will bid defiance to any weather or to any loads which may be drawn upon it, without fresh material for at least two years longer; when, if the metal bed from its wear has become thin, a covering of two inches of new material may be laid on.

The following is a calculation of the cost of an ordinary mile of road, without taking into account lowering hills, building bridges, engineering, compensation for land, toll gates, etc.:

330 tonne of stone delivered on the side of the road, at £2.....	£660
Breaking 330 tonne at 30s. per tonne.....	495
Forming, ditching, draining, etc.....	400
	£1,555

The following is a calculation of the cost to the public of a Macadamized road for a period of eight years, upon the most moderate scale on which such a road can be constructed in any part of Upper Canada, west of Kingston:

	Original cost of a mile of road as before stated..	£1,555 00
End of 1st year.	Cost of repair.....	20 00
	One year's interest.....	90 00
		110 00
2d year.	Cost of repair.....	20 00
	One year's interest.....	99 08
		119 08
3d year.	Cost of repair.....	15 00
	One year's interest.....	107 09
		122 09
4th year.	Cost of repair.....	15 00
	Interest.....	113 09
		128 09
5th year.	Cost of repair, by lifting 1760 yards, at 9d.....	66 00
	Interest.....	121 10
		187 10
6th year.	Cost of repair.....	20 00
	Interest.....	132 11
		152 11
7th year.	Cost of repair.....	20 00
	Interest.....	141 11
		161 11
8th year.	Repair by a coating of new material two inches, requiring 66 tonne stone, at £3 10.....	231 00
	Interest.....	151 12
		382 12
	The entire cost of the road to the public at the end of eight years.....	£2,919 10

\* Fractional parts of interest are not calculated.

Under the mode of management before described, it is assumed that the road will be as good as new at the end of this period.

JAMES CULL, Civil Engineer.  
Kingston, C. W., February 23, 1847.

#### Miscellaneous.

**Fall River Railroad.**—A proposal has been started for the extension of the Fall River railroad through Central Dorchester to Boston. We understand that a strong interest is manifested in Randolph and along the line of the proposed road. We learn, however, that a sufficient amount has been subscribed to ensure the completion of the branch roads already chartered from the Old Colony road to the Quincy quarries and to Milton and Dorchester. The construction of these roads will operate with two fold advantage to the Old Colony road, by securing the travel from those sections and ensuring the Fall River road to the Old Colony as a perpetual branch. We notice that a meeting of citizens of Randolph is to be held next Monday for the furtherance of the project of the Independent route. Why this should be, we cannot well understand. Randolph and the Fall River road are now sufficiently accommodated over the track of the Old Colony road. The Fall River road was originally intended as a permanent and perpetual branch to the Old Colony road; for these ends it was chartered; the branch roads about to be constructed from the Old Colony to different points on the line of the proposed Independent route, will sufficiently accommodate the travel of those sections and render the scheme of the Independent route entirely impracticable.—*Quincy Patriot.*

**New Railroads.**—A project has lately been started at New London to build a piece of road to connect that place with the city of Norwich. The whole cost is estimated at \$300,000. It is believed that by this route a full hour's time will be saved in the journey from Norwich to New York.

The railroad from Worcester to Nashua is already under contract, and being an easy route can be built in twelve months, and then New London will be connected with the Nashua, Concord and the northern railroads, by a continuous line of about 130 miles in length, intersecting the Worcester and Western roads. At Worcester a mammoth depot is to be built, for the accommodation of five roads, viz: the Worcester, Western, Norwich, Nashua and Providence.

**A Great Bridge.**—The railroad bridge over the Susquehanna river at Harrisburg, just finished by the Cumberland Valley railroad company, is an immense structure. The entire length of the bridge is 3,992 feet. It is built upon an improved lattice plan, the invention of Mr. Kirkpride himself, there being two double and two single segments of lattice. There are 23 spans, averaging 173 feet, and 2 arched viaducts, one 53 feet, and the other 84 feet long. There are two carriage ways, above which, immediately under the roof, is the railway track.

**Iron Ore in North Adams.**—Extensive and inexhaustible deposits of iron ore have been discovered within a few months, in North

Adams, Mass., where a furnace for the manufacture of pig iron has recently been established. The sum of \$50,000 has been expended in the necessary buildings and apparatus, and the proprietors are now making 4 tons of iron a day, of a good quality.

**Use of Grapes.**—Dr. Underhill strongly advises the culture of grapes, both on account of the profit to be derived from the sale of them, and from their value as food to sick and convalescent persons. At a late meeting of the New York Farmer's Club, Dr. Underhill made some highly valuable observations on this subject. After 15 years' trial with various kinds of grapes, he prefers some of our natives, and recommends the Catawba and Isabella. He has three acres of the former and seventeen of the latter. He says our people eat too much animal food, which renders their blood too thick, and causes diseases of the heart, liver and lungs. He thinks it would be infinitely better to substitute grapes and other fruit, for a portion of animal food.

**Chinese Artesian Wells.**—The Chinese apparatus for boring wells is thus described. It consists of a heavy bar of cast iron six to ten feet long, and from four to six inches in diameter: the lower end furnished with a boring tool combined with a motion pipe, and which is suspended by a rope passing over a large pulley fixed over the bore holes. This weight is wound round a windlass, and the whole is so contrived that the weight may fall from any required height. The tension given to the rope produces a circular motion, sufficient to change the place of the cutting tool at each descent.

**Steam Frigate Sidon.**—The engines of the British mammoth steam frigate Sidon, above the water level, are entirely made of malleable iron, or of brass metal, in proportions of composition similar to gun metal, and equally hard as the best iron, to resist the action of the shot should they be struck during warfare. The expansion gear is worked by tappets below, and the shaft is perfectly clear of any trapping. Vacuum pumps are used instead of springs or balance weights. The Sidon has also a patent reeling paddle wheel, the floats of which are regulated by those on deck, to suit the changes in draft of water according to the weight on board the vessel at the time.

**Wood Screw Machine.**—A valuable improvement in the manufacture of wood screws is noticed in the Brooklyn Eagle. The editor says: "It does its work in the most rapid and effectual manner of any bit of machinery we ever saw. By the plan hitherto, each screw had to be taken singly and put through the various operations requisite to its perfection. But the machine in question does the work by wholesale! It works its own way, too; is susceptible of the application of steam power, and can be taken care of by one-tenth the usual attendance. Another advantage is its simplicity of construction; it is not complicated at all, which all mechanics know is a great beauty of engineering." This machine is entirely of American invention, and seems to us calculated to increase the re-

putation of our country for inventing many of the best, cheapest and most profitable applications of power to machinery, used in any manufactures in any land."

**Magnificent Project in England.**—A company, with a large capital, are engaged in the erection of twelve hundred houses for the use of the laboring classes, who are to be conveyed back and forth from home to their daily toil by the railway. It is also in contemplation to erect villages at convenient distances from all large cities and towns, to which the working classes can travel every morning and return home at night without costing more than is now expended for badly ventilated and unhealthily-located dwellings for the poor under the present system.

**Alarming Railroad Accident.**—An accident of a most alarming character occurred on Wednesday last, about 11 o'clock, A.M., to the downward train of cars on the Tonawanda railroad, about a mile from Bergen, N. Y., the particulars of which are as follows: The engineer, it appears, discovered that the axle of the tender was broken, and immediately endeavored to arrest the engine. The train consisted of a baggage car, one passenger car, nearly filled with passengers, and fourteen heavy freight cars, loaded with wheat in bulk. The immense weight and impetus of the freight cars, the train being at its greatest speed, rendered unavailing all efforts to stop the train; and the passenger car together with eight of the freight cars, was thrown off the track, and precipitated some fifteen feet down the embankment. The passenger train fell nearly with its bottom up, and the freight cars burst through the bottom, breaking the passenger seats and crushing everything in their way. No life was lost, nor was any one dangerously injured: a result which seems little short of miraculous. Several were slightly hurt, and none wholly escaped from bruises. The passengers, after the utmost confusion and alarm, succeeded in extricating themselves.

**Decomposition of Steam.**—Mr. G. Gurney states, from experiment, that steam under high pressure is partially decomposed, and that in a state of gaseous vapor, it is capable of heating the iron flues to such an extent that linen is charred, gunpowder fired and metal is fused by it. Mr. G. suggests the use of fusible metal in some part of the pipes as a preventive of fire, for, melting when the flues become too highly heated, it will allow the escape of the vapor, and, of course, assist in cooling the pipes.

**Coal vs. Calico.**—It is estimated that the amount of capital employed in manufacturing at Lowell is a trifle more than *ten and a half millions* of dollars. The board of trade of Philadelphia in noticing this fact, boast that the capital now invested in bringing the coal of Philadelphia to market, is *thirty four millions* of dollars. It is hardly fair to put the whole of the great state of Pennsylvania against a single town in little Massachusetts. But there is another aspect in the state of their trade, of which they may speak with pride. The whole sum expended by government since 1804 for roads, fortifications, harbors

and rivers, say the board, does not much exceed *seventeen millions*, which is but half the sum expended by Pennsylvania in constructing avenues to bring one of her chief staples to market.

**A Great Bridge.**—The new railroad bridge across the Susquehanna at Harrisburg, is an immense structure. It is about four thousand feet long, built upon the improved double lattice plan. There are twenty-three spans, averaging one hundred and seventy-three feet each; and two arched viaducts, one fifty-three feet, and the other eighty-four feet long. The entire cost of this immense structure is short of \$100,000.

**Waterford Manufacturers.**—In the small village of Waterford, Saratoga county, there is the largest fire engine manufactory in this country. Twenty-four fire engines were made here last year, twelve hose carriages, 10,000 feet of leading hose, and 500 feet of suction. Nothing but fire engines are manufactured by Mr. Button, and orders are supplied by him to every part of the U. States, with a satisfaction, we have been informed, which won for him a prize of \$500 in Massachusetts, and was, with a liberality deserving much encomium, immediately made a present of to the fire company that got his machine, and was victorious in the contest. Waterford is quite a smart manufacturing village. Mr. Gage's machine shop is famous for the manufacture of slide lathes and printing presses. Here also is the well known button manufactory, so much indebted to the genius of that celebrated mechanic, Mr. Barton, whose biography we trust we shall soon be able to present to the readers of the *Mechanics' Journal*. There is also the linen twine manufactory of Mr. Beardsley, producing a great amount of shoemaker's thread and warps for coarse carpets. There is also a foundry in this place, and a number of grist mills. Waterford is situated on the banks of the Hudson and Mohawk, and is well adapted for manufacturing except in times of high water, which from the nature of its location produces what is called back water on the wheels, and either stops their movement altogether, or much diminishes their speed. The only remedy for this is a steam engine to be used in such cases, and which has been successfully and economically used in a number of places, such as at the Lodi foundry, Syracuse, and at the Rochester railroad machine shop.—*Mechanics' Journal*.

**Peterboro' Railroad.**—A meeting of the Stockholders of the Peterboro' and Shirley Railroad Company was held at Townsend, on Tuesday last, for the purpose of passing upon the location of the road, previous to filing of the same with the county commissioners. A majority of the stock subscribed was represented, and the location as reported and explained by Mr. Parker, the Engineer, was unanimously approved and confirmed. Authority was given to the Board of Directors "to make such alterations in said lines as may be deemed necessary and for the interest of the company."

The work of grading this road is going on with much activity, and it is expected that it

will be completed before the coming in of August. At a meeting of the Directors, same day, further assessments on the stock were laid, payable on the 10th of April, 1st and 15th of May, and if these are promptly paid, as the previous ones have been, the entire road may be ready for the cars in October.—*Bunker Hill Aurora*.

**Ogdensburg Railroad.**—A meeting of the Directors of the Ogdensburg Railroad Company, we understand, is to be held in the city, on the 15th March, at which Mr. Hayward will submit his report of his recent surveys. This report, we learn, will be of the most favorable character, as to the results of the survey. A highly eligible route has been obtained with grades no where exceeding 26 feet to the mile easterly and 40 feet to the mile westerly—a good country through which to build a road—abundance of good material and very little rock cutting. The prospect of this road, in the important matters of construction and business, are of the best possible description. It can be built at a cost probably lower than that of any New England road, and of its legitimate and certain business, no reasonable estimate can now be made. The Directors, no doubt, will take some decided measures to have the construction of the road put under contract, as soon as it may be done. The people on the line of the road, who have subscribed liberally to its capital stock, are anxious to see the work commenced, and we hope their expectations will soon be realized. Northern New York, to say nothing of the immense country north and west, ought to be opened to the business and population of Boston.—*Bunker Hill Aurora*.

#### Kennebec Railroad.

We learn from the Portland Advertiser, that the engineers upon the Kennebec and Androscoggin railroad, have found a practicable spot to cross the Androscoggin just above the falls at Lewiston, which will save about one half of the expense of constructing the bridge over that river, upon the estimate first made by Mr. Hall when crossed at a different point.

We also learn that the working survey has been extended to Greene, and the route found more favorable than anticipated.

We congratulate the friends of the road upon this favorable commencement of the work, and as the crossing of the valley of the Androscoggin was the most difficult part of the route, this survey to Greene settles the question as to this road being constructed at a very cheap rate as compared with other roads. The subscriptions in the various towns are going on, and the amounts raised in some towns double nearly the sum anticipated.

**RAILROAD IRON.—THE "MONTGOMERY" Iron Company,** Danville, Pa., is prepared to execute orders for the heavy Rail Bars of any pattern now in use, in this country or in Europe, and equal in every respect in point of quality. Apply to **MURDOCK, LEAVITT & CO.,**

Agents.

1y48

77 Pine St., New York.

**RAILWAY IRON.—DAVIS, BROOKS & Co.,** No. 68 Broad Street, have now in port on Ship-board, 200 Tons of the best English heavy H Rails, 60 lbs. to the lineal yard, which they offer for sale on favorable terms, also, about 6 to 700 Tons now on the way, to arrive shortly, of the same description of Rail.

**NICOLL'S PATENT SAFETY SWITCH** for Railroad Turnouts. This invention, for some time in successful operation on one of the principal railroads in the country, effectually prevents engines and their trains from running off the track at a switch, left wrong by accident or design.

It acts independently of the main track rails, being laid down, or removed, without cutting or displacing them.

It is never touched by passing trains, except when in use, preventing their running off the track. It is simple in its construction and operation, requiring only two Castings and two Rails; the latter, even if much worn or used, not objectionable.

Working Models of the Safety Switch may be seen at Messrs. Davenport and Bridges, Cambridgeport, Mass., and at the office of the Railroad Journal, New York.

Plans, Specifications, and all information obtained on application to the Subscriber, Inventor, and Patentee, **G. A. NICOLLS,** Reading, Pa.

**RAILROAD IRON.—THE SUBSCRIBER'S** New Rail Iron Mill at Phoenixville, Pa., is expected to be ready to go into operation by the 1st of September, and will be capable of turning out 30 to 40 tons of finished Rails per day. They are now prepared to receive orders to that extent, deliverable after the 1st of October next, for heavy rails of any pattern now in use, equal in quality and finish to best imported.

**PIG IRON.**—They are also receiving weekly 150 to 200 tons of No. 1 Phoenix Foundry Iron, well adapted for light castings.

**REEVES, BUCK & CO.,**  
45 North Water St., Philadelphia,  
or by their Agent, **ROBT. NICHOLS,**  
79 Water St., New York.

**THE SUBSCRIBERS, AGENTS FOR** the sale of  
Codorus,  
Glendon,  
Spring Mill and  
Valley, } Pig Iron.

Have now a supply, and respectfully solicit the patronage of persons engaged in the making of Machinery, for which purpose the above makes of Pig Iron are particularly adapted.

They are also sole Agents for Watson's celebrated Fire Bricks and prepared Kaolin or Fire Clay orders for which are promptly supplied.

**SAM'L KIMBER, & CO.,**  
59 North Wharves,  
Jan. 14, 1846. [1y4] Philadelphia, Pa.

**RAY'S EQUALIZING RAILWAY TRUCK.—THE SUBSCRIBER** having recently formed a business connection in the City of New

York, expressly for the manufacture of the newly patented and highly approved Railroad Truck of Mr. Fowler M. Ray, is ready to receive orders for building the same, from Railroad Companies and Car Builders in the United States, and elsewhere.

The above Truck has now been in use from one to two years on several roads a sufficient length of time to test its durability, and other good qualities, and to satisfy those who have used it, as may be seen by reference to the certificates which follow this notice.

There have been several improvements lately introduced upon the Truck, such as additional springs in the bolser of passenger cars, making them delightful riding cars—adapting it to tenders, trucks forward of the locomotive, and freight cars, which, with its original good qualities, make it in all respects the most desirable truck now offered to the public.

Orders for the above, will, for the present, be executed at the New York Screw Mill, corner 33d street and 3d avenue, (late P. Cooper's rolling mills) and at the Steam Engine Shop of T. F. Secor & Co., foot of 9th street, East

**RAILROAD IRON.—THE NEW JERSEY** Iron Company, Boonton, N. J., are now preparing to make Railroad Bars, and are ready to take orders or make contracts for Rails, deliverable after the first of December next. Apply to

**FULLER & BROWN, Agent,**  
No. 139 Greenwich, corner of Cedar street.  
September 18, 1846. 10c39

**LAWRENCE'S ROSENDALE HYDRAULIC** Cement. This cement is warranted equal to any manufactured in this country, and has been pronounced superior to Francis' "Roman." Its value for Aqueducts, Locks, Bridges, Flooms and all Masonry exposed to dampness, is well known, as it sets immediately under water, and increases in solidity for years.

For sale in lots to suit purchasers, in tight papered barrels, by **JOHN W. LAWRENCE,** 142 Front street, New York.

Orders for the above will be received and promptly attended to at this office. 32 17

**ENGLISH PATENT WIRE ROPES—FOR THE USE OF MINES, RAILWAYS, ETC.—** for sale or imported to order by the subscriber.

These Ropes are manufactured on an entirely different principle from any other, and are now almost exclusively used in the collieries and on the railways in Great Britain, where they are considered to be greatly superior to hempen ones, or iron chains, as regards safety, durability and economy. The plan upon which they are made effectually secures them from corrosion in the interior, as well as the exterior of the rope, and gives a greater compactness and elasticity than is found in any other manufacture.

Many of these ropes have been in constant operation in the different mines in England, and on the Blackwall and other inclined planes, for three and four years, and are still in good condition.

They have been applied to almost every purpose for which hempen ropes have been used—mines, heavy cranes, standing rigging, window cords, lightning conductors, signal halyards, tiller ropes, etc. Reference is made to the annexed statement for the relative strength and size. Testimonials from the most eminent engineers in England can be shown as to their efficiency, and any additional information required respecting the different descriptions and application will be given by

**ALFRED L. KEMP,**  
75 Broad street, New York, sole agent in the United States.  
Statement of Trial made at the Woolwich Royal Dock Yard, of the Patent Wire Ropes, as compared with Hempen Ropes and Iron Chains of the same strength.—October, 1841.

WIRE ROPES.				HEMPEN ROPES.				CHAINS.		STRENGTH
Wire gauge number.	Circumference of rope.	Weight per fathom.		Circumference of rope.	Weight per fathom.		Weight per fathom.	Diameter of iron.	Tons.

16	2½	4	3	6	8	8	10½	7-16	7	

N.B. The working load, with a perpendicular lift, may be taken at 6 cwt. for every lb. weight per fathom, so that a rope weighing 5 lbs. per fathom would safely lift 3360 lbs., and so on in proportion. 1y24

river, (of which firm the subscriber was late a partner) under the immediate supervision of Mr. Ray himself.

Several sets of trucks containing the latest improvements have recently been turned out for the New York and Erie railroad, and the New Jersey Transportation company, which may be seen upon said roads.

The patronage of Railroad Companies and Car Builders is respectfully solicited.

New York, May 4, 1846. **W. H. CALKINS, and Others.**  
To all whom it may concern:—This is to certify that the New Haven, Hartford and Springfield railroad co., have had in use six sets of F. M. Ray's patent trucks for the last 30 months, during which time it appears to me, they have proved to be the best and most economical truck now in use.

[Signed,] **WILLIAM ROE, Supt of Power.**  
I certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Philadelphia and Reading railroad for some time past, under a passenger car.

For simplicity of construction, economy in cost, lightness of material, and extreme ease of motion, I consider it the best truck we have ever used. Its peculiar make also renders it less liable to be thrown off the track, when passing over any obstruction. We intend using it extensively under the passenger and freight cars of the above road.

Reading, Pa., October 6, 1845. [Signed,] **G. A. NICOLL,** Supt. Transportation, etc., Philadelphia and Reading Railroad.

To all whom it may concern:—This is to certify that the N. Jersey Railroad and Transportation company have used Fowler M. Ray's Truck for the last seven months, during which time it has operated to our entire satisfaction. I have no hesitation in saying that it is the simplest and most economical truck now in use.

[Signed,] **T. L. SMITH,** Jersey City, November 4, 1845. N. Jersey Railroad and Transp. Co.

This is to certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Long Island railroad for the last year, under a freight car. For simplicity of construction, economy in cost, lightness of material and ease of motion, I consider it equal to any truck we have in use.

Long Island Railroad Depot, } [Signed,] **JOHN LEACH,** Jamaica November 12, 1845. } 1y19 Supt Motive Power.

**RICH & CO'S IMPROVED PATENT SALAMANDER SAFES.**

Warranted free from dampness, as well as fire and thief proof.

Particular attention is invited to the following certificates, which speak for themselves:

**TEST No. 10.**

*Certificate from Mr. Silas C. Field, of Vicksburg, Mississippi.*

On the morning of the 14th ult., the store owned and occupied by me in this city, was, with its contents, entirely consumed by fire. My stock of goods consisted of oil, rosin, lard, pork, sugar, molasses, liquors, and other articles of a combustible nature, in the midst of which was one of Rich's Improved Patent Salamander Safes, which I purchased last October of Mr. Isaac Bridge, New Orleans, and which contained my books and papers. This safe was red hot, and did not cool sufficiently to be opened until 16 hours after it was taken from the ruins. At the expiration of that time it was unlocked, and its contents proved to be entirely uninjured, and not even discolored. I deem this test sufficient to show that the high reputation enjoyed by Rich's Safes is well merited.

S. C. FIELD.

**TEST No. 11.—Certificate.**

By the fire which occurred in this village on the 27th July last, our Law Office, together with many other buildings, was destroyed—we had in our office one of Rich's Improved Patent Salamander Safes, which, though heated red hot, preserved, without being the least damaged, many papers valuable to our clients—the envelopes of a few papers being slightly scorched. Some twenty-four hours after the fire, the Safe was removed, and so hot was it, that several hours were required for it to cool off. Our office was in the second story of a large brick building, all the wood used in construction of said house being pitch pine. While the Safe was red hot, one of the walls tumbled in, and so injured the lock that it was necessary to break the door open. From this test, we feel no hesitancy in recommending "Rich's Patent Salamander Safe" as *entirely fire proof*.

GOREE & KING.

Marion, Ala., Sept. 15th, 1846.

*Still other Tests in the Great Fire of July 19, 1845.*

The undersigned purchased of A. S. Martin, No. 138½ Water street, one of Rich's Improved Patent Salamander Safes, which was in our store, No. 54 Exchange place. The store was entirely consumed in the great conflagration on the morning of the 19th inst. The safe was taken from the ruins 52 hours after, and on opening it, the books and papers were found entirely uninjured by fire, and only slightly wet—the leather on some of the books was parched by the extreme heat.

RICHARDS & CRONKHITE.

Benton, Miss., December 27, 1845.

One of Rich's Improved Salamander Safes, which I purchased on the 2d of June last of A. S. Marvin, 138½ Water street, agent for the manufacturer, was exposed to the most intense heat during the late dreadful conflagration. The store which I occupied, No. 46 Broad street, was entirely consumed; the safe fell from the 3d story, about 15 feet, into the cellar, and remained there 14 hours, and when found, I am told, and from its appearance afterwards, should judge that it had been heated to a red heat. On opening it, the books and papers were found not to have been touched by fire. I deem this ordeal sufficient to confirm fully the reputation that Rich's safe has already obtained for preserving its contents against all hazards.

(Signed.)

WM. BLOODGOOD.

New York, 31st July, 1845.

Reference made to upwards of nine hundred and fifty merchants, cashiers, brokers, and officers of courts and counties, who have Rich's Safe's in use.

The above safes are finished in the neatest manner, and can be made to order at short notice, of any size and pattern, and fitted to contain plate, jewelry, etc. Prices from \$50 to \$500 each. For sale by

A. S. MARVIN, General Agent,  
138½ Water st., N. Y.

Also by Isaac Bridge 76 Magazine street, New Orleans.

Also by Lewis M Hatch, 130 Meeting street  
Charleston, S. C.

**FRENCH AND BAIRD'S PATENT SPARK ARRESTER.**

**TO THOSE INTERESTED IN** Railroads, Railroad Directors and Managers are respectfully invited to examine an improved SPARK ARRESTER, recently patented by the undersigned.

Our improved Spark Arrester have been extensively used during the last year on both passenger and freight engines, and have been brought to such a state of perfection that no annoyance from sparks or dust from the chimney of engines on which they are used is experienced.

These Arresters are constructed on an entirely different principle from any heretofore offered to the public.

The form is such that a rotary motion is imparted to the heated air, smoke and sparks passing through the chimney; and by the centrifugal force thus acquired by the sparks and dust they are separated from the smoke and steam, and thrown into an outer chamber of the chimney through openings near its top, from whence they fall by their own gravity to the bottom of this chamber; the smoke and steam passing off at the top of the chimney, through a capacious and unobstructed passage, thus arresting the sparks without impairing the power of the engine by diminishing the draught or activity of the fire in the furnace.

These chimneys and arresters are simple, durable and neat in appearance. They are now in use on the following roads, to the managers and other officers of which we are at liberty to refer those who may desire to purchase or obtain further information in regard to their merits:

R. L. Stevens, President Camden and Amboy Railroad Company; Richard Peters, Superintendent Georgia Railroad, Augusta, Ga.; G. A. Nicolls, Superintendent Philadelphia, Reading and Pottsville Railroad, Reading, Pa.; W. E. Morris, President Philadelphia, Germantown and Norristown Railroad Company, Philadelphia; E. B. Dudley, President W. and R. Railroad Company, Wilmington, N. C.; Col. James Gadsden, President S. C. and C. Railroad Company, Charleston, S. C.; W. C. Walker, Agent Vicksburg and Jackson Railroad, Vicksburg, Miss.; R. S. Van Rensselaer, Engineer and Sup't Hartford and New Haven Railroad; W. R. M'Kee, Sup't Lexington and Ohio Railroad, Lexington, Ky.; T. L. Smith, Sup't New Jersey Railroad Trans. Co.; J. Elliott, Sup't Motive Power Philadelphia and Wilmington Railroad, Wilmington, Del.; J. O. Sterns, Sup't Elizabethtown and Somerville Railroad; R. R. Cuyler, President Central Railroad Company, Savannah, Ga.; J. D. Gray, Sup't Macon Railroad, Macon, Ga.; J. H. Cleveland, Sup't Southern Railroad, Monroe, Mich.; M. F. Chittenden, Sup't M. P. Central Railroad, Detroit, Mich.; G. B. Fisk, President Long Island Railroad, Brooklyn.

Orders for these Chimneys and Arresters, addressed to the subscribers, care Messrs. Baldwin & Whitney, of this city or to Hinckley & Drury, Boston, will be promptly executed.

FRENCH & BAIRD.

N. B.—The subscribers will dispose of single rights, or rights for one or more States, on reasonable terms.

Philadelphia, Pa., April 6, 1844.

\*. The letters in the figures refer to the article given in the Journal of June, 1844.

ja45

**PATENT HAMMERED RAILROAD, SHIP**

and Boat Spikes. The Albany Iron and Nail Works have always on hand, of their own manufacture, a large assortment of Railroad, Ship and Boat Spikes, from 9 to 12 inches in length, and of any form of head. From the excellence of the material always used in their manufacture, and their very general use for railroads and other purposes in this country, the manufacturers have no hesitation in warranting them fully equal to the best spikes in market, both as to quality and appearance. All orders addressed to the subscriber at the works, will be promptly executed.

JOHN F. WINSLOW, Agent.

Albany Iron and Nail Works, Troy, N. Y. The above spikes may be had at factory prices, of Erastus Corning & Co., Albany; Hart & Merritt, New York; J. H. Whitney, do.; E. J. Eting, Philadelphia; Wm. E. Coffin & Co., Boston.

ja45

**MACHINE WORKS OF ROGERS,**

Ketchum & Grosvenor, Patterson, N. J. The undersigned receive orders for the following articles, manufactured by them of the most superior description in every particular. Their works being extensive and the number of hands employed being large, they are enabled to execute both large and small orders with promptness and despatch.

Railroad Work.

Locomotive steam engines and tenders; Driving and other locomotive wheels, axles, springs & flange tires; car wheels of cast iron, from a variety of patterns, and chills; car wheels of cast iron with wrought tires; axles of best American refined iron; springs; boxes and bolts for cars.

Cotton, Wool and Flax Machinery of all descriptions and of the most improved patterns, style and workmanship.

Mill gearing and Millwright work generally; hydraulic and other presses; press screws; callenders; lathes and tools of all kinds; iron and brass castings of all descriptions.

ROGERS, KETCHUM & GROSVENOR,  
ja45 Patterson, N. J., or 60 Wall street, N. York.

**PATENT RAILROAD, SHIP AND BOAT**

Spikes. The Troy Iron and Nail Factory keeps constantly for sale a very extensive assortment of Wrought Spikes and Nails, from 3 to 10 inches, manufactured by the subscriber's Patent Machinery, which after five years' successful operation, and now almost universal use in the United States (as well as England, where the subscriber obtained a patent) are found superior to any ever offered in market.

Railroad companies may be supplied with Spikes having countersink heads suitable to holes in iron rails, to any amount and on short notice. Almost all the railroads now in progress in the United States are fastened with Spikes made at the above named factory—for which purpose they are found invaluable, as their adhesion is more than double any common spikes made by the hammer.

All orders directed to the Agent, Troy, N. York will be punctually attended to.

HENRY BURDEN, Agent.

Spikes are kept for sale, at Factory Prices, by J. & J. Townsend, Albany, and the principal Iron merchants in Albany and Troy; J. I. Brower, 222 Water St., New York; A. M. Jones, Philadelphia; T. Janviers, Baltimore; Degrand & Smith, Boston.

\*. Railroad Companies would do well to forward their orders as early as practicable, as the subscriber is desirous of extending the manufacturing so as to keep pace with the daily increasing demand.

ja45

**SPRING STEEL FOR LOCOMOTIVES,**

Tenders and Cars. The Subscriber is engaged in manufacturing Spring Steel from 1½ to 6 inches in width, and of any thickness required: large quantities are yearly furnished for railroad purposes, and wherever used, its quality has been approved of. The establishment being large, can execute orders with great promptitude, at reasonable prices, and the quality warranted. Address

JOAN F. WINSLOW, Agent,

Albany Iron and Nail Works,

# DAVENPORT & BRIDGES'

## CAR WORKS, CAMBRIDGEPORT, MASS.

Manufacture to Order, Passenger and Freight Cars of every description, and of the most improved pattern; also furnish Snow Ploughs and Chilled Wheels of any pattern and size. Forged Axles, Springs, Boxes and Bolts for Cars at the lowest prices.

All orders punctually executed and forwarded to any part of the country.

Our Works are within fifteen minutes ride from State street, Boston—Omnibuses pass every fifteen minutes. 10f

### THE HERRON RAILWAY TRACK,

As seen stripped of the top ballasting

A GOLD MEDAL AWARDED THE INVENTOR BY THE AMERICAN INSTITUTE.

**THE UNDERSIGNED RESPECTFULLY** invites the attention of Engineers, and Railroad Companies, to some highly important improvements he has recently made in the Herron system of Railway structure. These improvements enable him to effect a very large reduction in the quantity of Timber, and cost of construction, without impairing the strength of the Track, or its powers of resisting frost, while they secure additional features of excellence in the Drainage and facility of making Repairs.

The above cut represents the "Herron Track" as it is laid on the Philadelphia and Reading, and on the Baltimore and Susquehanna Railroads. The intersection of the sills of the trellis are 5 feet from centre to centre, while in the new construction they are only 2½ feet. This renders the string piece unnecessary, thus removing the only objectionable feature found in the Track.

The result of experience has proved that all Tracks constructed with longitudinal timbers, such as mud sills, and more especially, the continuous bearing string pieces retain the rain water that falls between the Rails, which, being thus confined, settles along those timbers, and accumulating in quantity flows rapidly along them on the descending grades, washing out the earth from under the timber, and frequently causing large breaches in the embankments of the road. Whereas all water intercepted by the oblique sills of the trellis, is discharged immediately into the side ditches.

In the 5 foot plan, the Track occupies a Road bed nearly 11 feet wide, while the new construction takes

but 8 feet; the timber being more concentrated under the Rails. A block of hard wood, about 2 feet long and 15 inches wide, is introduced into a square of the trellis for the purpose of giving an additional, and effectual support to the joints of the Rails, which rest upon it. Should these joint blocks become chafed and worn by the working, and imbedding of the chairs, as is now the case on all Railroads, they can be readily replaced without any derangement of the timbers less liable to wear.

The following is a general estimate of its cost near the seaboard. In the interior it will be considerably less.

#### ESTIMATE OF THE PROBABLE COST OF ONE MILE.

4,224 Timbers, 11 ft. long, 3 x 6 inches =	
68,696 ft. b.m., at \$10 =	\$686 96
587 Oak joint blocks 2 ft. x 3 x 15 in. =	
4,403 ft. b.m., at \$13 =	57 24
13,000 Spikes = 2,250 lbs. at 4½ cts. =	101 25
Workmanship free of patent charge =	600 00

Cost of one mile including the laying of the Rail = \$1,445 45

He has made other important improvements, which will be shown in properly proportioned models, that give a much better idea of the great strength of the Track than a drawing will do.

Sales of the Patent right to all the distant States will be made on liberal terms.

**JAMES HERRON.**

Civil Engineer and Patentee.

Leave Haverhill at 6 a.m. and 4 P. M.

## READING TRAINS.

Leave Boston at 9 A. M. and 8 P. M.  
Leave Reading at 6 A. M. and 1 p. M.

## MEDFORD BRANCH TRAINS.

Leave Boston at 7, 9 A. M., 2, 5-50 P. M.  
Leave Medford at 6, 8 A. M., 1, 5 p. M.

The Depot in Boston is on Haymarket Square.

Passengers are not allowed to carry baggage above \$50 in value, and that personal unless notice is given, and an extra amount paid, at the rate of the price of a Ticket for every \$500 additional value.

1731 CHAS. MINOT, Sup't.

## SUMMER ARRANGEMENT.—NEW YORK AND ERIE RAILROAD LINE, from April 1st until further notice, will

run daily (Sundays excepted) between the city of New York and Middletown, Goshen, and intermediate places, as follows:

### FOR PASSENGERS.—

Leave New York at 7 A. M. and 4 P. M.  
" Middletown at 6 A. M. and 3 P. M.

Fare reduced to \$1.25 to Middletown—way in proportion. Breakfast, supper and berths can be had on the steamboat.

### FOR FREIGHT.—

Leave New York at 5 P. M.  
" Middletown at 12 M.

The names of the consignees and of the station where to be left, must be distinctly marked upon each article shipped. Freight not received after 5 P. M. in New York.

Apply to J. F. Clarkson, agent, at office corner of Duane and West sts. H. C. SEYMOUR, Sup't. March 23th, 1846.

Stages run daily from Middletown, on the arrival of the afternoon train, to Milford, Carbondale, Honesdale, Montrose, Towanda, Owego, and West; also to Monticello, Windsor, Binghamton, Ithaca, etc., etc. Agent on board. 13 ly

## NORWICH AND WORCESTER RAILROAD.

Summer Arrangement, commencing Monday, April 6, 1846.

Accommodation Trains, daily, except Sunday. Leave Norwich, at 6 a.m., and 4 p.m. Leave Worcester, at 10 a.m., and 4 p.m.

The morning Accommodation Trains from Norwich, and from Worcester, connect with the trains of the Boston and Worcester and Western railroads each way.

The Evening Accommodation Train from Worcester connects with the 11 p.m. train from Boston.

New York Train via Long Island Railroad: Leave Allyn's Point for Boston, about 1 p.m., daily, except Sunday.

Leave Worcester for New York, about 10 a.m., stopping at Webster, Danielsonville, and Norwich.

New York Train via Steamboat—Leave Norwich for Boston, every morning, except Monday, on the arrival of the steamboat from New York, stopping at Norwich and Danielsonville.

Leave Worcester for New York, upon the arrival of the train from Boston, at about 4 p.m., daily, except Sunday, stopping at Webster, Danielsonville and Norwich.

Freight Trains daily each way, except Sunday. Special contracts will be made for cargoes, or large quantities of freight, on application to the superintendent.

Fares are less when paid for Tickets than when paid in the Cars.

31 ly J. W. STOWELL, Sup't.

## DAVENPORT & BRIDGES'

### CAR WORKS, CAMBRIDGEPORT, MASS.

Manufacture to Order, Passenger and Freight Cars of every description, and of the most improved pattern; also furnish Snow Ploughs and Chilled Wheels of any pattern and size. Forged Axles, Springs, Boxes and Bolts for Cars at the lowest prices.

All orders punctually executed and forwarded to any part of the country.

Our Works are within fifteen minutes ride from State street, Boston—Omnibuses pass every fifteen minutes.

## BRANCH RAILROAD AND STAGES CONNECTING WITH THE BOSTON AND PROVIDENCE RAILROAD.

Stages connect with the Accommodation trains at the Foxboro' Station, to and from Woonsocket. At the Seekonk Station, to and from Lonsdale, R. I. via Pawtucket. At the Sharon Station, to and from Walpole, Mass. And at Dedham Village Station, to and from Medford, via Medway, Mass. At Providence, to and from Bristol, via Warren, R. I.—Taunton, New Bedford and Fall River cars run in connection with the accommodation trains.

## PHILADELPHIA AND READING RAILROAD.—Passenger Train Arrangement for 1847.

A Passenger Train will leave Philadelphia and Pottsville daily, except Sundays, at 9 o'clock A. M.

The Train from Philadelphia arrives at Reading at 12 18 M.

The Train from Pottsville arrives at Reading at 10 43 A. M.

Fares.	Miles.	No. 1.	No. 2.
Between Phila. and Pottsville, 92		\$3.50 and \$3.00	
" " Reading, 58		2.25 and 1.90	
" " Pottsville, 34		1.40 and 1.20	

Five minutes allowed at Reading; and three at other way stations.

Passenger Depot in Philadelphia corner of Broad and Vine streets.

## LEXINGTON AND OHIO RAILROAD.

Trains leave Lexington for Frankfort daily, at 5 o'clock a.m., and 2 p.m.

Trains leave Frankfort for Lexington daily, at 8 o'clock a.m. and 2 p.m. Distance, 28 miles. Fare \$1.25.

On Sunday but one train, 5 o'clock a.m. from Lexington, and 9 o'clock p.m. from Frankfort.

The winter arrangement (after 15th September to 15th March) is 6 o'clock a.m. from Lexington, and ma. 9. from Frankfort, other hours as above.

## BOSTON AND MAINE RAILROAD.

Upper Route, to Portland and the East.

## SPRING ARRANGEMENT, March 1, 1847.

## PORTLAND TRAINS.

Leave Boston at 7½ A.M. and 2½ P.M.  
Leave Portland at 7½ A.M. and 3 P.M.

## GREAT FALLS TRAIN.

Leave Boston at 4½ P.M.  
Leave Great Falls at 6½ A.M.

## HAVERHILL TRAINS.

Leave Boston at 11½ A.M. and 5:50 P.M.  
Leave Haverhill at 6½ A.M. and 4 P.M.

## READING TRAINS.

Leave Boston at 9 A.M. and 8 P.M.  
Leave Reading at 6½ A.M. and 1½ P.M.

## MEDFORD BRANCH TRAINS.

Leave Boston at 7½, 9 A.M., 2½, 5:50 P.M.  
Leave Medford at 6½, 8 A.M., 1½, 5½ P.M.

The Depot in Boston is on Haymarket Square.

Passengers are not allowed to carry Baggage above \$50 in value, and that personal, unless notice is given, and an extra amount paid, at the rate of the price of a Ticket for every \$500 additional value.

CHAS. MINOT, Sup't.

## SUMMER ARRANGEMENT.—NEW YORK AND ERIE RAILROAD LINE, from April 1st until further notice, will run daily (Sundays excepted) between the city of New York and Middletown, Goshen, and intermediate places, as follows:

FOR PASSENGERS—  
Leave New York at 7 A. M. and 4 P. M.  
" Middletown at 6½ A. M. and 5½ P. M.

FARE REDUCED TO \$1.25 to Middletown—way in proportion. Breakfast, supper and berths can be had on the steamboat.

FOR FREIGHT—  
Leave New York at 5 P. M.  
" Middletown at 12 M.

The names of the consignee and of the station where to be left, must be distinctly marked upon each article shipped. Freight not received after 5 P. M. in New York.

Apply to J. F. Clarkson, agent, at office corner of Duane and West sts. H. C. SEYMOUR, Sup't. March 25th, 1846.

Stages run daily from Middletown, on the arrival of the afternoon train, to Millford, Carbondale, Honesdale, Montrose, Towanda, Owego, and West; also to Monticello, Windsor, Binghamton, Ithaca, etc., etc. Agent on board. 13th

## NORWICH AND WORCESTER RAILROAD.

Summer Arrangement, commencing Monday, April 6, 1846.

Accommodation Trains, daily, except Sunday. Leave Norwich, at 6 a.m., and 4½ p.m. Leave Worcester, at 10 a.m., and 4½ p.m.

The morning Accommodation Trains from Norwich, and from Worcester, connect with the trains of the Boston, and Worcester and Western railroads each way.

The Evening Accommodation Train from Worcester connects with the 1½ p.m. train from Boston.

New York Train via Long Island Railroad: Leave Allyn's Point for Boston, about 1 p.m., daily, except Sunday.

Leave Worcester for New York, about 10 a.m., stopping at Webster, Danielsonville, and Norwich.

New York Train via Steamboat—Leave Norwich for Boston, every morning, except Monday, on the arrival of the steamboat from New York, stopping at Norwich and Danielsonville.

Leave Worcester for New York, upon the arrival of the train from Boston, at about 4½ p.m., daily, except Sunday, stopping at Webster, Danielsonville and Norwich.

Freight Trains daily each way, except Sunday.—Special contracts will be made for cargoes, or large quantities of freight, on application to the superintendent.

Fares are Less when paid for Tickets than when paid in the Cars.

J. W. STOWELL, Sup't.

**TROY RAILROADS.**—IMPORTANT NOTICE.—Troy and Greenbush Railroad, forming a continuous track from Boston

 to Buffalo and Saratoga Springs.  This road is new, and laid with the heaviest iron rail. Trains will always be run on this road connecting at Greenbush each way with the trains to and from Boston and intermediate places, leaving Greenbush daily at 1 1/2 p.m. and 6 p.m., or on arrival of the trains from Boston; leave Troy at 7 1/2 a.m. and 4 1/2 p.m., or to connect with trains to Boston.

Trains also run hourly on this road between Troy and Albany. Running time between Greenbush and Troy, 15 minutes.

**TROY AND SCHENECTADY RAILROAD.** This road is laid its entire length with the heaviest H rail—which is not the fact with the road from Albany. Trains will always be run on this road connecting each way, to and from Buffalo and intermediate places. Leave Troy for Buffalo at 7 1/2 a.m. and 1 p.m. and 6 1/2 p.m., or to connect with the train for the west; leave Schenectady at 2 1/2 a.m., 8 1/2 a.m., 1 p.m. and 3 1/2 p.m., or on arrival of the trains from Buffalo and intermediate places.

**TROY AND SARATOGA RAILROAD.**  
THE ONLY DIRECT ROUTE.

No change of passenger, baggage or other cars on this route. Cars leave Troy for Baliston, Saratoga Springs, Lake George and White Hall at 7 1/2 a.m., (arriving one hour in advance of the train from Albany,) and at 3 1/2 p.m. Returning, leave Saratoga at 9 a.m. and 3 1/2 p.m., (reaching Troy in time for the evening boats to New York.) Cars also leave Troy for the Burrough at 3 1/2 p.m. and 7 p.m., connecting with packet boats for the north. This takes passengers from New York and Boston to Montreal in 44 hours.

N.B. Travellers will find the routes through Troy most convenient and economical, and as expeditious as any other. The steamboats to and from New York land within a few steps of the railroad office, and passengers are taken up and landed by the different railroad lines at the doors of principal hotels, thus saving all necessity for, and annoyance from, hack drivers, cabmen, runners, etc.

Aug 3, 1846.

1y 32

**BALTIMORE AND OHIO RAILROAD.** MAIN STEM. The Train carrying the Great Western Mail leaves Bal-

 timore every morning at 7 1/2 and  Cumberland at 8 o'clock, passing Ellicott's Mills, Frederick, Harpers Ferry, Martinsburgh and Hancock, connecting daily each way with the Washington Trains at the Relay House seven miles from Baltimore, with the Winchester Trains at Harpers Ferry—with the various railroad and steamboat lines between Baltimore and Philadelphia and with the lines of Post Coaches between Cumberland and Wheeling and the fine Steamboats on the Monongahela Slack Water between Brownsville and Pittsburgh. Time of arrival at both Cumberland and Baltimore 5 1/2 P. M. Fare between those points \$7, and 4 cents per mile for less distances. Fare through to Wheeling \$11 and time about 36 hours, to Pittsburgh \$10, and time about 32 hours. Through tickets from Philadelphia to Wheeling \$13, to Pittsburgh \$13. Extra train daily except Sundays from Baltimore to Frederick at 4 P. M., and from Frederick to Baltimore at 8 A. M.

**WASHINGTON BRANCH.**

Daily trains at 9 A. M. and 5 P. M. and 12 at night from Baltimore and at 6 A. M. and 5 1/2 P. M. from Washington, connecting daily with the lines North, South and West, at Baltimore, Washington and the Relay house. Fare \$1 60 through between Baltimore and Washington, in either direction, 4 cents per mile for intermediate distances. 13y1

**MANUFACTURE OF PATENT WIRE.** Rope and Cables for Inclined Planes, Standing Ship Rigging, Mines, Cranes, Tillers etc., by JOHN A. ROEBLING, Civil Engineer, Pittsburgh, Pa.

These Ropes are in successful operation on the planes of the Portage Railroad in Pennsylvania, on the Public Ships, on Ferries and in Mines. The first rope put upon Plane No. 3, Portage Railroad, has now run 4 seasons, and is still in good condition. 2v19 1y

**NEW RAILROAD ROUTE FROM BUFFALO TO CINCINNATI.**

Passengers destined for  Columbus and Cincinnati,  Louisville, Ky., St. Louis, Mo., Memphis, Tenn., Vicksburg, Natches, New Orleans, and all intermediate ports, will find a new, and the most expeditious and comfortable Route, by taking Steamboats at Buffalo, landing at Sandusky City, Ohio, distance..... 230 miles.

From thence by Cars, over the Mansfield Railroad which is new and just opened (laid with heavy iron,) to Mansfield, distance..... 56 " Thence by Stage via Columbus to Xenia over gravel and Macadamized Road, (the best in the state,) in new coaches, distance..... 88 " Thence, over the Little Miami Railroad, from Xenia to Cincinnati, distance.... 65 "

**TIME.**  
From Buffalo to Sandusky..... 24 hours.  
Leave Sandusky 5 a.m. to Columbus..... 14 "  
From Columbus to Cincinnati..... 15 "  
Or say 30 hours from Sandusky to Cincinnati over this route, including delays.

**FARE.**  
From Buffalo to Sandusky, Cabin.....\$6 00  
" " " " Steerage..... 3 00  
" Sandusky to Columbus..... 4 50  
" through to Cincinnati..... 8 00

Passengers should not omit to pay their fare through from Sandusky City to Cincinnati and take receipts availing themselves of the benefit of a contract existing between the said Railroad and Stage Co's, securing 121 miles travel by good Railroad and 88 miles by Stage, in crossing from Lake Erie to the Ohio river, in the space of 30 hours.

Passengers destined for St. Louis, or any point below on the Mississippi, will save by taking this route, from 4 to 6 days time and travel, and nearly half the expense, over the Chicago and Peoria route to the above places.

Fare by this route, although the cheapest, will in a short time be reduced, Railroad lengthened, and speed increased.

Manufactured and for sale by

MORRIS, TASKER & MORRIS.

Warehouse S. E. corner 3d and Walnut Sts., Philadelphia.

**T**O LOCOMOTIVE AND MARINE ENGINE BOILER BUILDERS. Pascal Iron Works, Philadelphia. Welded Wrought Iron Flues, suitable for Locomotives, Marine and other Steam Engine Boilers, from 2 to 6 inches in diameter. Also, Pipes for Gas, Steam and other purposes; extra strong Tube for Hydraulic Presses; Hollow Pistons for Pumps of Steam Engines, etc. Manufacture and for sale by

MORRIS TASKER & MORRIS.

Warehouse S. E. corner 3d and Walnut Sts., Philadelphia.

**P**ATENT INDESTRUCTIBLE WATER

Pipes. The subscribers continue to manufacture the above Pipes, of all the sizes and strength required for City or Country use, and would invite individuals or companies to examine its merits. This pipe, unlike cast iron and lead, imparts neither color, oxide or taste, being formed of strongly riveted sheet iron, and evenly lined on the inside with hydraulic cement. While in the process of laying, it has a thick covering externally of the same—thus forming nature's own conduit of stone. The iron being thoroughly enclosed on both sides with cement, precludes the possibility of rust or decay, and renders the pipe truly indestructible. The prices are less than those of iron or lead. We also manufacture Basins and D. Traps, for Water Closets, on a new principle, which we wish the public to examine at 113 Fulton street, New York.

J. BALL & CO.

**New York and Erie Railroad.**  
*Report of the Commissioners.*

We have received a copy of the report, made by a majority of the commissioners, appointed by the New York Legislature, to decide upon the final location of this important work, between the Shawangunk mountain and Binghamton, which we shall give nearly entire, with the profile showing both routes. It is hardly necessary for us to call attention to it, as its importance will necessarily secure for it a careful perusal; we will however say, that every man interested in railroads will find his advantage in reading it more than once.

The report is of course made to the Legislature, and is as follows, viz:

The Commissioners appointed by "An Act to amend an Act entitled, 'An Act in relation to the construction of the New York and Erie Railroad,' passed May 11th, 1846, and for other purposes," respectfully present the following REPORT:

The fifth and sixth sections of the Act direct that the Commissioners shall proceed to adjudge and determine, whether in their opinion, a practicable interior line or route exists, upon which the company can construct their railroad, without great prejudice to the public interest of the State, and the interest of the citizens collectively considered, who will be affected by the construction and location of the road.

The seventh section of the Act directs that, in determining the question whether such routes exist, the Commissioners shall take several matters into consideration, among which is a comparison of grades, elevations and depressions, and curvatures, on the line or track of such railroad, in other counties east and west of Sullivan county.

It was urged on the part of the friends of the interior route that under the Act, the Commissioners had only to determine, as an abstract and independent fact, whether a practicable interior line or route existed upon which a road could be constructed without great prejudice to the public interest, and that in coming to such determination, the Commissioners were not authorized to compare it with any other line or route, or to survey any other route with a view to such comparison.

If such a narrow construction of the Act were to prevail, it is very apparent that the Commissioners would have nothing to do but to establish the interior routes, as it is quite evident such routes are practicable; that it is possible to construct a railroad thereon, and that such railroad, instituting no comparison with any other line, can be constructed without great prejudice to the public interest. But these facts were as clear to the Legislature, who enacted the law, as they are to the Commissioners, who act under it. They were perfectly obvious from the surveys, reports and estimates before the Legislature; and if the Legislature entertained the views presupposed by such construction, they would have simply directed the construction of the road, without any useless reference to Commissioners.

It seemed to the Commissioners further quite evident, that whether the interior lines were practicable, and afforded routes for the

construction of a railroad, without great prejudice to the public interest, was not a question of mere abstract practicability and freedom from injury, but was necessarily comparative. The Commissioners could not adjudicate as to the matters which they were required by the act to adjudicate, without comparing the interior routes with some other routes, and from the comparison make the determination. The Act, in the estimation of the Commissioners, clearly contemplated such comparison, as a preliminary to the adjudication; and it was to them as clear, that the comparison should be made between the interior routes, and the routes through Pennsylvania. The application of the company for leave to construct a portion of their road in Pennsylvania, which was followed by the law under which the Commissioners acted, and from the provisions of said law, clearly indicated the propriety of making such a comparison of routes.

It is believed that the Commissioners were unanimous in the opinion, that as an abstract question, practicable interior lines did exist upon which a railroad could be constructed; and also, in the opinion that it was proper in making an adjudication to compare the interior lines or routes with the Pennsylvania routes, both of which had been caused by the Commissioners to be surveyed and estimates of cost made. It was found as the result of such surveys and estimates, that the grades of the interior routes were as favorable as they were supposed to be when the Act was passed, and that the expense of construction of the Pennsylvania route would be about a half a million of dollars more than upon the interior routes.

It is believed the Commissioners were unanimously of the opinion that the Pennsylvania routes, though constructed at a greater cost, and paying \$10,000 annually as a tax to the State of Pennsylvania, considered solely in view of the natural advantages of the two routes, would yet, from the much more favorable character of the grades, be the preferable route for the Company to adopt, and for the public to employ.

The evident purpose of appointing the Commissioners was, that they should obtain the facts accurately, compare the merits of the two routes candidly, and to determine upon the interior routes, unless the merits of the Pennsylvania routes greatly preponderated. If the surveys of the interior routes, should prove to be more favorable than the surveys of the same routes previously before the Legislature, it does not therefore follow necessarily, that the interior routes should now be adopted. If that had been intended as a necessary consequence of such favorable results of the surveys, the Legislature would have so said. If the grades in the counties east and west of Sullivan, are steeper than the grades on the interior routes through Sullivan, it does not therefore necessarily follow, that such interior route should be adopted. The Legislature have not so directed. The more favorable grades shown by the recent surveys, are facts to be taken into consideration by the Commissioners, and to have

their due influence; but they are not to outweigh all the other facts of the case.

The important question is, can the road be constructed on the interior routes "without great prejudice to the public interest," and what, within the meaning of this act, is to be deemed such great prejudice, as when compared with the advantages of a more favorable location, to forbid the construction on the interior routes. The interests of the citizens who are to be affected by the location of the railroad, collectively considered, are to be taken into the account in making up the estimate of prejudice to such interests.

The interests of all the citizens living upon the line of the road, or within the vicinity of the line of the road, or whose property will be transported to market by means of the road, or who will be interested in the traffic of the road, will be affected by its location and construction.

Having submitted the preceding remarks, on the duties devolved by the Act, the Commissioners proceed to give a statement of their investigations and conclusions under it.

At a meeting of the Commissioners held on the 26th of May, two Engineers were appointed; one to make the surveys and estimates required on the routes between the summit of the Shawangunk ridge and Deposit; and the other for the routes between Deposit and a point one mile westerly of the village of Binghamton. Henry Tracy, Esq., was appointed to the first-mentioned routes, and James O. Morse, Esq., to the last-mentioned routes. Those engineers were both on the surveys under the previous commission; and they were directed to enlarge their parties for more full examination.

Under the views taken by the Commissioners, the Engineers were instructed to survey the routes that pass through portions of the State of Pennsylvania, on the Susquehanna and Delaware river. On the 23d of June the Commissioners held a meeting in New York, with the view of making a tour over the districts interested in the questions submitted to them, of obtaining a general knowledge of the country, of conferring with such of the inhabitants as desired to make suggestions, and also of advising with the Engineers as to the progress they had made, and the probable time when they would be able to submit the results of their surveys.

The Commissioners proceeded to Binghamton, and four of their number, Messrs. Childs, Wilson, Pierson and Dewey, returned by way of Nineveh to Deposit; thence, via the Delaware river to Port Jervis, and arrived at New York on the 3d of July; a meeting was there held by the Commissioners on that day; at which it was decided that a meeting be held at the same place on the 3d of August; whence they would proceed to Monticello, to Harpersville and Binghamton to hold sessions at these places respectively, on the 5th, 10th and 12th of August, in order to hear such parties as might have any matter to submit to their consideration, in relation to their duties under the Act. It was further decided that public notice of the proposed meetings, should be made in one of

the newspapers in the city of New York, one in each of the counties of Sullivan and Broome, and in the Albany Argus.

On the 3d of August, the Commissioners met in New York, and thence proceeded to the places indicated, and held meetings agreeably to the above-mentioned arrangement.

At each place the general result of the surveys made by the engineers was made public, and all persons who were disposed, had full opportunity to present their views, on the subjects submitted to the Commissioners. The several occasions were improved by friends of the different routes, who entered, in their discussions, fully into the reasonings which they respectively regarded as favorable to the routes they advocated.

**General Description of the Routes Surveyed under the Direction of the Commissioners.**—Commencing at a point about one mile westerly of the village of Binghamton, and extending easterly to Deposit; there are two routes; which for distinction are called, one the Nineveh or interior route; and the other the Susquehanna or river route.

The Nineveh route, passes up the Chenango Valley to Port Crane, near the mouth of Page Brook, where the heavy grade commences, thence follows Page Brook valley and reaches the summit between the Chenango and Susquehanna rivers, called the new Ohio summit. To reach this summit a grade of 65 feet to the mile is encountered. The line then descends and reaches the Valley of the Susquehanna at Nineveh. The line then ascends by a maximum grade of 65 feet per mile to the Bettsburgh summit, which is the summit between the Susquehanna and Nineveh and the Delaware at Deposit. The line then descends to Deposit. The total length is 43.58 miles.

The Susquehanna route passes through the village of Binghamton, and continues up the valley of the Susquehanna to near Lanesboro' in the State of Pennsylvania. To this point the maximum grade is 20 feet to the mile. It then leaves the valley of the Susquehanna and reaches the Gulf summit, or the summit between the Susquehanna at Lanesboro', and the Delaware at Deposit. The maximum grade to reach this summit, is 68 feet per mile. The line then descends to Deposit: the total length is 39.29 miles.

The following tabular statement show the essential character of the two routes:

	Susquehanna, or River Route.	Nineveh, or Interior Route.
Maximum grade going east.....	68 ft. per mile.	65 ft. per mile
Do. do. do. west.....	67 " "	74 " "
No. of summits.....	1 summit.	2 summits.
Length of line on which maximum grade rules.....	15.66 miles.	35.6 miles.
Total ascent going east.....	540 feet.	1087 feet.
Do. do. do. west.....	395 "	936 "
Total rise and fall.....	935 "	2023 "
Minimum radius of curves.....	1000 "	1056 "
Total curvature, in degrees.....	2371 degrees.	3253 degrees.
Length of lines.....	39.29 miles.	43.58 miles.
Total estimated cost of grading, with superstructure on extra length.....	\$746,900.	\$628,600.

The maximum grades for loads moving eastward are three feet per mile greater on the Susquehanna route, than on the Nineveh route. The length of line on which maximum grade rules is nearly 20 miles less on the Susquehanna than on the Nineveh route. The total ascent for both east and west is 1088 feet greatest on the Nineveh route. The radius of minimum curvature, is the most favorable by 56 feet in 1000, for the Nineveh route. The total curvature is 882 degrees, or 245 circles most favorable for the Susquehanna route. From Deposit, the line proceeds down the valley of the Delaware river about 40 miles, to the mouth of Callicoon creek. To this point it is common to the two routes between the mouth of the Callicoon creek and the summit of the Shawangunk ridge in Orange county.

The two routes between the points last mentioned, for the purpose of distinction, we call, one the Sullivan county, or interior route, and the other the Delaware river or southern route.

The Sullivan County or interior route follows up the valley of the Callicoon creek, thence crossing to the Mongaup and Neversink rivers, and over the dividing ridge, between the latter and the head waters of the Sandberg creek, which it follows several miles, and thence by the Mamakating valley to the village of Wurtsboro'. The distance from the mouth of the Callicoon to Wurtsboro' is 52.58 miles. There are several different rates of ascending grade going eastward, the maximum of which 45 feet per mile. From Wurtsboro', the line begins to ascend the northwestern slope of the Shawangunk mountain, and reaches the point of junction at the summit gap in a distance of 8.56 miles, with a maximum grade of 45 feet per mile.

The Delaware river route continues down the valley of the Delaware river, from the point of divergence at the mouth of Callicoon creek. It occupies the New York side of the Delaware river, for 20.23 miles, and then crosses it to the Pennsylvania side, and follows that side about 27 miles; where it recrosses, and thence continues on the New York side to Port Jervis. The distance from the mouth of the Callicoon creek to this place is 48.97 miles; the line then leaves the valley of the Delaware, crosses the table land and the valley of the Neversink and ascends the northwestern slope of the Shawangunk mountain, reaching the summit gap in a distance of 9.56 miles. The grade going east from the Callicoon to Port Jervis, is either level or descending; and from Port Jervis to the summit of the Shawangunk, the maximum grade is 50 feet per mile.

The maximum grade of 45 feet per mile, rules for 61.14 miles on the interior route; and at 50 feet per mile for 9.56 miles on the river route. The total rise and fall is 1466 feet more on the interior than on the river route: the minimum radius of curvature 245 feet less favorable; and the total curvature is 2021 degrees, (equal to 839 circles,) less favorable on the interior than on the river route.

The following tabular statement shows the essential character of the two routes:

	Delaware River Route.	Sullivan County or Interior Route.
Maximum grade ascending east.....	50 ft. per mile.	45 ft. per mile.
Do. do. do. west.....	15 " "	47 " "
No. of summits.....	1	5
Total ascent east.....	1454 feet.	1187 feet.
" " west.....	316 "	1049 "
" ascent and descent.....	770 "	2236 "
Total length of line on which maxim. grade rules.....	9.56 miles.	61.14 miles.
Minimum radius of curves.....	1200 feet.	955 feet.
Total curvature.....	4588 degrees.	7609 degrees.
Length of lines.....	58.53 miles.	61.14 miles.
Estimated cost of grading.....	\$1,496,430	\$1,094,950.
Length from the mouth of the Callicoon.....	48.97 miles to Port Jervis.	52.58 miles to Wurtsboro'.

In considering the question of motive power on the routes in question, it becomes necessary to understand the influence of the adjacent parts of the road.

Commencing at the point near Binghamton, the road westward of that place, for more than 100 miles, has no grade descending eastward, of more than 20 feet per mile. Consequently the trains will come to this point from the west, with loads adapted to a ruling grade of 20 feet per mile. With this load they would continue on the Nineveh route about 8 miles, to near Port Crane, and on the Susquehanna route, 23.6 miles, to near Lanesboro', in Pennsylvania.

The extra power will therefore be, the amount required above that necessary for a grade of 20 feet per mile. The two routes unite again at Deposit on the Delaware. The line then runs down the valley of the Delaware, as before observed, 40 miles, to the mouth of Callicoon creek, and is level, or slightly descending eastward.

Between the Shawangunk summit and the Hudson river, at Piermont, grades of 60 feet occur.

If the Nineveh and Sullivan county lines were adopted, it would be a question of some practical importance to decide whether it would not be best to make up the trains moving east, (the direction of greatest load,) to go through to the Hudson without extra power. This course would render the level grade, of 40 miles on the Delaware, of little importance: but the inconvenience of changing the arrangement of trains for this distance would probably counterbalance the advantage of doing so. If the system of extra power at the heavy grades be adopted, for these routes, then, extra power must be provided to take a train due to a 20 feet grade, at Port Crane, (near the mouth of Page Brook,) and carry it over grades of 65 feet per mile, for a distance of 35.6 miles to Deposit. At this place a train due to a road nearly level, will proceed to the Callicoon: where extra power

\* This applies only to the line from Port Jervis, 9.56 miles to the Shawangunk summit, and the Engineer, Mr. Tracy, states this may be reduced to 45 feet per mile.

† The Engineer, Mr. Tracy, says this may be reduced to 48 feet per mile.

must be provided to carry it (over grades of 45 feet) to the Shawangunk summit—the entire length of this route. The same, or nearly the same power would be required to proceed to Goshen, and increased so as to adapt it to a 60 feet grade, before the train leaves Orange county. Frequent changes of trains, or motive power, will be attended with inconvenience and extra expense, and in practice the trains and power will be regulated to avoid changes as much as possible, especially if the road has only a single track.

It will be a near approximation, and simplify the comparison, to consider the routes for computation of motive power, to terminate for the Sullivan county, at Wurtsboro'; and for the Delaware river, at Port Jarvis. Considering the ascent from both these places to the Shawangunk summit as nearly the same, one 45, and the other 50 feet per mile, (and as suggested by the Engineer, the latter could be reduced to 45 feet,) the trains may be made up at these places respectively, to proceed over the ruling grades to the Hudson river, which are higher than either of the above. The train is then made up at Deposit for a level road and for the interior line, extra power is provided to carry it over the heavy grades between the mouth of the Callicoon and Wurtsboro', or for a distance of 49 miles; leaving the extra length of the line to Wurtsboro', over that to Port Jarvis, for a separate estimate.

This arrangement, for a basis of comparative computation, will be as favorable for the interior lines as can be adopted; and it is proper to remark that, in any practical arrangement of business, the Commissioners are of the opinion it would be found most simple, efficient, and not less economical, to make up the train at Port Crane, in Broome county, to proceed to Deposit, and there adapt it to a ruling grade of 45 feet per mile, to be thence carried to the Shawangunk summit, and probably to Goshen. This mode of computation, however, would present a less favorable result, as no benefit would appear for the 40 miles of level grade on the Delaware, above the Callicoon creek.

It is important to this investigation to know the power and the cost of working locomotive engines.

The Commissioners have devoted their attention to this subject; and though it is one on which there is some conflict of opinion, the results arrived at in the following statement, are believed to be sustained by the most extensive experience, where detailed accounts have been kept.

*Cost of motive power on railroads per train per mile.*

1st. Enginemen, firemen and stationmen:

Baltimore and Ohio road,	5	cents.
Utica and Schenectady,	8	"
Reading,	4.55	
Boston and Worcester,	5.50	
Fitchburg,	7.00	
	30.05+5=	6.01

New York and Erie 7.485

2d. Fuel:

Reading, wood,	\$3 50,	23 70
Bost. & W., do.	4 90,	22 20

Fitchburg, do.	4 25,	14 17
*Balt. & O., coal,	2 00,	8 00
		68 07+4=172
New York and Erie,	18 09	
3d. Repairs of engines and tenders:		
Reading railroad,	4 90	
Boston and Worcester,	9 05	
Utica and Schenectady,	7 93	
Fitchburg,	5 20	
Western, (Mass.)	6 50	
*Baltimore and Ohio,	9 00	
		42 58+6=700

New York and Erie,	8 75		
4th. Oil and cotton waste:			
Reading railroad,	1 74		
Boston and Worcester,	1 24		
Fitchburg,	1 30		
Baltimore and Ohio,	1 46		
		5 74+4=	1 43

New York and Erie,	2 94		
5th. Interest on cost of engines:			
Baltimore and Ohio		3 01	
6th. Conductors and brakemen:			
Reading road,	4 11		
Fitchburg,	6 20		

	10 31+2=	5 15	
Take 63 per ct. for brakemen, which is the ratio on the Reading road, as conductors should not be included, and the expense for brakemen is . . . . .	5 15×63=	3 14	
Do. Baltimore and Ohio railroad, as per estimate for coal trade,		2 40	
		5 54+2=	2 70

New York and Erie,	6 52		
7th. Repairs of road, chargeable to locomotive and tender:			
I. Ordinary repairs: of these one-fifth is regarded as chargeable to motive power.			
Reading railroad,	13 66		
Boston and Worcester,	18 00		
Boston and Lowell,	13 50		
Western, Mass.,	13 75		
Baltimore and Ohio,	18 30		
		77 21+5=	15 44

and 15 44+5 = 2 09

II. Deterioration of iron, not yet settled by experience. Half of this wear is believed to be chargeable to locomotives and tenders, on account of their greater weight. Suppose rail cost \$7,000 per mile, and will bear transport of 20,000,000 tons on a level road, average say 250 tons freight per train, equal to 800,000 trains. The cost per train will be \$8 75; and half of this is 4 37—7 46

The weight of engines in the cases above detailed is not known, but is supposed to average less than 15 tons on their driving wheels; to provide cost for an engine of 20 tons on driving wheels, would require an additional expense; but the fuel on the line of road under consideration, would be less expensive by about seven cents, than the average for the same size of engine. In view of both considerations, it is believed, a reduction should be made from the preceding result of, say, 4 79

And the estimate for a 20 ton engine, \$40 00

Forty cents per mile run, for motive power with an engine of 20 tons on the driving wheels, appears to be about the cost as indicated by the experience of the roads above quoted from.

It is difficult to obtain the items of expense as very few railroad reports present the items separately; and where they are given, they frequently include expenses for both freight and passengers. The weight of trains has an influence on the cost per mile, and in providing for power, reference should be had to this circumstance. The range for a cord of wood is from 15 miles to 40 miles run, according to the weight of train and size of engine.

From the data above presented, with due consideration of the circumstances, we have come to the conclusion, that 40 cents per mile run with a 20 ton engine, is about the actual cost of motive power, including interest and renewal of engines and tenders, and their proportion (according to the influence of their action on the road) for repairs and maintenance of way.

*Calculation of Motive Power Required on Railroads.*—Some difference of opinion exists as to the proper data for this calculation. It is generally considered, that an engine in good order will work up to the adhesion of its driving wheels. The main question therefore is, as to the ratio of this adhesion. In the most favorable state of the rails, this ratio may be taken at one-sixth the weight; but in many instances, slightly unfavorable circumstances in the rails and the condition of the engine, will occur in the ordinary business of the road; and for general purposes a ratio of one-eighth of the insistent weight is regarded as most favorable data for calculating motive power.

The friction of the cars is another element, and will depend on their condition. For general use 8 1 2 pounds per gross ton of car and load, is considered a proper basis.

The ratio of the weight of freight to the gross weight of car and freight, must be considered. Two-thirds is a common rule for a trade that admits of regularity, as coal, etc. For a general business, it is believed the freight will be about six-tenths of the gross load of cars and freight.

An engine of 20 tons gross weight, all resting on the driving wheels, is assumed as the basis of the estimate—tender 10 tons.—The elements will therefore be:

Engine=20 tons=44,800 pounds on all the drivers.

Adhesion=one-eighth the insistent weight.

Friction=8 1 2 pounds per ton; this is, essentially, equal to the resistance of gravitation, on a rise of 20 feet to the mile. Of course for every 20 feet rise per mile, there must be added the power required to move the train on a level.

Ratio of freight to gross load, as 6 is to 10.

\* Estimate for coal trade in 1844.

44,800+8=5600 lbs=tractile power of engine, 5600+8 $\frac{1}{2}$ =658 tons, gross load, exclusive of engine.

The freight the engine will carry on different plains will be as follows:

	Gross tons.
On a level, 658—10 (the tender) $\times 6=380$	
Ascent per mile.	
20 feet, [(658—20)+2—10] $\times 6=185.4$	
30 feet, [(658—30)+2 $\frac{1}{2}$ —10] $\times 6=144.7$	
45 feet, [(658—45)+3 $\frac{1}{2}$ —10] $\times 6=107.16$	
48 feet, [(658—48)+3.4—10] $\times 6=101.64$	
50 feet, [(658—50)+3.5—10] $\times 6=98.22$	
60 feet, [(658—60)+4—10] $\times 6=83.7$	
65 feet, [(658—65)+4.25—10] $\times 6=77.7$	
68 feet, [(658—68)+4.4—10] $\times 6=74.42$	
74 feet, [(658—74)+4.7—10] $\times 6=68.55$	

The following table shows the ratio of freight carried by the same engine on different gradients; and also the multiplier, or number of engines, required on different inclinations to carry the same load—the unit being a level.

Level,	Grade of Road.	Ratio.	Multiplier.
Ascending 20 feet per mile,		1.000	
" 30 "	" "	.476	2.098
" 45 "	" "	.372	2.689
" 50 "	" "	.286	3.630
" 60 "	" "	.252	3.960
" 65 "	" "	.215	4.647
" 68 "	" "	.1999	5.006
" 74 "	" "	.1913	5.227

It is necessary to consider the ratio of freight moving in different or opposite directions. No certainty can be arrived at as to this ratio. It will no doubt vary at different times. Probably an average of three tons will move east, to the one west, and there can be no doubt, that the freight moving east will control the question of power, except on that portion which is in the valley of the Delaware river, where the return load of one-third the freight with the whole number of cars, will require greater power than the full load moving east.

The grade going eastward on the Delaware river has a maximum descent of 15 feet per mile, and assuming the ratio of freight to be 3 to 1, the result as to the greatest load that can be carried on it, will be as follows.

The engine assumed has been shown to be capable of carrying on a level a gross load of 648 tons, exclusive of engine and tender; or, 399 tons of freight. The gross load the engine will carry up an ascent of 15 feet per mile, exclusive of engine and tender, is 357 tons. If the freight be 358 tons, the gross load of cars and freight will be 596 tons. The cars for this load will be 238 tons. To return with one-third the freight and all the cars, the load will be 358+3+238=357 tons. It has been shown that 327 tons is the capacity of the engine on this ascent; consequently the load moving east can only be 358 tons of freight. The load moving east is therefore restricted by the load moving west.

The gross load due on an ascending grade of 20 feet is 300 tons, the freight 185.4 tons. The weight of cars required for this load is 124 tons; one-third the freight is 62 tons, together 186 tons. To return up a 74 feet grade will require 63 per cent. additional

power. It therefore appears, that the train engine with a load due to a grade of 20 feet per mile, (this would be the train from Hornellsville to Port Crane) moving east, would require extra power to return on the interior route from Deposit to Port Crane, equal to 65 per cent.

The investigation as applied to the line between Deposit and Wurtsboro, shows the following result: Down the Delaware, it has been shown, the load is 358 tons of freight. That portion of the interior line embraced in this section has a return grade of, say, 48 ft. per mile. [In the table it is given at 57 feet, but as there noted, the engineer states it may be reduced to 48 feet.] To return with cars and one-third freight, over the interior portion of the section, gives a gross load of cars and freight of 358+3+238=357 tons. The engine will carry 169.4 tons up this ascent, consequently 2-10 engines, or 1-10 extra engines will be required to carry the return load.

From Wurtsboro to the Shawangunk summit, the line has a ruling grade of 45 feet to the mile. From Port Jervis to the same point, the ruling grade is given in the table at 50 feet, but the engineer states this may be reduced to 45 feet, in which case they may be regarded as the same. It will not be very material whether the latter is 45 or 50 feet, as the trains would in practice, most probably be made up at either point so as to encounter the heavier grades that occur towards the eastern termination of the road. This being about 70 miles, it is not probable there would be a second change of train for this distance. There will therefore be no material difference whether the computation for the purpose of comparison be made to the Shawangunk summit, or stop on one line at Wurtsboro, and on the other at Port Jervis.

For the computation of extra power, it is proposed to take the Hornellsville train, which will be loaded for a 20 feet grade, and by extra power carry it over the heavy grades to Deposit. At this place make up a train that will be suitable for the Delaware river section, and provide extra power sufficient to carry it over the heavy grades between the mouth of Callicoon creek and Wurtsboro; leaving the trains to be there made up either at Wurtsboro or Port Jervis for the heavy grades between those places and Piermont. This method will require but two changes of trains between Binghamton and Piermont, and in view of the whole subject is regarded as presenting a fair basis for comparing the two lines. It gives the interior route the full benefit of the favorable grade on the Delaware, between deposit and the mouth of the Callicoon, which may not be, and probably will not be wholly available in practice; and the river route has some additional elevation between Port Jervis and the Shawangunk summit, which may be regarded as a partial offset.

It has been shown that extra power will be required mainly as aid to the train moving eastward; and that a portion of this power will be required for the return train. A part of the extra power required to move the train eastward might be dispensed with, when it

reached the last summit of the ruling grade. There will, however, be practical difficulties in this. It will cause too much change in arranging the power, and tend to confusion in conducting the business of the road; and it will deprive the heavy trains of the power that is sometimes quite necessary, and generally a convenience, in regulating their descent on the heavy grades. There are times when the state of the rails is such that it is impossible to control the trains on a heavy descending grade, by means of the friction brake alone, where the power of the engine is indispensable; and even that is not always sufficient. In view of all the circumstances, there can be no doubt the most judicious business arrangement would be to run the extra power over the whole section affected by the ruling grade, both ascending and descending in the direction of the greatest trade. As the extra power must run in both directions over the section requiring its aid, it will always be competent to carry the return load; and as the load eastward will determine the amount of extra power necessary to be provided, the computation will be simplified by considering it charged wholly to the freight moving in this direction. The engines must return; and though partially loaded with the train moving westward, the expense or comparison will not be affected, whether it be charged in this manner, or divided between the freight in both directions. The total cost of extra power will be therefore charged on freight moving eastward.

It has been shown that the cost of running an engine weighing 20 tons, and capable of carrying a train of 388 tons freight on a level, will be 40 cents per mile run. It is, however, well known, that extra power kept in readiness for running at intervals, and for short distances, cannot be maintained at the same expense per mile run, as a regular train engine. The extra power must be adapted to the load, and this may require more than one and less than two engines, consequently two must be employed. Two or three engines coupled to the same train, will not perform as much in proportion to their power, as if worked separately; and if the train is separated and made up into several smaller ones, delay and expense is incurred. The power must be provided for a full load; but a general trade will be more or less irregular, and as the trains working on a long road must move at regular times, they will not always be full loaded, and the average will fall considerably below the capacity of the engines. This remark applies to the question of power generally, and is not peculiar to the provision for extra power. We are of the opinion that this extra power, for the reasons above given, will cost not less than 50 per cent. per ton of freight per mile, more than that of engines in regular work, and carrying loads equal to their full capacity. The ratio of increase in cost from the considerations above stated, cannot be arrived at with certainty, and though we think it will exceed the regular computation more than 20 per cent., this ratio will be assumed in the following estimates.

(To be Continued.)

Saturday, March 20, 1847.

### MISSING NUMBERS

#### OF THE RAILROAD JOURNAL.

Subscribers, who wish to obtain Missing Numbers of Back Volumes of this Journal, will do well to apply BEFORE the 1st of APRIL next, as, after that period, they cannot be obtained!

### BOUND VOLUMES.

Volumes of this Journal, for the Years 1838 to 1846, INCLUSIVE, may be had Bound, at Subscription Price, on application at this Office.

One or two COMPLETE SETS of the RAILROAD JOURNAL may be had in a few weeks—or as soon as two numbers can be reprinted—by application to the Editor.

**PIG AND BLOOM IRON.**—THE SUBSCRIBERS are agents for the sale of numerous brands of Charcoal and Anthracite Pig Iron, suitable for Machinery, Railroad Wheels, Chains, Hollowware, etc. Also several brands of the best Puddling Iron, Juniata Blooms suitable for Wire, Boiler Plate, Axe Iron, Shovels, etc. The attention of those engaged in the manufacture of iron is solicited by

A. WRIGHT & NEPHEW,

121st Vine St. Wharf, Philadelphia.

### Atlantic and St. Lawrence Road.

A friend, writing us from the city of Portland, says—"You can have no idea of the real feeling which exists in this region, in reference to the subject of railroads in the State of Maine. The road hence to Waterville will be built—and the prospect now is, that it will be pushed forward at once, most vigorously. The Atlantic and St. Lawrence railroad is progressing finely. As you are of course aware, some forty miles of this road has been put under contract, at the Montreal end, and we are getting out of Portland with our road as fast as may be. The terminus in Portland will be at the foot of King (India) street—the old 'Steamboat Landing'—and the work of getting through, and round 'Observatory Hill,' is being got along with as rapidly as is practicable. It is no trifling job to get the work forward out of the city limits—but once fairly into 'open ground,' and we shall get along with rapid strides. A few years hence, (though it may scarcely be believed at present,) and Portland will rank but second in the list of Eastern seaports, or I mistake!"

### Oswego and Syracuse Railroad Charter.

Efforts are being made, latterly, in New York, to secure the charter of the Oswego and Syracuse railroad, by which a winter communication will be opened between Lake Ontario and the city of New York. The Courier and Enquirer, alluding to the subject, says—"as to the returns for the investment, there can be no doubt of its being as good a stock as any railroad in the State, for the travel, by the way

of Oswego to Canada and the Falls, would alone pay a good dividend. But \$50,000 is now required: Albany, Utica, and Syracuse having, within a week, taken \$80,000 of the stock. Interest will, we understand, be paid on instalments, at the rate of 7 per cent., till the road is in operation."

### Dry Dock at Brooklyn N. Y.

The government Dry Dock, in Brooklyn, N. Y., promises to be a most gigantic and splendid affair, when finished. It is thought, however, that it will cost more than the original estimate of one million of dollars. From the floor of the dock, the side walls of cut granite, 36 feet high, will spring, not perpendicularly, however, but by a succession of steps or "altars," thus allowing the chamber of the dock to increase in width as the walls rise, until the cavity which was only 30 feet wide at the bottom becomes 98 feet at top, and its length, 258 at bottom, elongates into 308 feet at the surface. This portion of the work alone, will require 100,000 stones, beside 4,000 tons of rubble. The dock will, when finished, accommodate a vessel 330 feet long, or the largest ship in the American navy. Its entrance will be closed by two gates, and the water removed by means of six or eight large pumps, each three or four feet in diameter.

### Saratoga and Lake Champlain.

Arrangements have been completed for the immediate prosecution of the railroad which will unite Saratoga Springs with Lake Champlain. The Saratoga Whig says:—

"The contract has been made with Messrs. Schuyler & Bishop, of New York, to complete the road to Fort Ann—on the canal 10½ miles this side of Whitehall—by July 1, 1848, including a heavy iron rail, for \$448,000. The contractors take \$100,000 of the stock in part payment. The effect has been to advance the value of the stock very much in this quarter. The company design to take immediate steps to complete the road to Whitehall, so that, if possible, it shall be completed nearly, if not quite as early as that at Fort Ann."

### Railroad Stocks.

The Boston Courier of Monday has the following quotations of the railway share market:

	Offered.	Asked.
Lowell railroad par \$500	580	590
Nashua do. do. 100	128	130
Concord do. do. 50	68	69
Fitchburg do. do. 100	121	122
Worcester do. do. 100	115½	116½
Maine do. do. 100	110	110½
Providence do. do. 100	104½	104½
Eastern do. do. 100	107	107½
Portland do. do. 100	100½	101
Old Col'ny do. do. 100	98½	99
Norwich do. do. 100	52½	52½

The Courier adds:—The State of Massachusetts having subscribed for its quota of new stock in the Western road, the stock has become firmer in the market, and is now worth one per cent. premium, in view of at least three and a half and possibly four per cent. dividend in July next. It is understood that no further issues of shares are to be made this year, until after that time, and then only enough to pay for about twenty miles of double track, which is to be built on a section of the road which needs it the most.

### Obstructions on Railroads.

At Trenton, on Wednesday last, Wm. Cubberly was tried for, and found guilty of, placing obstructions on the track of the Camden and Amboy railroad. He was sentenced to pay a fine of \$100! His cause of complaint against the company was, that a bull which belonged to him had been killed by the locomotive, and hence, we suppose, he thought he would kill some of the innocent passengers for

revenge on the company. The fine was certainly not at all proportionate to the enormity of the offence.

### Alexandria Canal.

The Virginia House of Delegates have, by a vote of 69 to 34, passed a bill providing for a subscription by the State of two-fifths of the stock of the Alexandria canal—equivalent to \$372,000. A bill is also before the same Legislature, providing for the State's guarantee of \$300,000 of the bonds of the Chesapeake and Ohio Canal company.

### Iron in Alabama.

The business of manufacturing iron is steadily spreading itself in Alabama. The Tuscaloosa Monitor states that beds of the finest ore are found to an incalculable extent in Tuscaloosa county, and it is ascertained to be superior to any in the south or west. An iron master of Tennessee, who compared it with his own, gives it the preference, both for quantity and quality.

### A Sentiment Worthy of Note.

In a letter authorizing a subscription of \$10,000 in his name for the New York and Albany railroad stock, Mr. PRATT, of Prattsville, concludes his brief note by saying, "I am happy to see that you are up and doing. As no dead man does any good, we must do it in our life time."

How few, says the Rochester American, duly consider the shortness of the time given them for doing whatever of good they hope to accomplish in this world! Wealthy men, like Stephen Girard, are too apt to leave for others, the execution of plans of institutions, and public works, which they ought to carry into effect according to their own better judgment.

Regarding man as an active agent for good, he has little claim to the world's respect, who shirks his duty in his life time, and leaves funds to be misapplied, or squandered by those that come after him.

Are there any who would enjoy the high satisfaction of aiding to found a creditable, and most useful University in Western New York? If so remember that dead men do little good, that it must be done, if at all, in your life time. Suppose no one was permitted to do good with his property, how much would it really be worth? By achieving a great good with a small fraction of it, may not the balance, or the whole be rendered doubly valuable? There is great propriety in urging the importance of "being up and doing" whatever our hands find to do, that should be done.

### Disconnecting Railroad Coupling.

Mr. Byington, one of the master mechanics at the U. S. Arsenal, says the New York Farmer and Mechanic, has called our attention to a most useful invention, for the safety of valuable lives. "It is called self-connecting and disconnecting railroad coupling. Too much cannot be said in its favor, in the way of commendation. I must confess, it far exceeds my utmost expectations, and is worthy of publication in all the Journals of the day. I will give some of its qualities. It can be set at any number of degrees so as to suit any or all curves or switches, on any of the railroads, but whenever a car makes any short turn other than the curves or switches, it immediately disconnects itself and lets go, and should one car run off the track, this coupling immediately disconnects itself and lets the car go, while the balance of the train remains on the track. It is also at the pleasure of the conductor or brakeman to disconnect one car from another while the train is at full speed, and the locomotive, with a full head of steam applied to its propulsion. Furthermore, it connects itself by running up one car against another

without the aid of any assistance whatever. I cannot conclude without calling the public, generally, and especially all railroad companies to have the said coupling brought into use. The safety of the travelling public demands it. It is certainly a useful invention for the purpose intended. I will merely add, that the Washington Branch of the Baltimore and Ohio railroad have one of these couplings now in use, and found it to work admirably. It is also very cheap, not exceeding in price the others in use on the same road."

#### Railroad Intelligence.

The Rochester American says that "the project of a railroad from Rochester to Corning, N. Y., through the valleys of the Genesee river, the Honeoye creek and lake and the Cohocton river, strikes us as by far the most direct, cheap and feasible one yet proposed for connecting the northern line of railroads with the New York and Erie; and it is needless to say that it is the one in which Rochester is most deeply—vitaly interested." The route is through an excellent and most productive country, and leads directly to the boundless wealth of the coal region.—There are many weighty considerations in favor of this work, to which we have not time to-day to advert. An account of a meeting of the citizens in relation to this subject, is given at length in our columns to-day.

We learn from the New York Sun that the Hudson River railroad company contemplate a rapid construction of their road. They expect to be able to give employment to eight thousand men as soon as the frost is out of the ground. The road will be commenced at several points simultaneously, and by completing it, as they hope to do, in 18 months, they enhance the value of the property, and make it a par stock almost immediately.

The Long Island route having discontinued its trains for the present, the only route now in operation between Boston and New York, is via Springfield and New Haven. The trip is made with great promptness, and travellers are carried through in admirable time. On Saturday afternoon the train from Boston carried down nearly 200 passengers, three large passenger cars being crowded, even the "Jim Crow" car being full.

An application was made on the part of the associated railroads from Buffalo to Albany, to the Western railroad corporation, for the loan of freight cars, for the transportation of merchandize from the west to Albany. The latter company was obliged to decline the application, on account of a demand for all the cars for the business of their own road. Two thousand tons of merchandize from the Western road, exclusive of 5,500 barrels of flour, were brought to Boston over the Western railroad last week. The increase of receipts upon the Western railroad, in the past fortnight, is about \$10,000.—The gross receipts in 1842, amounted to \$512,688; in 1843, \$573,892; in 1844, \$753,752; in 1845, \$813,480; and in 1846, \$954,000.

Mr. Appleton, the engineer employed in making the survey on the Androscoggin road, arrived with a part of his corps, as far as Winthrop village last Monday. The Maine Farmer says he reports a very favorable chance for constructing a road thus far. The distance on the line thus surveyed from the junction with the Atlantic and Montreal road at Danville, to Winthrop, is 26 miles.

The Bath Inquirer says the engineer of the Kennebec and Portland railroad has completed the organization of his corps, and is now on the route, progressing as rapidly as possible with his duties.

The Savannah Republican says: "We yesterday

received from a friend who resides at Macon, now in New York, a letter, stating that the stockholders of the Macon and Western road, have determined, in conjunction with the people of Columbus, to construct the railroad to Columbus forthwith. It is to be built for cash, and will be completed by the first of January, 1848, if possible. Our informant says there is 'no mistake,' and authorizes us to announce the fact. Three or four directors were to leave N. York immediately to meet the Columbus stockholders on the Flint river."

The Western railway company have petitioned the Legislature of Massachusetts to increase their capital to \$10,000,000, for the purpose of laying a second track; good evidence this of the increasing prosperity of one of the best conducted roads in this country. We are happy to learn that their prospects are so flattering.

We learn from the Bath Tribune, that the subscriptions to the Kennebec, Bath and Portland road now amount to \$800,000. The directors have laid an assessment of five per cent. on the stock to commence the work with.

The Haverhill, (Mass.) Gazette says that the freight train of cars on the Boston and Maine railroad will commence running to Lawrence next Monday. The Merrimack Courier, in reference to the amount of freight it will be necessary to transport over the road, says:

"We have before said that the Boston and Maine railroad must convey hither 150,000 bricks per day, for one hundred consecutive days, for the corporations alone. The transportation of these bricks alone will therefore afford to the railroad upwards of 230 tons of freight per day. The demand for timber, limestone, cement, etc., will amount to quite as heavy a transportation as that of the brick. At the present time the railroad is bringing to this place not over thirty thousand bricks per day, or less than one-third the quantity it ought to bring to supply the corporations. At this rate the road will have discharged its contracts with the companies sometime in 1848."

We have been informed that the Boston and Maine railroad are calculating to forward 900,000 bricks daily, besides other freight, so that we think there need be but little anxiety on that subject.

#### Massachusetts Annual Railroad Reports.

We are indebted to P. P. F. De Grand, Esq., Charles Minot, Esq., and Horace Williams, for a copy each of the Massachusetts Annual Railroad Reports. On referring to them, we find them much more detailed than those of previous years—the result, we perceive, of a law passed near the close of the last session of the Massachusetts Legislature.

We can well imagine that the companies will, for a time, find some difficulty in complying with the requisitions of this law—as it imposes much additional labor upon them—and requires an exposition of their operations—which some are unwilling to make. We doubt not, however, that much good will result to the cause, and that the public will be much pleased, by this new order of things. We give in this number the Sixteenth Annual Report of the Boston and Lowell railroad company, in all its detail, and shall follow it with most of the others contained in the pamphlet—to the number of twenty-eight.

We preface them by giving the Report of the Committee to the Legislature.

#### Commonwealth of Massachusetts.

IN SENATE, February 12, 1847.

The Joint Standing Committee on Railways and Canals, to which have been committed the annual reports of the railroad corporations of Massachusetts,

#### REPORT:

Twenty-eight railroad corporations have made their annual reports and returns. Of these, twenty-one appear to be made substantially in compliance with the Act of April 16, 1846. They do not, in all cases, contain all the details required to be furnished; but, in most instances, the reasons are given for failing to furnish said details.

The reports and returns of the following named corporations are not made in compliance with the said Act; to wit: the Eastern, Old Colony, Fall River, Boston and Maine, Norwich and Worcester, Lexington and West Cambridge. A portion of these are grossly defective.

The number of fatal accidents reported is nine; injuries not fatal, seven. Of the fatal accidents returned, five occurred on the Boston and Providence road, two on the Boston and Lowell, one on the Fitchburg, and one on the Connecticut River railroad. The Committee have reason to believe, that the return of accidents is very incomplete. They have the best reason for saying, that many accidents have occurred, of which no notice is taken by some of the corporations, in their returns.

The Committee deem it of the first importance, that the several railroad companies should so keep their books as to enable them to make their reports and returns in strict compliance with the Act of April 16, 1846; otherwise, that act will be of no practical value.

The Committee recommend that 2000 copies of said reports be printed for the use of the Legislature.

For Committee, S. A. HULBERT.

SENATE, Feb. 12, 1847.

Accepted, and ordered accordingly.

Sent down for concurrence.

CHAS. CALHOUN, Clerk.

HOUSE OF REPRESENTATIVES;

Feb. 12, 1847.

Concurred. C. W. STOREY, Clerk.

SIXTEENTH ANNUAL REPORT OF THE BOSTON AND LOWELL RAILROAD CORPORATION.

To the Honorable the Legislature of the Commonwealth of Massachusetts:

The Directors of the Boston and Lowell Railroad Corporation do hereby make the Sixteenth Annual Report of their acts and doings, under their act of incorporation, in the within return to the form prescribed by the Act of the Legislature, passed April 6th, 1846.

All of which is respectfully submitted.

Wm. Sturgis, Geo. W. Lyman, Joseph Tilden, J. A. Lowell, Jonathan Chapman—  
Directors.

Boston, November 30th, 1846.

SUFFOLK, ss. January 6th, 1847. Then personally appeared the aforementioned William Sturgis, George W. Lyman, Joseph Tilden, John A. Lowell, and Jonathan Chapman, and severally made oath that the within return by them subscribed was true, according to their best knowledge and belief.

Before me, J. THOS. STEVENSON,  
Justice of the Peace.

Return of the Boston and Lowell Railroad, under the Act of April 16th, 1846.

Capital stock	\$1,800,000 00
Increase of capital since last report	
Capital paid in, per last report	1,800,000 00
Capital paid in since last report

For engineering and other expenses, paid during the past year	
Total amount expended for engineering and other expenses	84,745 01
Total cost of road and equipment	1,940,418 00

## CHARACTERISTICS OF ROAD.

Length of road	25 1/2 miles and 59-71 ft.
Length of single track	Nothing.
Length of double track	25 1/2 miles and 59-71 ft.
Length of branches owned by the company, stating whether they have a single or double track	{ 1 1/2 miles and 585-33 ft. [single track.]
Weight of rail per yard in main road	{ 2 m's track 45 lbs. pr. yd. 2 1/2 " " 56 " " 2 " " 63 " "
Weight of rail per yard in branch roads	56 lbs. per yard.
Maximum grade, with its length in main road, [except about 1500 feet of 30 feet per mile grade, rising from the depot in Lowell]	10 ft. per mile for 6-08 m's.
Maximum grade, with its length in branch roads	54 ft. per mile for 5000 ft.
Total rise and fall in main road	189-93 feet.
Total rise and fall in branch roads	73-54 feet.
Shortest radius of curvature, with length of curve in main road, [except about 900 feet of 1200 feet radius, at the depot in Lowell]	2800 ft. R. 1694 ft. long.
Shortest radius of curvature, with length of curve in branch roads, [except two short curves of 500 and 625 feet radius, at the Woburn depot]	1975 ft. R. 662 ft. long.
Total degrees of curvature in main road	665° 1' 43"
Total degrees of curvature in branch roads	107° 40'
Total length of straight line in main road	18 1/2 miles and 834 ft.
Total length of straight lines in branches	1 1/2 miles and 491 feet.
Aggregate length of truss bridges	54 feet.
Whole length of road unfinished on both sides	Nothing.

## BOUNCE DURING THE YEAR.

Miles run by passenger trains	134,633
Miles run by freight trains	59,972
Miles run by other trains	13,236
Total miles run	900,841

Number of passengers carried in the cars	400,886
Number of passengers carried one mile	8,411,437
Number of tons of merchandize carried in the cars	222,931
Number of tons of merchandize carried one mile	5,626,777
Number of passengers carried one mile, to and from other roads	2,483,806
Number of tons carried one mile, to and from other roads	2,878,226
Average rate of speed adopted for passenger trains, including stops, [including special trains]	21 9-10 miles per hour.
Average rate of speed adopted for freight trains, including stops	12 miles per hour.
Estimated weight in tons of passenger trains, including engine and tender, but not including passengers hauled one mile	6,397,760
Estimated weight of merchandize trains, including engine and tender, but not including freight, hauled one mile	6,052,580

## EXPENDITURES FOR WORKING THE ROAD.

For repairs of road, maintenance of way, exclusive of wooden truss bridges and renewals of iron	\$32,619 00
For repairs of truss bridges	42 56
For renewals of iron, including laying down	3,541 59
For wages of switch-men, gate-keepers and flag-men	4,241 85
For removing ice and snow	1,121 50
For repairs of fences, gates, houses for flag-men, gate-keepers, switch-men, tool-houses	734 80
Total for maintenance of way	42,301 20
MOTIVE POWER.	
For repairs of locomotives	\$11,599 16
For new locomotives to cover depreciation	10,000 00
For repairs of passenger cars	6,750 96
For new passenger cars to cover depreciation	5,484 50
For repairs of merchandise cars	5,180 37
For new merchandise cars to cover depreciation	12,023 68
For repairs of gravel and other cars	1,844 15
Total for maintenance of motive power	52,882 84

## MISCELLANEOUS.

For fuel and oil	30,157 01
For salaries, wages and incidental expenses, chargeable to passenger department	16,801 05
For salaries, wages and incidental expenses, chargeable to freight department	22,998 54
For gratuities and damages	873 73
For taxes and insurance	1,709 30
For ferries	6 00
For repairs of station building, aqueducts, fixtures, furniture	26,567 88
For interest	4,246 87
For amount paid other companies in tolls for passengers and freight carried on their roads, specifying each company	
For amount paid other companies as rent for use of their roads, specifying each company	
For salaries of president, treasurer, superintendent, law expenses, office expenses of the above offices, and all other expenses not included in any of the foregoing items	13,676 03
	117,049 50

## INCOME DURING THE YEAR.

For Passengers:	
1. On the main road exclusively, including branch owned by company	139,505 72
2. To and from other roads, specifying what:	
Lowell and Nashua railroad	\$16,743 40
Concord railroad	26,986 67
	45,729 07
For Freight:	
1. On main road and branches owned by company	197,604 87
2. To and from other connecting roads:	
Lowell and Nashua railroad	\$20,021 04
Concord railroad	46,210 54
	66,231 58
U.S. mails, \$4,856 05. Rents, \$175 00	193,836 45
	5,031 05
Total income	384,102 29
Net earnings after deducting expenses	171,968 67
DIVIDENDS.	
Two of four per cent, each	144,000 00
Surplus not divided	27,868 67
Surplus last year	123,458 90
Total surplus	\$151,327 57
ESTIMATED DEPRECIATION BEYOND RENEWALS, VIZ:	
Road and bridges	
Buildings	
Engines and cars	

Three serious accidents to persons have occurred on the Boston and Lowell railroad in 1846, viz:

On the 13th of August, Charles Adams, 16 years old, was killed at Lowell, in attempting to jump on to a freight car in motion.

On the 8th of October, Maria Fagan, 17 years old, was killed at Lowell, by being run over, at the crossing of the south sidewalk in Lowell street, by a freight car which was going down the track towards the passenger house.

On the 16th of November, an intoxicated person, in attempting to get on to a passenger car, at the depot in Boston, after the train had started, fell under it, and one leg was crushed by the wheels in such a manner as to require amputation.

#### Monongahela Company.

The recent annual report of the Monongahela Navigation company exhibits the amount of travel over this route for the last two years, as follows:—

	1845.	1846.	Increase.
Through passengers.....	22,727	31,934	12,258
Way passengers.....	30,675	30,268	9,504

Total.....43,501. 65,252. 21,831

This statement shows a very large business in the transportation of passengers. The Pittsburgh Chronicle says:—

"The stage company, of which Mr. J. Meskimen is the agent, on Monday next start three boats which will hereafter run regularly between Pittsburgh and Brownsville. The passage office for Baltimore, Philadelphia and intermediate points, is in the basement of the St. Charles Hotel. One of these boats will leave at 8 o'clock A. M., another at 4 P. M., and the third will do the way business. This arrangement will greatly expedite the quickness of the trip from here to Brownsville, of the passengers going east, and will, no doubt, greatly increase the business of this already favorite line."

#### Boston and Albany Road.

The following statements show the business of the Boston and Albany railway for the last two months, compared with the corresponding period in 1845-6.

	1845-6.	1846-7.
Passengers.....	\$48,717 93	\$30,009 93
Freight.....	77,643 69	109,680 54
Other sources.....	5,242 69	4,948 66

\$131,504 31. 164,638 13  
131,504 31

Increase.....\$33,133 82

#### Chesapeake and Ohio Canal.

The following is an authentic copy of the Act recently passed by the Legislature of Virginia in reference to this company.

*An Act authorizing the State's guarantee to certain Bonds of the Chesapeake and Ohio Canal Company. (Passed March 8, 1847.)*

Whereas, by an act of the General Assembly of Maryland, passed the tenth day of March, eighteen hundred and forty-five, entitled "An Act to provide for the completion of the Chesapeake and Ohio Canal to Cumberland, and for other purposes," the President and Directors of the Chesapeake and Ohio canal company were authorized to borrow upon the bonds of the said company, with preferred liens on its revenues, such sums of money as might be required to pay for the completion of the said canal to Cumberland, under a contract or contracts thereafter to be made by the President and Directors of said company. And, whereas,

it has been represented to the General Assembly of Virginia that in pursuance of the said act, the said President and Directors, under a contract for that purpose, have made arrangements to raise the amount of money necessary for the completion of the said canal to Cumberland, provided the further sum of three hundred thousand dollars can be procured:

Be it therefore enacted by the General Assembly of Virginia, That to enable the said President and Directors, or their contractors, to complete the said arrangements, and to raise the said sum of three hundred thousand dollars in the mode and for the purpose aforesaid, the treasurer of this Commonwealth be, and he is hereby authorized and required to subscribed or endorse the guarantee of this State to the bonds of the said Chesapeake and Ohio canal company, to be issued in pursuance of the said act of the General Assembly of Maryland, to an amount not exceeding three hundred thousand dollars, to the effect following:

"I, A. B., treasurer of the Commonwealth of Virginia, in conformity to act of the General Assembly passed on the day of , in the year eighteen hundred and forty-seven, do hereby pledge the faith of the State for the punctual payment of the interest, and the ultimate redemption of the principal sum of money appearing by the within (or above) bond, according to the terms therein specified.

"In testimony whereof, I have hereunto set my hand and affixed my seal of office, at Richmond, Virginia, this day of eighteen . A. B., Treasurer."

Provided, however, That the said guarantee shall not be so subscribed or endorsed by the said treasurer, until it shall be shown to the satisfaction of the Board of Public Works of this Commonwealth, by the President and Directors of the said Chesapeake and Ohio canal company, or their contractors, that the said sum of three hundred thousand dollars will secure the completion of the said canal to Cumberland, and that the revenues of the said company be pledged by the said act of the General Assembly of Maryland, to the payment of the principal and interest of the bonds issued in pursuance thereof, will, when the said canal shall be so completed, be sufficient for that purpose. Provided also, That the said Board of Public Works shall be further satisfied that the interest which may accrue upon the said guaranteed bonds while the said canal is in the progress of completion to Cumberland, will be paid by the said Chesapeake and Ohio canal company, or their contractors.

This act shall be in force from its passage.

#### Meeting at West Bloomfield.

A large and respectable meeting of delegates from the four counties of Monroe, Livingston, Ontario and Steuben, was held at West Bloomfield on the 4th inst., to take into consideration the subject of constructing a railroad from this city to Corning, in Steuben county, to intersect at that point the N. Y. and Erie, and Blossburg railroads. Hon. THOMAS KEMPSTALL, of Rochester, was called to the chair. Robert L. Ross, of Ontario,

James Smith, of Montee, Thos. Grove, of Livingston, Edward Hall, of Steuben, and Lyman Hawes, of Ontario, were chosen Vice Presidents; and James L. Mosier, of Ontario, and Jasper W. Gilbert, of Rochester, appointed Secretaries.

The number of delegates in attendance was sufficient to fill a good sized meeting house, and all seemed to feel a deep interest in the enterprise for the promotion of which they had assembled from distant counties. As is very natural, the friends of rival routes urged the respective claims and advantages of each with much earnestness. This was done, however, in good temper. Many interesting facts were elicited during the discussion, in which Messrs. Stuart, Traver, Pitts, McGee, Patchin, Z. Barton Stout, Pratt, Patterson, and others participated.

The distance from this city to New York, via the proposed road, is 62 miles less than by way of Albany. The length of the road from Rochester to Corning will be in the neighborhood of 80 miles—more than half the distance is through the valleys of the Genesee, Honeoye and other streams, which water a country of surpassing fertility. The local business in the way of freight and travel which this road will command must be immense, as any one acquainted with the hydraulic power of the Honeoye, and the productiveness of the soil in wheat and other grain will attest. The three counties of Monroe, Livingston and Ontario produced in 1844 no less than 3,078,963 bushels of wheat—With a wide track, heavy rail and easy grades from this city, the heart of the wheat growing region of Western New York, direct to the metropolis of the State and Union, a large freighting business can be done in the season when the canal is closed, if not the year round. If a richer country, or one possessing greater natural resources can be found through which to construct an iron way, than the one indicated, to commence at the lake and river harbor in this city and pass through Monroe, Livingston, Ontario and Steuben counties, we should be glad to see it pointed out.

To reach the summit level of the streams that flow in either direction, north into Lake Ontario, and south into the Susquehanna, the grade of a road need not exceed at any place 30 feet ascent in the mile. Allowing that flour can be carried as cheaply per mile from this city to New York over the Rochester and Corning and N. Y. and Erie roads as it is now transported from Troy to Boston, the expense will be only sixty-three cents a barrel. The distance saved in going directly from this to Corning, rather than by the way of Canandaigua, is 20 miles, beside the advantage of having a five feet track from the steamboat landing in this city, for taking freight from Canada and the great west, and sending it over the N. Y. and Erie road to the sea board.

With its easy grades over the summit into the valley of the Conhocton, this route can be made a great thoroughfare for the commerce of the Lakes, to say nothing of its peculiar advantages for commanding way travel

and freight. It will also be an important link in the iron chain commencing at the western coast of the peninsula of Michigan, if not at the Mississippi river, and running to Detroit, thence through Canada to the Falls, over a suspension bridge, and the Niagara and Lockport road, and on to this city. This route from the Upper Mississippi to the city of New York is many miles shorter than any other, and, as a whole, remarkably level, and is well calculated for quick time, and carrying heavy loads.

The following resolutions, offered by Mr. J. W. Gilbert of Monroe, were unanimously adopted by the Convention in place of those reported by the committee on resolutions:

Resolved, That this Convention is in favor of the construction of a railroad by the most direct and feasible route, from the city of Rochester through the counties of Monroe, Ontario, Livingston and Steuben, to the New York and Erie railroad, at or near Corning, in the county of Steuben.

Resolved, That a committee of three from each county represented be appointed, whose duty it shall be to take the necessary measures to procure a charter for such road; to raise funds by subscriptions in order to an immediate survey of a line of said road, and to make such publications as may be necessary in order to fully communicate to the public the advantages of such road, and to report at a future convention a detailed plan for the construction of such road, including the routes thereof, and the reasons for adopting the same.—*Rochester American.*

#### A Western Railroad.

The *Pittsburg Gazette* gives the following in relation to a railroad west. The remarks will show in some degree, what is the state of feeling in that quarter, in reference to the question which has been the cause of so much interest there for the last year or two—the "right of way."

"We are pleased to learn," says the *Gazette*, "that the public mind in this city, is firmly settling down in favor of expending all our means and energies in the prosecution of a western railroad, and of going to work at once and in earnest. There is, we admit, a disinclination among a few to relinquish all hopes of a connection with Baltimore so long and so fondly dwelt upon. Baltimore, when she cast off Pittsburg so rudely, committed an act of folly, the whole consequence of which she will not probably realize for years to come, and lost the friendship of those who would have gone to any reasonable length to have secured a railroad connection, and a community of interests with her.

"But it is to be presumed she is the best judge of her own interests; at least she has the control of them, and there is not a man in Pittsburg who would solicit a renewal of negotiations after what is past. There is a few, we say, who cannot give up all hope that Baltimore will see her true interests, and accept of the Connelleville charter on Pittsburg terms—none would think of a union on any other. However, the number of such is becoming daily less. We have but little doubt that at the next meeting of the Pittsburg stockholders, they will resolve to give up the

right to connect with Baltimore, and bend all their energies to the western project. It is important that we should relinquish entirely and definitely all intention, and even the power, to connect with Baltimore, that we may secure a loneliness and fixedness of purpose, and avoid the danger which ever flows from divided counsels.

"Baltimore may some day secure the right of way through Virginia, and we owe it to ourselves to hasten to counteract any injurious influence such an event would have upon our interests. Philadelphia will doubtless prosecute her great Pennsylvania railroad with a spirit worthy of the magnitude and importance of the undertaking. We presume she will put it under contract as rapidly as the line can be prepared by the engineers. Let us be prepared to open a railroad to the interior of Ohio, before, or at least by the time she opens one to Philadelphia, and Pittsburg will then be set on a foundation which no railroad terminating south of us can effect.—What, with improvements to the river, and light draft boats, and a railroad tapping all the improvements in Ohio, with the full command of the lake trade, (for Baltimore could not reach the lakes without crossing our road) we should be perfectly secure against all injurious competition, and be placed on a pinnacle of prosperity which no southern improvement could rob us of."

#### "Electro Magnetic Engine."

JOHN H. LALLÉ, Esq., of Pittsburg, has invented a machine which he believes he has so far perfected as almost to demonstrate the practicability of using the electric fluid as a motive power. He thinks he has discovered a practical principle whereby he can use this mysterious, subtle and powerful element, to propel machinery, boats, railway trains, etc. The machine is styled by Mr. L. the "Electro-Magnetic Engine." The *Pittsburg Gazette*, speaking of the invention, says:—

"Mr. LALLÉ informs us that he is now building a large and splendid model machine, of which the 'fly' or balance will weigh 8 pounds. We were favored by him with an examination of a small machine while running. With a small battery it worked to admiration, running very fast. The question is, whether it can be made applicable in practice and on an extensive scale? This is to be solved by further experiments.

"We are met with a usual difficulty in attempting to convey an idea of a new invention without the aid of cuts, or a familiar acquaintance with technical terms. The insuperable obstacle in perfecting all such machines, has been to gain 'stroke.' The motion communicated by the piston of a steam engine to the 'fly' wheel is 'stroke.' We say of a steam engine, it is 2, 4, or 8 feet stroke. In this machine this appears to be accomplished. The magnets are arranged in tiers ascending from the centre. A rack, working on a centre axle, supports strips of iron over the magnets. To illustrate the operation, imagine one of our fire engines at work. The power is by weight alternately applied to levers at each end of the arms. Suppose, instead of levers, there were pieces of iron of broad surface, and a number of

very large and powerful magnets arranged under each end. When in operation, the positive and negative poles of the magnets would alternately attract and repel, and the motion would be the same—precisely like men working it. Here is the power attained.

"From the axle, to which the arms of the rack are securely fastened, an arm extends downwards, and a shaft from the end of that to the end of the crank on the fly or balance wheel, communicates motion to machinery, just as in the steam engine from the end of the piston rod, working on slides. The machinery of Mr. Lallé's is as simple as can be imagined.

"It is obvious that if this engine is ever made applicable to mechanical purposes, it must revolutionize all motive power, except, perhaps, water. There is no waste or loss in its application. It can be started and stopped in a moment. The instant it is stopped all expense ceases. The fuel is simply metal and acids, and the expense for these, from recent discoveries, is reduced to a comparatively small cost. There are many other advantages which we need not enumerate. Of one thing every person who sees it will be satisfied—there is no deception about it. It is understood at a glance. The question of its practical use is yet to be settled. Mr. L. informs us that the small model has power sufficient for a watch maker's lathe. He has lodged a caveat in the patent office to secure his invention."

**Hudson River Railroad.**—The New York papers contain a notice from the Commissioners of the contemplated railroad from N. York to Albany, that the subscriptions to that important work are yet deficient in the sum of \$750,000, to make up the required sum of \$3,000,000. This deficiency must be subscribed during the present week, or the charter, which is said to be more valuable than any that can hereafter be obtained, will be lost.

**Ohio Roads.**—The Columbus Journal of 2d instant, says: "A meeting of the citizens of Franklin county has been notified to be held at the Old Court House, in this city, on the 3d of March, to consult upon the subject of constructing a railroad to connect this city and county with Cincinnati on the south, and Cleveland on the north." The bill, granting charters to the Louisville and Frankfort and Lexington Licking Valley railroad companies, has passed both branches of the Kentucky Legislature.

**RAILROAD IRON.—THE "MONTGOMERY" Iron Company,** Danville, Pa., is prepared to execute orders for the heavy Rail Bars of any pattern now in use, in this country or in Europe, and equal in every respect in point of quality. Apply to **MURDOCK, LEAVITT & CO.,**

1748

77 Pine St., New York.

**RAILWAY IRON.—DAVIS, BROOKS & Co.,** No. 68 Broad Street, have now in port on Ship-board, 200 Tons of the best English heavy H Rails, 60 lbs. to the lineal yard, which they offer for sale on favorable terms, also, about 6 to 700 Tons now on the way, to arrive shortly, of the same description of Rail.

**NICOLL'S PATENT SAFETY SWITCH** for Railroad Turnouts. This invention, for some time in successful operation on one of the principal railroads in the country, effectually prevents engines and their trains from running off the track at a switch, left wrong by accident or design.

It acts independently of the main track rails, being laid down, or removed, without cutting or displacing them.

It is never touched by passing trains, except when in use, preventing their running off the track. It is simple in its construction and operation, requiring only two Castings and two Rails; the latter, even if much worn or used, not objectionable.

Working Models of the Safety Switch may be seen at Messrs. Davenport and Bridges, Cambridgeport, Mass., and at the office of the Railroad Journal, New York.

Plans, Specifications, and all information obtained on application to the Subscriber, Inventor, and Patentee  
**G. A. NICOLLS,**  
Reading, Pa.

**RAILROAD IRON.—THE SUBSCRIBER'S** New Rail Iron Mill at Phoenixville, Pa., is expected to be ready to go into operation by the 1st of September, and will be capable of turning out 30 to 40 tons of finished Rails per day. They are now prepared to receive orders to that extent, deliverable after the 1st of October next, for heavy rails of any pattern now in use, equal in quality and finish to best imported.

**PIG IRON**—They are also receiving weekly 150 to 300 tons of No. 1 Phoenix Foundry Iron, well adapted for light castings.

**REEVES, BUCK & CO.,**  
45 North Water St., Philadelphia,  
or by their Agent, **ROBT. NICHOLS,**  
79 Water St., New York.

**THE SUBSCRIBERS, AGENTS FOR**  
the sale of  
Codorus,  
Glendon,  
Spring M. and  
Valley,  
Pig Iron.

Have now a supply, and respectfully solicit the patronage of persons engaged in the making of Machinery, for which purpose the above makes of Pig Iron are particularly adapted.

They are also sole Agents for Watson's celebrated Fire Bricks and prepared Kaolin or Fire-Clay orders for which are promptly supplied.

**SAM'L KIMBER & CO.,**  
59 North Wharves,  
Jan. 14, 1846, [1y4] Philadelphia, Pa.

**RAY'S EQUALIZING RAILWAY TRUCK.—THE SUBSCRIBER** having recently formed a business connection, in the City of New

York, expressly for the manufacture of the newly patented and highly approved Railroad Truck of Mr. Fowler M. Ray, is ready to receive orders for building the same, from Railroad Companies and Car Builders in the United States, and elsewhere.

The above Truck has now been in use from one to two years on several roads a sufficient length of time to test its availability, and other good qualities, and to satisfy those who have used it, as may be seen by reference to the certificates which follow this notice.

There have been several improvements lately introduced upon the Truck, such as additional springs in the bolster of passenger cars, making them delightful riding cars—adapting it to tenders, trucks forward of the locomotive, and freight cars, which, with its original good qualities, make it in all respects the most desirable truck now offered to the public.

Orders for the above, will, for the present, be executed at the New York Screw Mill, corner 33d street and 3d avenue, (late P. Cooper's rolling mills) and at the Steam Engine Shop of T. F. Secor & Co., foot of 9th street, East

**RAILROAD IRON.—THE NEW JERSEY** Iron Company, Boonton, N. J., are now preparing to make Railroad Bars, and are ready to take orders or make contracts for Rails, deliverable after the first of December next. Apply to  
**FULLER & BROWN, Agent,**  
No. 139 Greenwich, corner of Cedar street.  
September 18, 1846. 10139 41f

**LAWRENCE'S ROSENDALE HYDRAULIC** Cement. This cement is warranted equal to any manufactured in this country, and has been pronounced superior to Francis' "Roman." Its value for Aqueducts, Locks, Bridges, Floors and all Masonry exposed to dampness, is well known, as it sets immediately under water, and increases in solidity for years.

For sale in lots to suit purchasers, in tight paper-barrels, by  
**JOHN W. LAWRENCE,**  
142 Front street, New York.

Orders for the above will be received and promptly attended to at this office. 3917

**ENGLISH PATENT WIRE ROPES FOR THE USE OF MINES, RAILWAYS, ETC.—** for sale or imported to order by the subscriber.

These Ropes are manufactured on an entirely different principle from any other, and are now almost exclusively used in the collieries and on the railways in Great Britain, where they are considered to be greatly superior to hempen ones, or iron chains, as regards safety, durability and economy. The plan upon which they are made effectually secures them from corrosion in the interior, as well as the exterior of the rope, and gives a greater compactness and elasticity than is found in any other manufacture.

Many of these ropes have been in constant operation in the different mines in England, and on the Blackwall and other inclined planes, for three and four years, and are still in good condition.

They have been applied to almost every purpose for which hempen ropes have been used—mines, heavy cranes, standing rigging, window cords, lightning conductors, signal halyards, tiller ropes, etc. Reference is made to the annexed statement for the relative strength and size. Testimonials from the most eminent engineers in England can be shown as to their efficiency, and any additional information required respecting the different descriptions and application will be given by

**ALFRED L. KEMP,**  
75 Broad street, New York, sole agent in the United States.

*Statement of Trial made at the Woolwich Royal Dock Yard, of the Patent Wire Ropes, as compared with Hempen Ropes and Iron Chains of the same strength.—October, 1841.*

WIRE ROPES.				HEMPEN ROPES.				CHAINS.		STRENGTH
Wire gauge number.	Circumference of rope.	Weight per fathom.		Circumference of rope.	Weight per fathom.			Weight per fathom.	Diameter of iron.	
	INCH.	LBS. OZ.		INCH.	LBS. OZ.			LBS.	INCH.	Tons.
11	4½	13 5		10	24 -			50	15-16	20

16	2½	4 3		6	8 8			10½	7-16	7

N.B. The working load, with a perpendicular lift, may be taken at 6 cwt. for every lb. weight per fathom, so that a rope weighing 5 lbs. per fathom would safely lift 3360 lbs., and so on in proportion. 1y24

river, (of which firm the subscriber was late a partner) under the immediate supervision of Mr. Ray himself.

Several sets of trucks containing the latest improvements have recently been turned out for the New York and Erie railroad, and the New Jersey Transportation company, which may be seen upon said roads.

The patronage of Railroad Companies and Car Builders is respectfully solicited.

New York, May 4, 1846. W. H. CALKINS, and Others.  
To all whom it may concern:—This is to certify that the New Haven, Hartford and Springfield railroad co., have had in use six sets of F. M. Ray's patent trucks for the last 20 months, during which time it appears to me, they have proved to be the best and most economical truck now in use.

[Signed.] **WILLIAM ROE, Supt of Power.**  
I certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Philadelphia and Reading railroad for some time past, under a passenger car.

For simplicity of construction, economy in cost, lightness of material, and extreme ease of motion, I consider it the best truck we have ever used. Its peculiar make also renders it less liable to be thrown off the track, when passing over any obstruction. We intend using it extensively under the passenger and freight cars of the above road.

Reading, Pa., October 6, 1845. [Signed.] **G. A. NICHOLLS,**  
Supt Transportation, etc., Philadelphia and Reading Railroad.

To all whom it may concern:—This is to certify that the N. Jersey Railroad and Transportation company have used Fowler M. Ray's Truck for the last seven months, during which time it has operated to our entire satisfaction. I have no hesitation in saying that it is the simplest and most economical truck now in use.

[Signed.] **T. L. SMITH,**  
Jersey City, November 4, 1845. N. Jersey Railroad and Transp. Co.

This is to certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Long Island railroad for the last year, under a freight car.

For simplicity of construction, economy in cost, lightness of material and ease of motion, I consider it equal to any truck we have in use.

Long Island Railroad Depot, [Signed.] **JOHN LEACH,**  
Jamaica November 13, 1845. 1y19 Supt Motive Power.

# **RICH & CO'S IMPROVED PATENT SALAMANDER SAFES.**

Warranted free from dampness, as well as fire and thief proof.

Particular attention is invited to the following certificates, which speak for themselves:

## **TEST No. 10.**

*Certificate from Mr. Silas C. Field, of Vicksburg, Mississippi.*

On the morning of the 14th ult., the store owned and occupied by me in this city, was, with its contents, entirely consumed by fire. My stock of goods consisted of oil, rosin, lard, pork, sugar, molasses, liquors, and other articles of a combustible nature, in the midst of which was one of Rich's Improved Patent Salamander Safes, which I purchased last October of Mr. Isaac Bridge, New Orleans, and which contained my books and papers. This safe was red hot, and did not cool sufficiently to be opened until 16 hours after it was taken from the ruins. At the expiration of that time it was unlocked, when its contents proved to be entirely uninjured, and not even discolored. I deem this test sufficient to show that the high reputation enjoyed by Rich's Safes is well merited.

S. C. FIELD.

## **TEST No. 11.—Certificate.**

By the fire which occurred in this village on the 27th July last, our Law Office, together with many other buildings, was destroyed—we had in our office one of Rich's Improved Patent Salamander Safes, which, though heated red hot, preserved, without being the least damaged, many papers valuable to our clients—the envelopes of a few papers being slightly scorched. Some twenty-four hours after the fire, the safe was removed, and so hot was it, that several hours were required for it to cool off. Our office was in the second story of a large brick building, all the wood used in construction of said house being pitch pine. While the safe was red hot, one of the walls tumbled in, and so injured the lock that it was necessary to break the door open. From this test, we feel no hesitancy in recommending "Rich's Patent Salamander Safe" as entirely fire proof.

GORRE & KING.

Marion, Ala., Sept. 15th, 1846.

*Still other Tests in the Great Fire of July 19, 1845.*

The undersigned purchased of A. S. Martin, No. 138 1/2 Water street, one of Rich's Improved Patent Salamander Safes, which was in our store, No. 54 Exchange place. The store was entirely consumed in the great conflagration on the morning of the 19th inst. The safe was taken from the ruins 52 hours after, and on opening it, the books and papers were found entirely uninjured by fire, and only slightly wet—the leather on some of the books was perched by the extreme heat.

RICHARDS & CROOKRITT.

Benton, Miss., December 27, 1845.

One of Rich's Improved Salamander Safes, which I purchased on the 31 of June last of A. S. Marvin, 138 1/2 Water street, agent for the manufacturer, was exposed to the most intense heat during the late dreadful conflagration. The store which I occupied, No. 46 Broad street, was entirely consumed; the safe fell from the 2d story, about 15 feet, into the cellar, and remained there 14 hours, and when found, I am told, and from its appearance afterwards, should judge that it had been heated to a red heat. On opening it, the books and papers were found not to have been touched by fire. I deem this ordeal sufficient to confirm fully the reputation that Rich's safe has already obtained for preserving its contents against all hazards.

(Signed.)

WM. BLOODGOOD.

New York, 21st July, 1845.

Reference made to upwards of nine hundred and fifty merchants, cashiers, brokers, and officers of courts and counties, who have Rich's Safe's in use.

The above safes are finished in the neatest manner, and can be made to order at short notice, of any size and pattern, and fitted to contain plate, jewelry, etc. Prices from \$50 to \$300 each. For sale by

A. S. MARVIN, General Agent,

138 1/2 Water st., N. Y.

Also by Isaac Bridge 76 Magazine street, New Orleans.

Also by Lewis M Hatch, 190 Meeting street Charleston, S. C.

164

# **FRENCH AND BAIRD'S PATENT SPARK ARRESTER.**

**TO THOSE INTERESTED IN** Railroads, Railroad Directors and Managers are respectfully invited to examine an improved SPARK ARRESTER, recently patented by the undersigned.

Our improved Spark Arresters have been extensively used during the last year on both passenger and freight engines, and have been brought to such a state of perfection that no annoyance from sparks or dust from the chimney of engines on which they are used is experienced.

These Arresters are constructed on an entirely different principle from any heretofore offered to the public. The form is such that a rotary motion is imparted to the heated air, smoke and sparks passing through the chimney, and by the centrifugal force thus acquired by the sparks and dust they are separated from the smoke and steam, and thrown into an outer chamber of the chimney through openings near its top, from whence they fall by their own gravity to the bottom of this chamber; the smoke and steam passing off at the top of the chimney, through a capacious and unobstructed passage, thus arresting the sparks without impairing the power of the engine by diminishing the draught or activity of the fire in the furnace.

These chimneys and arresters are simple, durable and neat in appearance. They are now in use on the following roads, to the managers and other officers of which we are at liberty to refer those who may desire to purchase or obtain further information in regard to their merits:

R. L. Stevens, President Camden and Amboy Railroad Company; Richard Peters, Superintendent Georgia Railroad, Augusta, Ga.; G. A. Nicolls, Superintendent Philadelphia, Reading and Pottsville Railroad, Reading, Pa.; W. E. Morris, President Philadelphia, Germantown and Norristown Railroad Company, Philadelphia; E. B. Dudley, President W. and R. Railroad Company, Wilmington, N. C.; Col. James Gadsden, President S. C. and C. Railroad Company, Charleston, S. C.; W. C. Walker, Agent Vicksburg and Jackson Railroad, Vicksburg, Miss.; R. S. Van Rensselaer, Engineer and Supt Hartford and New Haven Railroad; W. R. M'Kee, Supt Lexington and Ohio Railroad, Lexington, Ky.; T. L. Smith, Supt New Jersey Railroad Trans. Co.; J. Eliott, Supt Motive Power Philadelphia and Wilmington Railroad, Wilmington, Del.; J. O. Sterns, Supt Elizabethtown and Somerville Railroad; R. B. Cayler, President Central Railroad Company, Savannah, Ga.; J. D. Gray, Supt Macon Railroad, Macon, Ga.; J. H. Cleveland, Supt Southern Railroad, Monroe, Mich.; M. F. Chittenden, Supt M. P. Central Railroad, Detroit, Mich.; G. B. Fisk, President Long Island Railroad, Brooklyn.

Orders for these Chimneys and Arresters, addressed to the subscribers, care Messrs Baldwin & Whitney, of this city or to Hinkley & Drury, Boston, will be promptly executed.

FRENCH & BAIRD.

N. B.—The subscribers will dispose of single rights, or rights for one or more States, on reasonable terms.

Philadelphia, Pa., April 6, 1844.

.. The letters in the figures refer to the article given in the Journal of June, 1844. ja45

## **PATENT HAMMERED RAILROAD, SHIP AND BOAT SPIKES.**

The Albany Iron and Nail Works have always on hand, of their own manufacture, a large assortment of Railroad, Ship and Boat Spikes, from 9 to 19 inches in length, and of any form of head. From the excellence of the material always used in their manufacture, and their very general use for railroads and other purposes in this country, the manufacturers have no hesitation in warranting them fully equal to the best spikes in market, both as to quality and appearance. All orders addressed to the subscriber at the works, will be promptly executed.

JOHN F. WINSLOW, Agent.

Albany Iron and Nail Works, Troy, N. Y. The above spikes may be had at factory prices, of Erastus Corning & Co., Albany; Hart & Merrii, New York; J. H. Whitney, do.; E. J. Eting, Philadelphia; Wm. E. Coffin & Co., Boston. ja45

## **MACHINE WORKS OF ROGERS, KETCHUM & GROSVENOR, PATTERSON, N. J.**

The undersigned receive orders for the following articles, manufactured by them of the most superior description in every particular. Their works being extensive and the number of hands employed being large, they are enabled to execute both large and small orders with promptness and despatch.

Railroad Work.

Locomotive steam engines and tenders; Driving and other locomotive wheels, axles, springs & flange tires; car wheels of cast iron, from a variety of patterns, and chills; car wheels of cast iron with wrought tires; axles of best American refined iron; springs; boxes and bolts for cars.

Cotton, Wool and Flax Machinery of all descriptions and of the most improved patterns, style and workmanship.

Mill gearing and Millwright work generally; hydraulic and other presses; press screws; callenders; lathes and tools of all kinds; iron and brass castings of all descriptions.

ROGERS, KETCHUM & GROSVENOR, ja45 Paterson, N. J., or 60 Wall street, N. York.

## **PATENT RAILROAD, SHIP AND BOAT SPIKES.**

The Troy Iron and Nail Factory keeps constantly for sale a very extensive assortment of Wrought Spikes and Nails, from 3 to 40 inches, manufactured by the subscriber's Patent Machinery, which after five years' successful operation, and now almost universal use in the United States (as well as England, where the subscriber obtained a patent) are found superior to any ever offered in market.

Railroad companies may be supplied with Spikes having countersink heads suitable to holes in iron rails, to any amount and on short notice. Almost all the railroads now in progress in the United States are fastened with Spikes made at the above named factory—for which purpose they are found invaluable, as their adhesion is more than double any common spikes made by the hammer.

All orders directed to the Agent, Troy, N. York will be punctually attended to.

HENRY BURDEN, Agent.

Spikes are kept for sale, at Factory Prices, by I. & J. Townsend, Albany, and the principal iron merchants in Albany and Troy; J. I. Brown, 222 Water St., New York; A. M. Jones, Philadelphia; T. Janviers, Baltimore; Degrand & Smith, Boston.

.. Railroad Companies would do well to forward their orders as early as practicable, as the subscriber is desirous of extending the manufacturing so as to keep pace with the daily increasing demand. ja45

## **SPRING STEEL FOR LOCOMOTIVES,**

Tenders and Cars. The Subscriber is engaged in manufacturing Spring Steel from 1 1/2 to 6 inches in width, and of any thickness required: large quantities are yearly furnished for railroad purposes, and wherever used, its quality has been approved of. The establishment being large, can execute orders with great promptitude, at reasonable prices, and the quality warranted. Address

JOAN F. WINSLOW, Agent, Albany Iron and Nail Works,

17

# DAVENPORT & BRIDGES'

## CAR WORKS, CAMBRIDGEPORT, MASS.

Manufacture to Order, Passenger and Freight Cars of every description, and of the most improved pattern; also furnish Snow Ploughs and Chilled Wheels of any pattern and size. Forged Axles, Springs, Boxes and Bolts for Cars at the lowest prices.

All orders punctually executed and forwarded to any part of the country.

Our Works are within fifteen minutes ride from State street, Boston—Omnibuses pass every fifteen minutes. 10/

## THE HERRON RAILWAY TRACK,

As seen stripped of the top ballasting

A GOLD MEDAL AWARDED THE INVENTOR BY THE AMERICAN INSTITUTE.

**THE UNDERSIGNED RESPECTFULLY** invites the attention of Engineers, and Railroad Companies, to some highly important improvements he has recently made in the Herron system of Railway structure. These improvements enable him to effect a very large reduction in the quantity of Timber, and cost of construction, without impairing the strength of the Track, or its powers of resisting frost, while they secure additional features of excellence in the Drainage and facility of making Repairs.

The above cut represents the "Herron Track" as it is laid on the Philadelphia and Reading, and on the Baltimore and Susquehanna Railroads. The intersection of the sills of the trellis are 5 feet from centre to centre, while in the new construction they are only 2½ feet. This renders the string piece unnecessary, thus removing the only objectionable feature found in the Track.

The result of experience has proved that all Tracks constructed with longitudinal timbers, such as mud sills, and more especially, the continuous bearing string pieces retain the rain water that falls between the Rails, which, being thus confined, settles along those timbers, and accumulating in quantity flows rapidly along them on the descending grades, washing out the earth from under the timber, and frequently causing large breaches in the embankments of the road. Whereas all water intercepted by the oblique sills of the trellis, is discharged immediately into the side ditches.

In the 5 foot plan, the Track occupies a Road bed nearly 11 feet wide, while the new construction takes

but 8 feet; the timber being more concentrated under the Rails. A block of hard wood, about 2 feet long and 15 inches wide, is introduced into a square of the trellis for the purpose of giving an additional, and effectual support to the joints of the Rails, which rest upon it. Should these joint blocks become chafed and worn by the working, and imbedding of the chairs, as is now the case on all Railroads, they can be readily replaced without any derangement of the timbers less liable to wear.

The following is a general estimate of its cost near the seaboard. In the interior it will be considerably less.

ESTIMATE OF THE PROBABLE COST OF ONE MILE.		
4,924 Timbers, 11 ft. long, 3 x 6 inches =		
68,696 ft. b.m., at \$10 =		\$686 96
587 Oak joint blocks, 2 ft. x 3 x 15 in. =		
4,403 ft. b.m., at \$13 =		57 24
13,000 Spikes = 2,250 lbs. at 4¢ =		101 25
Workmanship free of patent charge =		600 00

Cost of one mile including the laying of the Rail.....\$1,445 45

He has made other important improvements, which will be shown in properly proportioned models, that give a much better idea of the great strength of the Track than a drawing will do.

Sales of the Patent right to all the distant States will be made on liberal terms.

**JAMES HERRON,**

Civil Engineer and Patentee.

## FRANKLIN HOUSE,

No. 105 Chestnut Street, Philadelphia.

The undersigned takes the liberty of calling the attention of the readers of the Journal to the fact that the Office is removed from New York to the FRANKLIN HOUSE, Philadelphia, where he will be always pleased to meet and greet them. They will not only find a pleasant Reading Room, with lots of foreign periodicals, treating of Railroads and Machinery, but they will always find good-sized and airy rooms—clean beds—and a well supplied table. If they would have further proof of this, they have only to call, and judge for themselves, and much oblige the proprietor, **D. K. MINOR.**

## AMERICAN RAILROAD JOURNAL.

OFFICE AT THE FRANKLIN HOUSE,  
105 Chestnut Street,  
PHILADELPHIA, PA.

This is the only periodical having a general circulation throughout the Union, in which all matters connected with public works can be brought to the notice of all persons in any way interested in these undertakings. Hence it offers peculiar advantages for advertising times of departure, rates of fare and freight, improvements in machinery, materials, as iron, timber, stone, cement, etc. It is also the best medium for advertising contracts, and placing the merits of new undertakings fairly before the public.

TERMS.—Five Dollars a year, in advance.

### MEDFORD BRANCH TRAINS.

Leave Boston at 7½, 9 A.M., 2½, 5-50 P.M. Leave Medford at 6½, 8 A.M., 1½, 5½ P.M.

The Depot in Boston is on Haymarket Square.

Passengers are not allowed to carry Baggage above \$50 in value, and that personal, unless notice is given, and an extra amount paid, at the rate of the price of a Ticket for every \$500 additional value.

31 ly

CHAS. MINOT, Sup't.

## SUMMER ARRANGEMENT.—NEW YORK AND ERIE RAILROAD LINE, from April 1st until further notice, will

run daily (Sundays excepted) between the city of New York and Middletown, Joshen, and intermediate places, as follows:

### FOR PASSENGERS—

Leave New York at 7 A.M. and 4 P.M. " Middletown at 6½ A.M. and 5½ P.M.

FARE REDUCED TO \$1 25 to Middletown—way in proportion. Breakfast, supper and berths can be had on the steamboat.

### FOR FREIGHT—

Leave New York at 5 P.M. " Middletown at 12 M.

The names of the consignee and of the station where to be left, must be distinctly marked upon each article shipped. Freight not received after 5 P. M. in New York.

Apply to J. F. Clarkson, agent, at office corner of Duane and West sts. H. C. SEYMOUR, Sup't. March 25th, 1846.

Stages run daily from Middletown, on the arrival of the afternoon train, to Millford, Carbondale, Honesdale, Montrose, Towanda, Owego, and West; also to Monticello, Windsor, Binghamton, Ithaca, etc., etc. Agent on board. 13 ly

## NORWICH AND WORCESTER RAILROAD.

Summer Arrangement, commencing

Monday, April 6, 1846.

Accommodation Trains, daily, except Sunday. Leave Norwich, at 6 a.m., and 4½ p.m. Leave Worcester, at 10 a.m., and 4½ p.m.

The morning Accommodation Trains from Norwich, and from Worcester, connect with the trains of the Boston, and Worcester and Western railroads each way.

The Evening Accommodation Train from Worcester connects with the 1½ p.m. train from Boston.

New York Train via Long Island Railroad: Leave Allyn's Point for Boston, about 1 p.m., daily, except Sunday.

Leave Worcester for New York, about 10 a.m., stopping at Webster, Danielsonville, and Norwich.

New York Train via Steamboat—Leave Norwich for Boston, every morning, except Monday, on the arrival of the steamboat from New York, stopping at Norwich and Danielsonville.

Leave Worcester for New York, upon the arrival of the train from Boston, at about 4½ p.m., daily, except Sunday, stopping at Webster, Danielsonville and Norwich.

Freight Trains daily each way, except Sunday.—Special contracts will be made for cargoes, or large quantities of freight, on application to the superintendent.

Fares are Less when paid for Tickets than when paid in the Cars. 31 ly J. W. STOWELL, Sup't.

### TROY RAILROADS.—IMPORTANT NOTICE.

Troy and Greenbush Railroad, forming a continuous track from Boston to Buffalo and Saratoga Springs. This road is new, and laid with the heaviest iron H rail. Trains will always be run on this road connecting at Greenbush each way with the trains to and from Boston and intermediate places, leaving Greenbush daily at 11 p.m. and 6 p.m., or on arrival of the trains from Boston; leave Troy at 7 1/2 a.m. and 4 1/2 p.m., or to connect with trains to Boston.

Trains also run hourly on this road between Troy and Albany. Running time between Greenbush and Troy, 15 minutes.

### TROY AND SCHENECTADY RAILROAD.

This road is laid its entire length with the heaviest H rail— which is not the fact with the road from Albany. Trains will always be run on this road connecting each way, to and from Buffalo and intermediate places. Leave Troy for Buffalo at 7 1/2 a.m. and 1 p.m. and 6 1/2 p.m., or to connect with the trains for the west; leave Schenectady at 2 1/2 a.m., 8 1/2 a.m., 1 p.m. and 3 1/2 p.m., or on arrival of the trains from Buffalo and intermediate places.

### TROY AND SARATOGA RAILROAD.

THE ONLY DIRECT ROUTE.

No change of passenger, baggage or other cars on this route. Cars leave Troy for Ballston, Saratoga Springs, Lake George and White Hall at 7 1/2 a.m., (arriving one hour in advance of the train from Albany,) and at 3 1/2 p.m. Returning, leave Saratoga at 9 a.m. and 3 1/2 p.m., (reaching Troy in time for the evening boats to New York.) Cars also leave Troy for the Burrough at 3 1/2 p.m. and 7 p.m., connecting with packet boats for the north. This takes passengers from New York and Boston to Montreal in 44 hours.

N.B. Travellers will find the routes through Troy most convenient and economical, and as expeditious as any other. The steamboats to and from New York land within a few steps of the railroad office, and passengers are taken up and landed by the different railroad lines at the doors of principal hotels, thus saving all necessity for, and annoyance from, hack drivers, cabmen, runners, etc.

Aug. 3, 1846.

1y 32

### BALTIMORE AND OHIO RAILROAD.

MAIN STEM. The Train carrying the Great Western Mail leaves Bal-

timore every morning at 7 1/2 and Cummerbund at 8 o'clock, passing Ellicott's Mills, Frederick, Harpers Ferry, Martinsburgh and Hancock, connecting daily each way with the Washington Trains at the Relay House seven miles from Baltimore, with the Winchester Trains at Harpers Ferry—with the various railroad and steamboat lines between Baltimore and Philadelphia and with the lines of Post Coaches between Cumberland and Wheeling and the fine Steamboats on the Monongahela Slack Water between Brownsville and Pittsburgh. Time of arrival at both Cumberland and Baltimore 5 1/2 P. M. Fare between those points \$7, and 4 cents per mile for less distances. Fare through to Wheeling \$11 and time about 36 hours, to Pittsburgh \$10, and time about 32 hours. Through tickets from Philadelphia to Wheeling \$13, to Pittsburgh \$19. Extra train daily except Sundays from Baltimore to Frederick at 4 P. M., and from Frederick to Baltimore at 8 A. M.

### WASHINGTON BRANCH.

Daily trains at 9 A. M. and 5 P. M. and 12 at night from Baltimore and at 6 A. M. and 5 1/2 P. M. from Washington, connecting daily with the lines North, South and West, at Baltimore, Washington and the Relay house. Fare \$1.60 through between Baltimore and Washington, in either direction, 4 cents per mile for intermediate distances. 13y1

### MANUFACTURE OF PATENT WIRE

Rope and Cables for Inclined Planes, Standing Ship Rigging, Mines, Cranes, Tillers etc., by JOHN A. ROEBLING, Civil Engineer, Pittsburgh, Pa.

These Ropes are in successful operation on the planes of the Portage Railroad in Pennsylvania, on the Public Ships, on Ferries and in Mines. The first rope put upon Plane No. 3, Portage Railroad, has now run 4 seasons, and is still in good condition. 2y191y

### NEW RAILROAD ROUTE FROM BUFFALO TO CINCINNATI.

Passengers destined for Columbus and Cincinnati, Louisville, Ky., St. Louis, Mo., Memphis, Tenn., Vicksburg, Natchez, New Orleans, and all intermediate ports, will find a new, and the most expeditious and comfortable Route, by taking Steamboats at Buffalo, landing at Sandusky City, Ohio, distance.....230 miles.

From thence by Cars, over the Mansfield Railroad which is new and just opened [laid with heavy iron,] to Mansfield, distance.....56 " Thence by Stage via Columbus to Xenia over gravel and Macadamized Road, (the best in the state,) in new coaches, distance.....88 " Thence, over the Little Miami Railroad, from Xenia to Cincinnati, distance.....65 "

### TIME.

From Buffalo to Sandusky.....24 hours. Leave Sandusky 5 a.m. to Columbus.....14 " From Columbus to Cincinnati.....15 "

Or say 30 hours from Sandusky to Cincinnati over this route, including delays.

### FARE.

From Buffalo to Sandusky, Cabin.....\$6 00 " " " " Steerage.....3 00 " Sandusky to Columbus.....4 50 " " through to Cincinnati.....8 00

Passengers should not omit to pay their fare through from Sandusky City to Cincinnati and take receipts availing themselves of the benefit of a contract existing between the said Railroad and Stage Co's, securing 121 miles travel by good Railroad and 88 miles by Stage, in crossing from Lake Erie to the Ohio river, in the space of 30 hours.

Passengers destined for St. Louis, or any point below on the Mississippi, will save by taking this route, from 4 to 6 days time and travel, and nearly half the expense, over the Chicago and Peoria route to the above places.

Fare by this route, although the cheapest, will in a short time be reduced, Railroad lengthened, and speed increased.

B. HIGGINSON, Sup't, etc.  
M. & S. C. R. R. Co.

Sandusky City, Ohio.

### NEW YORK & HARLEM RAILROAD CO.—Winter Arrangement.

On and after Monday, November 23, 1846, the cars will run as follows:

Leave 27th street for 42d street, Deaf and Dumb Institute, Yorkville, Harlem Morrisiana, and Williams' Bridge, at 7 o'clock a.m. From City Hall for above named places, 2 p.m. [freight train.] 2 30 p.m. 5 p.m. to Morrisiana only.

Leave City Hall for Harlem, Morrisiana, Fordham and Williams' Bridge, at 7 45 a.m., and 10 45 a.m.; 1 15 p.m., 2 p.m. [freight train.] 2 30 p.m. and 3 45 p.m.

Leave City Hall for Hunt's Bridge, Bronx, Tuckahoe, Hart's Corners White Plains, Davis' Brook, Unionville and Pleasantville, [Pleasantville 4 miles from Sing Sing.] 7 45 and 10 45 a.m.; 1 15 p.m., 2 p.m. [freight train,] and 3 45 p.m.

### RETURNING.

Leave Pleasantville, at 8, 10, [freight train,] and 11 a.m.; 1 30, and 4 p.m.

Leave White Plains, at 8 12, 10 30, [freight train] and 11 20 a.m.; 1 50, and 4 20 p.m.

Leave Tuckahoe, 8 35, 10 55, [freight train,] and 11 35 a.m.; 2 05, and 4 35 p.m.

Leave Williams' Bridge at 7 45, 8 50 and 11 50 a.m.; 2 10, 4, and 4 50 p.m.

Leave Morrisiana 8 and 9 05 a.m.; 12 05, 2 35, 4 20, 5 05 and 6 p.m.

Leave Yorkville, at 8 12 a.m.; 4 35 and 6 15 p.m.

### SUNDAY ARRANGEMENTS.

Leave City Hall for Pleasantville and intermediate places, at 7 45 a.m.; 1 15 and 3 p.m.

Leave Pleasantville for City Hall, at 8 a.m.; 11, and 3 15 p.m.

Leave City Hall for Williams' Bridge and intermediate places, 10 45 a.m.; 2 30 p.m.

Leave Williams' Bridge for City Hall, at 8 50 and 11 50 a.m.; 1, 3 45 and 4 05 p.m. 1y49

On molasses and oil.....\$6 00 per hhd.

Goods addressed to F. WINTER, Agent, forwarded free of commission. THOMAS PURSE, y40 Gen'l. Sup't. Transportation.

### THE BEST RAILROAD ROUTE TO THE Lake and Buffalo, from Cincinnati.

Take Cars to Xenia, 65 miles; take Stage to Mans-

field, 88 miles; thence by Cars to Sandusky, 56 miles to the Lake; thence Steamboat to Buffalo, 230 miles.

Fare from Cincinnati to Sandusky.....\$8 00 " " Sandusky to Buffalo, Cabin.....6 00 " " " " Steerage.....4 50

Fare by this route, although the cheapest across the state, will be reduced in a short time, railroad lengthened, and speed increased.

Leave Cincinnati in the morning, arrive at Columbus at night.

Leave Columbus in the morning, arrive at Sandusky same day.

Leave Sandusky, by Boat, in the morning, arrive at Buffalo next morning in time for the Cars north and east for Niagara Falls, Canada, Saratoga Springs, Troy, Albany, Boston, New York, Washington, or Philadelphia.

Passengers should not omit to pay their fare through from Cincinnati to Sandusky, or from Columbus to Sandusky via Mansfield; as this route is the only one that secures 56 miles [this road is run over in 2h. 50m.,] most railroad which is new, and is the shortest, cheapest and most expeditious across the state.

Fares on the New York railroads are about to be reduced.

B. HIGGINS, Sup't, etc.  
Sandusky, Ohio. M. & S. C. R. R. Co.

### THE SUBSCRIBER IS PREPARED TO

execute at the Trenton Iron Works, orders for Railroad Iron of any required pattern, and warranted equal in every respect in point of quality to the best American or imported Rails. Also on hand and made to order, Bar Iron, Braziers' and Wire Rods, etc., etc.

Manufactured and for sale by

**MORRIS, TASKER & MORRIS.**  
Warehouse S. E. Corner of Third & Walnut Streets, PHILADELPHIA.

**T**O LOCOMOTIVE AND MARINE ENGINE BOILER BUILDERS. Pascal Iron Works, Philadelphia. Welded Wrought Iron Flues, suitable for Locomotives, Marine and other Steam Engine Boilers, from 2 to 5 inches in diameter. Also, Pipes for Gas, Steam and other purposes; extra strong Tube for Hydraulic Presses; Hollow Pistons for Pumps of Steam Engines, etc. Manufactured and for sale by

**MORRIS TASKER & MORRIS,**  
Warehouse S. E. corner 3d and Walnut Sts., Philadelphia. 11f

**P**ATENT INDESTRUCTIBLE WATER

Pipes. The subscribers continue to manufacture the above Pipes, of all the sizes and strength required for City or Country use, and would invite individuals or companies to examine its merits.—This pipe, unlike cast iron and lead, imparts neither color, oxide or taste, being formed of strongly riveted sheet iron, and evenly lined on the inside with hydraulic cement. While in the process of laying, it has a thick covering externally of the same—thus forming nature's own conduit of stone. The iron being thoroughly enclosed on both sides with cement, precludes the possibility of rust or decay, and renders the pipe truly indestructible. The prices are less than those of iron or lead. We also manufacture Basins and D. Traps, for Water Closets, on a new principle, which we wish the public to examine at 112 Fulton street, New York.

J. BALL & CO.

**New York and Erie Railroad.**

Report of the Commissioners.

(Continued from page 184.)

Collecting the data that have been presented—we now proceed to give the expense of extra power, and make a comparison of the several routes, on the basis that has been submitted.

**NINEVEH, OR INTERIOR ROUTE.**

The extra power to carry a train due to an ascending grade of 20 feet per mile, up a grade of 65 feet per mile, (the ruling grade on this route,) is 1386, or nearly 1 4-10 engines. We have then,

$40 \times 2 \times 1386 \times 15 = 16632$  cents per mile run with a load of 185 tons;  $16632 \div 185 = 0.9$  cents per ton per mile.

This route is 4.29 miles longer than the Susquehanna or Southern route. For this distance, the whole cost of transportation, exclusive of depot expenses, is chargeable to the Interior route. This, on a ruling grade of 20 feet per mile, ascending in the direction of the greatest trade, is estimated at one cent per ton per mile on the freight carried in both directions. The freight going westward is estimated at one-third of that going eastward, and hence a charge of 1 1-3 cents per ton per mile on that moving eastward, will cover the cost on freight in both directions.

The extra expense all computed on freight going eastward, will be per ton as follows:

On 35 6 10 miles, (length that heavy grade rules) at the rate of 0.9 cents	32.04
On 4.29 miles, extra length of line, and to cover freight in both directions, though only chargeable on that moving east, at the rate 1 1/3 cts.	5.72
Per ton of freight,	37.76

**SUSQUEHANNA, OR RIVER ROUTE.**

The extra power to carry a train due to an ascending grade of 29 feet per mile, up a grade of 68 feet per mile, (the ruling grade on this route) is 1491, nearly 1 1/2 engines: computed on the basis above adopted, is

$40 \times 2 \times 1491 \times 15 = 17892$  cents per mile, run with a load of 185 tons:  $17892 \div 185 = 0.97$  cents per ton per mile.

The length on which ruling grade prevails is 15.66 miles, at 0.97 cents per mile, = 15.19 cents.

**Comparison of the two routes:**

Nineveh route,	37.76
Susquehanna route,	15.19

Difference in favor of Susquehanna route, 22.57

**SULLIVAN COUNTY, OR INTERIOR ROUTE.**

It has been shown that the train will proceed from Deposit to the mouth of Callicoon creek, with a load due to a level, or a grade descending 15 feet per mile; the load being restricted by the return load to 358 tons freight. The extra power required to carry this load up a grade of 45 feet per mile, is 534, or 2 1/2 engines of equal power. We have then,

$40 \times 2 \times 534 \times 15 = 2808$  cents per mile run with a load of 358 tons,  $2808 \div 358 = 0.78$  cents per ton per mile.

The distance on which this grade rules, as before remarked, between the mouth of the

Callicoon and Wurtsboro, is 52.58 miles; but as it is to be compared with the Delaware river line from the mouth of the Callicoon to Port Jervis, it should be taken for extra power, for no greater distance than that between the two latter points, or 48.97 miles. The extra power will therefore be taken for this distance.

The route is 2.61 miles longer than the Delaware river route. The extra length will be estimated the same as that for extra length of the Nineveh route, viz: at one cent per ton per mile on freight each way; or, charging wholly on freight moving eastward 1 1/2 cents per ton per mile.

Summary of extra cost of transportation on Sullivan county route, charging the whole cost on freight moving east.

48.97 miles, at 0.87 cents per ton per mile, =	38.19
2.61 miles extra length, at 1 1/2 cents,	3.48
Total extra cost per ton, over the Delaware river route,	41.67
Extra cost on Nineveh route, as before shown,	22.57

Total extra cost on the interior routes, 64.24

Having determined the extra cost of transportation per ton, caused by the heavy grades and extra lengths, it becomes necessary to ascertain what will be the total tonnage annually transported over the road. The calculations are all based on changing the whole expense of extra power on freight moving eastward; that moving westward being provided for by the method adopted to determine the question. It is therefore the tonnage moving eastward that we want to ascertain the amount of.

The officers of the New York and Erie railroad company, in presenting their views of this question to the commissioners, assumed that 500,000 tons per annum would be transported eastward over the railroad. This position was not controverted by any person interested in the Northern or other routes.

It is not possible to arrive at accuracy on this point; and the commissioners are not willing to say the road will not eventually reach this estimate; but this would be a very large business for a general trade, and much beyond the capacity of a single track road. The question to be determined is, what amount of trade will pass over the section between the Shawangunk ridge and Port Crane, in Broome county.

An estimate of this kind should look to some future period, when the business of the road might reach, not its full capacity, but such as would form an average with the past and the future.

The Baltimore and Ohio road, as now, and for several years past, has been worked about 180 miles. For the year ending September 30th, 1846, there was transported on it, to and from the different points, 193,916 tons, (including the trade in both directions,) equivalent to about 84,000 tons carried over the whole road.

The New York and Erie railroad, when completed, will extend about 260 miles be-

yond Port Crane in Broome county. Now if we suppose three tons carried to Baltimore, to one ton in the opposite direction, there must have been about 145,000 tons moved towards Baltimore. This proportion applied to the New York and Erie railroad, for equal distances, would show about 210,000 tons arriving at the western end of the routes under consideration. Whether these two roads should be regarded as presenting a fair parallel for amount of trade is, however, a question which may admit of a difference of opinion.

The tonnage on the Western railroad, from Albany to Worcester, 156 miles, for the year 1845, was equal to 93,392 tons carried over the whole road. This includes freight in both directions. On this road the freights in opposite directions are more nearly equal than is usual. Judging from the amount received for freight, it appears to be not far from two to one. This would show a result about 13 per cent. greater for the tonnage towards tide water, comparing the distances, than the Baltimore and Ohio railroad. It is to be considered, however, that a considerable portion of this tonnage is from place to place, and forms no part of the through tonnage.

The route traversed by the New York and Erie railroad, is understood to be in general a grazing district, that furnishes freight of greater value but of less tonnage than a grain growing district.

The commissioners have been much embarrassed in forming a satisfactory estimate on the amount of tonnage. It does not appear practicable, from any data in their possession, to reach any definite accuracy, and their estimate must be considered as in a great measure conjectural.

The amount assumed by the engineer of the company is regarded as too high, to form the basis of comparison between the several routes. The commissioners have assumed 200,000 tons as the annual amount of freight that may be expected to move eastward over that portion of the road embraced in this question of location; this they think as high an estimate, as they are warranted to make for this comparison.

It has been shown, the cost of transportation will be 64.24 cents per ton, (computed wholly on freight moving eastward,) greater on the interior routes than on the river routes.

This rate on 200,000 tons per annum is, 200,000 tons, at 64.24 cts. per ton = \$128,480.

The passenger trade will feel the unfavorable influence of the heavy grades, and will require extra power, or the train must proceed over them at reduced velocity.

The excess of curvature on the Nineveh, and the Sullivan, or interior routes, over that on the river routes is 3903, degrees, or equal to 10.84 [nearly eleven] entire circles. The excess of curvature is mostly on radii of less than 1000 feet, and frequently occurs on the heavy grades. It will no doubt increase the expense of power. The commissioners are not aware of any definite data, by which this question can be reduced to computation.—Heavy curving on railroads is regarded to be

the next unfavorable thing to heavy grades; and great expenses are often incurred to reduce the curves to large radii, or dispense with them altogether.

Not only is more power required to move the train; but the displacement and wear of rails; and the wear of cars and engines is much greater on sharp curves than on a straight line. On the Nineveh and Susquehanna lines, an allowance of 10 feet per mile, or 15 per cent. was made for the curve lines: whether this is sufficient for the extra power is doubtful. On the Sullivan county lines no such allowance was made. If it had been, it would have increased the maximum grade in the same proportion. If the same rule be applied to this, it will raise the total cost of extra power to nearly 70 cents per ton.

Regarding the extra wear of rails, cars and engines, this great excess of curvature, though not susceptible of a definite reduction, must be considered as a very serious objection to the interior lines, when viewed only in connection with the freight business. Its influence on the passenger trade, exposing the cars to leave the track, causing greater wear to the road and machinery, and restricting the speed of travelling is still more serious.

The interior routes will be more obstructed by heavy snows, (especially that in Sullivan county) than the river routes, which will increase the expense of running, and cause delays that will be prejudicial to the business of the road during the winter season.

Heavy grades cause extra wear on the rails, cars and engines, from the more frequent and severe application of the friction brake to control the latter in their descent. The cars on the heavy grades would not stand still, without being secured, and consequently any accident by which a car should get loose would allow it to move off with great velocity, putting at hazard its own safety, and that of others that might be in its way. Any circumstance that should disable an engine in ascending a heavy grade, such as the slipping of the wheels, or the machinery suddenly getting out of order, would put the whole train at hazard.

On a long line, where the passenger traffic will be important, the excess of heavy grades and curvature on the interior routes, will have a material influence on the economy and usefulness of the road.

The several points of disadvantage that appertain to the interior routes, as above considered, viz: the influence of the great excess of curvature on the freight traffic, together with that of the heavy grades on the passenger traffic, the greater exposure to heavy and drifting snows, extra wear of rails, cars and engines on the excess of heavy grades and curvature, with the greater hazard of accident and consequent damage—are of a character that does not admit of any definite

reputation. They are, however, of such importance, that heavy expense, where a change of route is practicable, may well be incurred to avoid them. That they materially impair the value of a railroad is beyond question. After careful consideration, the commissioners have come to the conclusion,

that collectively, they will not be less than half the amount before stated, as the excess on the freight traffic caused by the excess of heavy grades.

The total amount of excess chargeable, as before presented, to the interior routes, is: on Freight, arising from heavy grades, \$128,480  
Items above enumerated, collectively assumed at 50 per cent. of the above,

64,240

192,720

From this there must be deducted:

1st. The extra cost of constructing and maintaining the southern line.

2d. The annual tax imposed by the State of Pennsylvania.

In relation to the first, the estimates of the engineers show the extra cost to be \$19,821. To this must be added the interest that will accrue on the expenditure until the road is in operation, and receiving income from its business. This will, of course, depend on the vigor with which the work is prosecuted, and the facility with which its traffic may be advantageously commenced. It is supposed 10 per cent. on the whole sum, would provide for all the accruing interest, making the capital invested for this item, \$571,803. The river routes, more particularly that along the Delaware, from the heavy bridges that must be maintained, and from the exposure of the work to the floods of this river, will be more expensive to keep in repair than the interior routes. This item is estimated at \$15,000 per annum.

The second item, the tax imposed by the State of Pennsylvania, is chargeable when the whole road is completed to Dunkirk, or connected with some road leading to Lake Erie.

This annual bonus will not, therefore, be chargeable until the road is in full operation.

The annual charge will be as follows:

Interest on \$571,803, at 6 per cent., \$34,308

Annual repairs, excess, 15,000

Bonus to Pennsylvania, 10,000

\$59,308

Summary of excess:

On the interior routes, \$192,720

On the river routes, 59,308

\$252,028

Showing that the annual expenses on the interior routes will be \$252,028, greater than those on the river routes. This result has been reached, after carefully considering and yielding every advantage to the interior routes which can be regarded as belonging to them. The mode of working on which the calculation is based, is the most favorable to them, involving the most careful attention to the economy of motive power; and the commissioners feel constrained to say, that they have serious doubts whether a more expensive arrangement in relation to motive power would not, on account of greater simplicity, be found more expedient in practice.

Herewith are submitted a map and profile marked A, of the Nineveh and Susquehanna

lines; a map and profile marked B, of the Sullivan county and Delaware river line; a profile marked C, of the several routes from Binghamton to the Shawangunk summit; and a profile marked D, of the whole line of the New York and Erie railroad, from Piermont to Dunkirk. These have all been prepared under the directions of the commissioners, and from surveys, also under their directions, except the general profile, which is from such surveys only on those portions that have come under the examinations of the commissioners. From these maps and profiles a good idea of the general features of the several routes may be obtained.\*

Tabular statements of the results of the surveys by Henry Tracy and Jas. O. Morse, Esqrs., the engineers employed by the commissioners, are also herewith submitted.

The commissioners are required to take into consideration "the terms, conditions," etc., of the Act of Pennsylvania, authorizing the New York and Erie railroad company to construct a portion of their road in that State.

There are several conditions in the Act of the Legislature of Pennsylvania that are peculiar, and require the notice of the commissioners.

*First.* The railroad, if constructed along the Delaware river, is required to "be so constructed as not to obstruct the rafting navigation, nor contract the natural flow (and expansion) of the Delaware river (at high floods) nor injure the works," etc., of the Delaware and Hudson canal company; and in relation to the point of crossing the Delaware river. Similar provisions are contained in the act of this State, which constitute this commission.

On all these points, the engineer employed by the commissioners was instructed to conduct his surveys and make his estimates with a view to a full compliance with these provisions.

*Second.* The third section of the Act of Pennsylvania requires certain laws to be passed by the Legislature of this State; it also requires from the New York and Erie railroad company, conditions in relation to the conduct of their business, which have been considered matters for said company to look to before they could legally locate their road in that State; but not requiring the attention of this commission.

*Third.* The 5th section of said Act requires that after the said railroad is completed to Dunkirk, or connects at its western termination, with any improvement extending to Lake Erie, said company shall pay to the State of Pennsylvania \$10,000 per annum. This is presumed to be the main condition to which the attention of the Commissioners was called, and they have placed it, as an annual charge against the routes in that State. It is certainly an onerous and extraordinary burden to be imposed on a company, for the privilege of constructing a work, that in its results, must be a great benefit to a large portion of the citizens of that State; but it is a condition, and the Commissioners can do

\* We only give the profile of the several routes, from the Shawangunk to Binghamton.

no less than place it to the debit of those routes.

By the Act of May, 1846, the Commissioners are directed to take into consideration "a comparison of the grades or elevations, and depressions and curvatures, in the line or track of said railroad, in the other counties east and west of Sullivan county."

The Commissioners have no means of judging of the curvatures east and west of Sullivan county, except on the routes surveyed under their directions, which no curvatures so unfavorable in degree, nor much exceeding half the amount, as compared with equal distances.

There are grades both east and west more unfavorable than occur in Sullivan county; and it was contended by the friends of the interior route in that county, that this was sufficient, under the act, to settle the location on that route. Now, (as stated in the preliminary remarks of this report,) it was a matter of public notoriety, before the Act was passed, that grades equally heavy as those in Sullivan county existed both east and west of it; but as this question has been discussed and the views of the Commissioners given, in the preliminary part of this report, it is not deemed necessary to enter into further detail here on this point.

If the heavy grades in this county were so situated, in relation to the heavy grades east and west of it, that no material benefit could be obtained by avoiding them, then the construction of the Act above given by the friends of the Sullivan county route, would no doubt be in accordance with the intention of the Legislature. But inasmuch as they are so situated, that heavy extra expense would be incurred in conducting the traffic of the road over them, such construction would be equivalent to the position, that, serious obstacles on one part of the line were sufficient reason that others of the same kind constitute no impediment to the enterprise, which position is considered as inadmissible, in view of the general object of the Act. It is well known that the heavy grades which occur on several parts of the route of the New York and Erie railroad, have been great impediments to the progress of that enterprise; and consequently its friends have endeavored to reduce such obstacles as much as possible. The application for the law, establishing this commission, had its origin in this effort; and the original law, (of which the present is an amendment,) had a reference to the same object, namely: to remove some of the impediments, (of this character,) to the progress of the improvement. The Commissioners are therefore fully of the opinion, that the construction they have given to the Act, is the proper one, namely: that "this fact is to be candidly considered, and to have its due influence on their decision, but cannot control irrespective of all other facts that bear on the question;" and especially, cannot do away with the main object of the Act, which was, to determine whether those grades could be adopted "without great prejudice to the public interest."

The Commissioners are further required

to take into consideration, "the several acts of the Legislature of this State in granting aid to the said company, and especially the provisions of the Act, mentioned in the first Section of this Act."

The Act incorporating the New York and Erie railroad company was passed in 1832. It authorized the construction of a railroad through the southern tier of counties, and forbids any connection with railroads in the States of Pennsylvania and New Jersey, without the consent of the Legislature of this State. Stock, sufficient to organize the company not being obtained, a subsequent Act was passed, authorizing an organization, when one million of dollars was subscribed to the stock. No progress having been made in 1834, the Legislature authorized a survey of the route for said railroad at the expense of the State. In 1835, an Act was passed authorizing the company to construct and put in operation such sections of the road as they might deem eligible.

The powers and privileges granted by the several Acts of the Legislature, and the prospects of remuneration from the business of the road having failed to command private capital sufficient for the work, "an Act to expedite the construction of a railroad from New York to Lake Erie," was passed in 1836. This Act authorized a loan of the State credit for three millions of dollars, to be advanced in several sums, on the completion of certain sections of the said railroad.

This Act did not secure much progress in the construction of the road. Private capital could not be obtained sufficient to complete the "first section" of road necessary to obtain any portion of the loan of the State credit.

In 1838, the Legislature passed an Act to amend the Act of 1836, above mentioned. This act authorized the loan of the State credit to be made, in equal sums with, and after the expenditure of, private subscription; to commence after the company should expend three hundred thousand dollars.

In 1840, an Act was passed to amend previous acts; authorizing a six per cent. State stock to be loaned to the company, and the stock to be issued, on the expenditure, by the company, from their own means, of half the amount of the same.

Under this act the company proceeded with the work until the loan on the credit of the State was issued, to the amount of three millions of dollars, as authorized by the several acts above mentioned. Failing to command the requisite means to carry forward the enterprise from subscriptions to the stock of the company, after the State loan was exhausted, they were unable to proceed with the work, and early in 1842, notified the State authorities, that they were unable to pay the interest on the State loan. The circumstance authorized the comptroller of the State, to sell the road and its appurtenances after six months notice. The sale was postponed by the authority of the Legislature. At this time, the company were practically insolvent, and had no more than a nominal existence. But the Legislature did not seem disposed to abandon the project, and in 1843,

passed a law authorizing the said railroad company, to issue bonds to the amount of three millions of dollars, and giving these bonds priority to the State lien. Also providing, that the State may take the road on certain conditions, when finished; and if the State should not elect to take the road on such conditions, then, the said company to be released from all liability for the payment of the State stock heretofore issued to them, and amounting to three millions of dollars. After the passage of this law, a new Board of Directors were elected composed of highly intelligent, honorable, and influential citizens, who made vigorous efforts, to raise funds necessary to carry forward and complete the enterprise. Capitalists, however, did not feel sufficient confidence in the success and productiveness of the enterprise, to furnish the necessary funds; and the board who had taken the direction, finding they were not sustained in their efforts, yielded the administration of the affairs of the company to others. Nothing, however, in the way of progress was accomplished, and the work remained stationary until 1845. At that time, it became obvious, that no further progress could be made by private enterprise, unless inducements could be presented that would secure a large addition of subscriptions to the stock of the company, under which a new organization could be effected, and a new impulse given to the project. This was the condition of the enterprise, when the act of 1845 was passed—the act we are called upon particularly to consider.

This act passed May 14th, 1845, provided that a new subscription to the stock of the company should be obtained to the amount of three millions of dollars, and under certain restrictions, bonds were authorized for a like amount. It provides for a release of the lien of the State on account of the loan of its credit for three millions of dollars, provided, a single track road be completed within six years from the passage of the act. It established a commission of three persons, who were authorized to survey and examine the routes between the summit of the Shawangunk and Deposit, and decide whether a practicable route did exist; and one that could be adopted "without great prejudice to the public interest;" but did not authorize any location out of the State as a substitute for that through Sullivan county.

The same commission was authorized to examine the routes between Deposit and a point one mile westerly of Binghamton, with power under certain circumstances, to locate on the route by the great bend of the Susquehanna, passing so far in the State of Pennsylvania as might be necessary for that route.

At the time this act was passed, an act had been passed by the State of Pennsylvania, authorizing the said company to construct a portion of their road in that State, so far as necessary to occupy the route by the Great Bend of the Susquehanna; but they had not authorized the company to occupy any portion of that State in the valley of the Delaware river.

To induce the subscription of three millions, and thereby secure the completion of the railroad, the Legislature of 1845, by the act above-mentioned, prospectively gave up the lien of the State for the three million loan on the conditions above mentioned: they authorized under certain restrictions the railroad to pass through a portion of Pennsylvania, and thereby secure a more favorable line; also to consolidate the old stock.

Under this act the company and its friends undertook to revive the affairs of the enterprise. The first proceeding was to obtain the subscription of three millions of dollars, to the stock of the company: without this, nothing could be done. The steps taken to procure it, showed that many persons were more ready to advocate the project, than to furnish funds to carry it forward; and (notwithstanding the State prospectively released its lien on the road—the old stockholders submitting to a loss of half their stock—having the prospect of being allowed an improved route for an unfavorable portion of the line,) they did not succeed in accomplishing this preliminary step, without great efforts, continued for months together; and their final success may be attributed far more to the general influence the road was expected to produce on the trade of New York, than to the dividends that would be made from its earnings.

The Commissioners can regard the law of 1845, in no other light, than as emanating from a desire on the part of the Legislature to offer such inducements to private capital, as would be sufficient to secure the early accomplishment of this great improvement, and thereby afford to a large district of the State, now very much secluded, the means of easy communication to and from our great commercial centre. Subsequent events have proved that, the inducements offered were barely sufficient to obtain the requisite subscription, upon which the new organization has been established. To show the slender hold the new subscription had on the stockholders, it is only necessary to mention that, before and at the time the decision of the Commissioners was made on the question of location, shares of stock, on which \$20 had been paid, could be purchased in the market for two dollars. In this state of the affairs of the company, they were not in a condition to encounter difficulties, which they regarded as onerous and unnecessary, and from which they had indulged the hope of being relieved. The commissioners cannot say the work would have been abandoned if their decision had confined the line to this State; but under the circumstances that existed, they were of opinion, that such a decision would have put in jeopardy the progress of the enterprise.

It was clearly the intention of the Legislature to confine the route to this State, unless it should be found there were urgent considerations for carrying some portion of it thro' Pennsylvania, and the Commissioners were without exception extremely desirous of confining the location to this State. It was an unpleasant duty to carry the line into another State, that demanded compensation for the

benefits that would be conferred on her citizens, while a portion of our own, that had contributed their exertions to secure its benefits, were thus deprived wholly, or in part, of the anticipated advantages. The law, however, under which this commission was established, contemplated the contingency of such decision. It was doubtless framed in view of the necessity that might be found to exist, to abridge the benefits to a comparatively small number, in order to make it more beneficial to the public, and to secure the accomplishment of a great work, that would confer its benefits on a large portion of the population of this State.

To illustrate the views of the Commissioners as to the influence the extra cost of conducting the traffic, will have on the prosperity of the project, they remark:—

*First.*—It cannot be expected that an enterprise of this magnitude will be undertaken by private capital, without a fair prospect of reasonable remuneration for the outlay required.

*Second.*—If the road be constructed in such a manner as to involve large expenses in conducting a given traffic, such expenses must be charged to those interested in the traffic; and consequently the value of the improvement to the community, who use it, depends on the economy with which its business may be conducted.

*Third.*—Whatever tends to increase the cost of conducting the traffic of a road, reduces its power of competing with other roads, or other modes of conveyance, and consequently diminishes its prospect of business, and the inducements to prosecute the enterprise.

*Fourth.*—The facts and computations before presented, show that the interior routes would involve annually, a heavy extra expense; materially affecting the prospects of the enterprise, and consequently hazarding its success.

The legislation of this State, is a full demonstration of the difficulty that has attended every effort to obtain from private sources, the funds necessary to carry forward this work, and the necessity of relieving it from every natural impediment, in order to accomplish the main object for which it has been undertaken. And although in the origin of the enterprise the Legislature was disposed to confine the line strictly to this State; in the progress of the undertaking, subsequent Legislatures have found it expedient, in order to secure to a large portion of the State its benefits, to recognize the possible necessity of some departure from the original design; and hence the establishment of this commission to ascertain the facts, and make such decision as the exigencies of the case should require.

That the river routes, when contrasted with the interior routes, have the decided advantage, cannot admit of a doubt; and with that fact established, the only remaining question which presented itself, was, whether the Commissioners were authorized by the Act to sanction those routes.

The Commissioners were required to adopt the interior routes, provided it can be done

"without great prejudice to the public interest," etc. In arriving at this conclusion, they are required to consider:

*First.*—"The public interest of this State." The public interest is doubtless promoted by the adoption of the route that will be most likely to secure the early construction of the railroad, and render the improvement most beneficial when completed. From the considerations and comparisons presented in the preceding pages, the Commissioners believe the interior routes, if adopted, would be greatly prejudicial "to the public interest of this State."

*Second.*—"The interest of the citizens of this State, who in their (the Commissioners') judgment will be effected by the construction and location of said railroad, collectively considered." In examining this branch of the question, the Commissioners do not propose to notice remote interests.

There is no doubt a considerable number of citizens of this State that will be affected by the road, beyond the limits that are considered as specifically demanding consideration; but, as these will have about the same relative bearing on the question, with those more directly interested; it is not considered necessary to refer more particularly to them.

It can hardly be said that any portion of the citizens of the southern tier of counties, will be injured by the construction of the railroad on either route. Some portion will be less benefited by the adoption of one route, than by the adoption of the other; and comparatively a very small number on either route may not be benefited at all, except the road be constructed on the particular route in which they may be interested. The latter can only be those, who are so situated, that they would only use the road in the event of its being constructed on the route nearest to them. The great mass of the citizens in the southern tier of counties, must be benefited by the construction of the road on either of the proposed routes, and consequently are interested in such measures as will secure its early completion.

The total number of citizens residing on the routes affected by the question of location, or so near, that their trade after the construction of the railroad, would seek it as their avenue to market, is estimated by the census of 1845, at 294,599. Of this number 45,592 will be less benefited by the adoption of the river routes, than by the adoption of the interior routes: and 249,007 will be more benefited by the adoption of the river routes, than by the adoption of the interior routes; or, the ratio is nearly as 16 is to 84. Of those who will be less benefited by the adoption of the river routes, about 72 per cent. will have the benefit of the river route on the Delaware, which will be common to them with citizens west of Binghamton, and will materially lessen their diminution of benefits. The amount of diminution of benefits, compared with equal population, appears on the average, to be about the same whichever route be adopted.

There is another portion of the citizens of this State who are directly interested in this

# Profile of the New York & Erie Rail-Road.

(From the Shawangunk Ridge to Binghamton.)

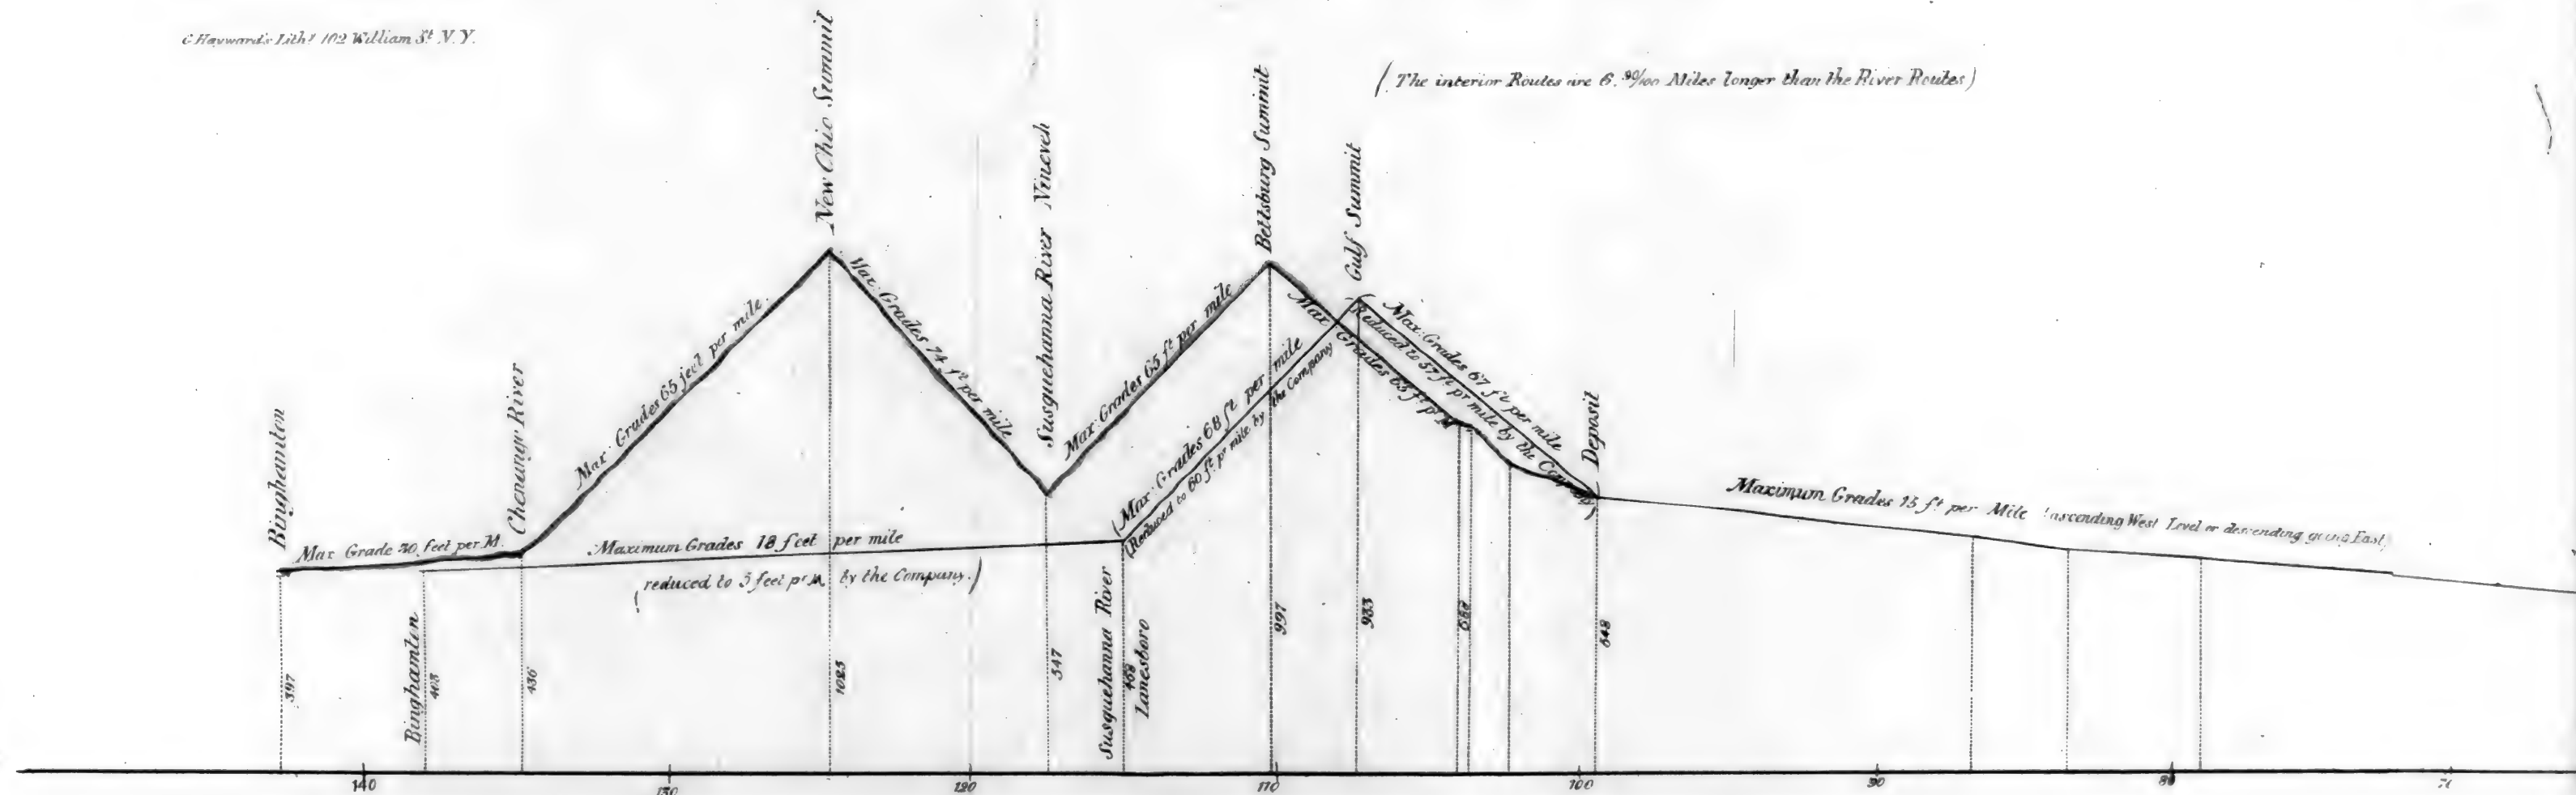

NOTE. This is a true Copy of the Profile accompanying the Commissioners Report; — with additional remarks which are enclosed in brackets.

(C)

question of location, namely: those resident in the city of New York.

This city has an interest in enlarging and securing the trade of the district that will be affected by the construction of the railroad; and it looks not only to that portion in this State, but also to that which will come from the northern part of Pennsylvania (numbering about 100,000 people by the census of 1840) and from Lake Erie. The citizens of New York city, cannot be overlooked in considering this question; they are a portion of this State, and have an equal right to be considered under the Act, so far as their interests are involved: they are chargeable in all cases of State tax, in which they contribute about one-third of the total amount collected by the State. That their interest is peculiarly important in this enterprise, is manifest from the fact, that almost the entire reliance, so far as individual means are required, must depend on them. Whatever risk of private capital the undertaking involves, it must fall on them. The road may be a great benefit to the district through which it may be constructed, and yet afford a very inadequate return to the private capital invested in its construction. A due regard to this interest is not only important and proper in itself, but also as affecting the entire success of the project; as may be inferred from remarks in a preceding part of this report. The interest of the city of N. York, whether regard be had to the benefit its trade will derive from the operation of the road, or the remuneration the traffic will afford for the capital invested in its construction, will be best promoted by the adoption of those routes, that will secure the best and most expeditious means of communication.—This city therefore will be most benefited by the adoption of the river routes.

The adoption of the river routes greatly improves the general prospects of the railroad; and presents very fair prospects for its early completion. The adoption of the interior routes would materially diminish its usefulness and value, if constructed; and moreover, by the discouragement it would throw on the stockholders would hazard the success of the enterprise. The latter remark cannot be regarded as unimportant, when it is considered, that the new stock of the company, can now be purchased in the market at 20 per cent. discount, though only 25 per cent. has yet been paid in.

In view of the facts that have been presented, and the reasoning based on those facts, after careful deliberation, in full board, a majority of the Commissioners decided, that the interior routes, through Sullivan and Broome counties, could not be adopted for that portion of the said railroad, "without great prejudice to the public interest of this State, and the interests of the citizens of this State, who in their judgment will be affected by the construction and location of said railroad, collectively considered." And in accordance with the requirements of the act, they have filed such decision in the office of the Secretary of this State.

John B. Jarvis, Horatio Allen, Jared Wilson, William Doweay.

Correspondents will oblige us by sending in their communications by Tuesday morning at latest.

#### AMERICAN RAILROAD JOURNAL.

Published by D. K. MINOR, 105 Chestnut St., Philadelphia.

Saturday, March 27, 1847.

#### MISSING NUMBERS

##### OF THE RAILROAD JOURNAL.

Subscribers, who wish to obtain Missing Numbers of Back Volumes of this Journal, will do well to apply BEFORE the 1st of APRIL next, as, after that period, they cannot be obtained!

#### BOUND VOLUMES.

Volumes of this Journal, for the Years 1838 to 1846, INCLUSIVE, may be had Bound, at Subscription Price, on application at this Office.

One or two COMPLETE SETS of the RAILROAD JOURNAL may be had in a few weeks—or as soon as two numbers can be reprinted—by application to the Editor.

#### Boston and Maine Railroad.

The Twelfth Annual Report of this road will be found in this number. In its details it is in the prescribed form required by the Legislature. We shall continue to publish these reports, in their new form, that they may hereafter be referred to for comparison.

#### Slag and Iron.

##### Relative Proportions of Each.

The information contained in the following extract from a letter written by Mr. WM. FIRMSTONE, of the Glendon Iron Works, at Easton, Pa., may be useful to some of our readers. We are desirous of making the Journal useful in this line, and shall be much obliged by any communication giving useful information on the subject.

"I have been frequently asked how much cinder is usually made in making a ton of pig iron; having had occasion to weigh all the cinder made at our No. 2 Furnace for the last six months, I find it to exceed in weight the iron made about one-fifth. I annex a statement of the total number of tons of materials used in the Furnace, from Sept. 6, 1846, to Sept. 6, 1847—being 26 weeks.

Coal, iron ore and limestone used....10,156 tons.

Pig iron made.....2,085½ "

Slag, or cinder.....2,512 "

4,597½ tons."

#### New York and Erie Railroad.

We complete, in this number, the Report of the Commissioners appointed by the Legislature of New York to decide upon the location of this road. We give the profile of the different routes proposed—which, with the able report of the majority of the Commissioners, will, we think, satisfy every disinterested and unbiased person that the decision is a just one.

It will not, in this enlightened age, be allowed that the private and local interest of a few persons shall impose upon the whole business community a heavy tax, in the way of hauling the vast amount of produce and merchandize on railroads over the

hills—as in former years on the common and turnpike roads of the country.

#### Later from Europe, and the Iron Trade.

We have received, by the *Hibernia*, our London railway journals and periodicals to the 1st of March. They, however, contain little that is new or interesting.

The prices of iron vary but little from the last reports—rails being quoted on the 20th of February at £9 15s. to £10—and on the 27th at £9 10s. to £9 15s. Welsh cold blast at £5 5s. to £5 10s., and very little doing.

A correspondent of the Mining Journal says that, "Very little done this week in Welsh and Staffordshire, but several sales have been made of Scotch pig at 73s. 6d. to 74s., cash, for mixed Nos. and this market is looking firmer. Swedish is in more request, and about 450 tons were taken up yesterday." And Messrs. Whitcomb & Barton say that, "The demand for all kinds of manufactured iron continues good—prices unaltered; Scotch pig iron has been slightly dealt in during the week, it is reported at rather better rates. The market, however, is very quiet, and scarcely any disposition manifested to buy at quotations, except small lots for immediate consumption. English copper is in demand at the late advance, which it is believed will be firmly maintained. English lead is looking up, and very fair business doing. Tin plates continue dull of sale. In other metals, no alteration."

"The Glasgow pig iron trade was said to be, on the 24th, rather inert—prices for some time have continued nearly stationary. There is very little demand at present rates; yet, about 1s. under our quotation would find buyers to some extent. We have seldom seen less iron pressing on the market; holders are buoyed up with the hope of having a good spring demand, which prevents any further decline in prices for the present. Since our last, there have been few transactions, at 73s. 6d., and 74s., of mixed Nos., cash. To-day 74s. 6d. is the price asked. Contracts to some extent, for delivery at midsummer, have been made at 75s."

#### General Railroad Law.

The act to authorize the several railroad companies of the State of New York to raise money for the purpose of substituting the heavy iron rail for the flat bar now in use, which was introduced into the Senate by Mr. Williams, authorizes the directors of the several companies to borrow any amount, not to exceed \$10,000 per mile on the security of the several roads and appurtenances to carry out this object. The bill imposes a penalty in case the companies do not commence the work before the 1st day of January, after the passage of the act. In case the work is not done, the companies will not be al-

lowed to divide more than three per cent. per annum on the capital stock paid in for the present year, 1847, nor more than one per cent. per annum for each succeeding year; the surplus dividends to constitute a sinking fund, to be applied to the laying of the heavy rails. The neglect or refusal of the companies to substitute the heavy rail within three years, will be deemed to work a forfeiture of their charter. The act to take effect immediately. The bill is in charge of the railroad committee.

#### Fitch and Fulton.

We find in the last number of the Saturday Courier, a most excellent article upon the subject of steam and steamboats—which, but for its extreme length, we should have been happy to place before our readers. Its conclusion, as relates to Fitch and Fulton—the pioneers in this great modern discovery—we give below.

"Rumsey, as well as Fitch, attempted to construct a steamboat as early as 1783, and models of both their contrivances were exhibited in 1784, to Gen. Washington.

"Fitch's apparatus was a system of paddles working at the sides, like boat-oars. Rumsey at first used a pump, which drew in water at the bow, and forced it out at the stern of the boat. The latter afterwards employed poles, set in motion by cranks on the axis of the fly-wheel of his engine, which were intended to be pressed on the bottom of the river.

"About 1798, both applied for patents in England, but Rumsey alone, by the aid of influential friends, obtained one. He constructed a boat to run on the Thames, but did not live to witness the trial, which was a total failure; while a boat subsequently built by Fitch, accomplished *four miles per hour*—a great achievement at that time.

"In 1791, John Stevens, of Hoboken, commenced his experiments on steam navigation, and invented the first tubular boiler. He used Watts' engine, and after a long time succeeded in getting six miles per hour out of one of his boats."

Soon after, Livingston, Roosevelt and others, entered the field, with various success. In 1807, Fulton made his celebrated attempt on the Hudson, the success of which experiment has led to improvements which could scarcely have been dreamed of in his day!

#### Trenton Iron Works.

The Iron Works of Mr. PETER COOPER, at South Trenton, N. J., furnish constant employment to between 400 and 500 men, who, with their families, make a population of over 1000 souls. Mr. C. has petitioned the Legislature of New Jersey for an act of incorporation, to enable him to associate with him other individuals, a step rendered indispensably necessary by the increasing cares and responsibilities attendant on the enterprise. Mr. C.'s memorial contains some statistics respecting his works, a few of which we subjoin:

In one year 30 buildings have been erected in the immediate vicinity of the works, and 20 more are demanded by so large an addition to the inhabitants. Property has risen from 10 to 60 per cent., and lots which could scarcely be sold, now find ready purchasers. The agricultural productions for miles around are in steady demand, and every thing indicates increasing prosperity. The works turn out 40 tons of rails per day, and will be increased to 50: to be laid in New Jersey, New York, New England and Michigan. The amount of coal required to produce 50 tons of rails is 87½ tons and 62½ tons of pig iron, making 150 tons of raw material daily

consumed and converted into useful forms. The transportation of their articles, etc., 280 tons per day, pays a large revenue to the canal and railroad companies, and thus to the State, and business has nearly doubled since the establishment of the works. The product of the works for the next 12 months is sold. The payments are made in cash, and amount to \$5000 weekly, and the immense expense of erecting the works has been promptly met.

#### Telegraph Writing.

A prisoner—to whom we alluded a week or two ago, and who is now confined in the Penitentiary in Trenton, recently invented a machine for instantly taking the yeas and nays in the Legislature. He has been engaged for some time in constructing a machine for telegraph printing, which he accomplishes with more facility than can be achieved by the use of Morse's writing apparatus. The editor of the Trenton State Gazette, who has seen the machine, says of it:

"By simply striking at one end of the Telegraph a set of keys, each of which answers to a letter, or mark of punctuation, a communication will be printed at the other end of the wire. The keys may be touched as rapidly as the operator chooses. It does not require a certain time to make the letters, as in Morse's or House's invention. Touching the key does not make the letter; it only sets in motion an instrument which goes on itself very rapidly, makes the letter and then stops. All that the operator has to do, is to sit down at his key-board, with his communication before him, and touch the keys as fast as his fingers can do it."

The printing of the letters is said to be perfect.

#### Stonington Railroad.

Very favorable reports are given of the Stonington railroad, its receipts for six months ending Feb. 1, having been \$90,000 and its debt is reduced to \$580,000. It has been stated that too large an expenditure will be required to construct the line thro' to Olneyville, and this corporation desire to run a straight line on the west side of Providence, to intersect the Providence and Worcester railroads at the Cove. Great expectations are formed by Stonington railroad stockholders of increased business and receipts from this union of two roads from Massachusetts, the latter diverting travel from the Norwich line.

The receipts on the Norwich and Worcester railroad for February, 1847, were.....\$14,604  
February, 1846..... 14,286

Increase..... \$386

In regard to the late decline in this stock, says a late New York paper, one of the directors states in this city, that there is nothing in the condition or prospects of the corporation which warrants any decline in price. The business of the road is increasing over that of last year, which yielded \$90,000 net, after paying expenses, repairs, interest, etc.: or not far from 6 per cent. on the capital of 16,000 shares, at the par value of \$100 each.

The loss of the Atlantic, after deducting the earnings of the boat and the insurance, was \$70,000, and this precluded the possibility of a dividend in January. It is not supposed, however, that a similar loss is to be sustained every year.

The director referred to is very confident in the opinion that the Nashua and Worcester road now in progress of building, will yield a large accession of business to the Norwich road, and that the extension to New London will add largely to the value of the property. The real cause of the fall in the

stock is attributed mainly to the combined movements of certain stock operators who have sold extensively on time.

#### Mining on Lake Superior.

Congress has at length passed an act authorizing the sale of the mineral lands on Lake Superior, of which all the material provisions have been made public. If we rightly remember, remarks the Tribune, "all the lands about Lake Superior which are supposed to contain mineral wealth, are to be put up for sale at a minimum price of five dollars per acre, with the privilege to the purchaser of taking as much as he chooses, but not less than forty acres, which is the smallest legal subdivision. That portion of the mineral region now rightfully in possession of occupants, by virtue of leases or permits from the War Department, is offered to the holders at a minimum price of two dollars and a half per acre, provided the claimants take the whole tract covered by their permits respectively, many of them three miles and the rest one mile square. Squatters not claiming pre-emption, may take as low as forty acres; but if they claim pre-emption, they must take not less than a compact mile square—which seems to put them on a better footing than the holders of the three mile leases. We presume, however, that the latter, having made valuable improvements, will be entitled to waive their leases and claim as squatters, taking only a mile square. Otherwise it would be hard if those who were first among the explorers, and who have done most and expended most to render the mining region penetrable and habitable, should be subjected to harder conditions than the mere squatters of yesterday."

#### Corn for England.

The vast quantities of corn meal which have been ground by the Jersey millers for shipment to England, are pressing forward to New York to an extent beyond the means of transportation. The Newark Advertiser says—"We understand that four acres of Indian meal are lying at Elizabethport, Somerville, Trenton, and other places on the line of the railroads; the storehouses are full to overflowing. Freight trains are running on the railroads night and day, and are unable to keep up with the demand for transportation. About 300 teams loaded with Indian meal, averaging 40 bushels to the load, passed through Bound Brook on the way to New Brunswick."

#### Internal Improvements in Virginia.

We learn from the Richmond Enquirer that the House of Delegates has passed a bill for the extension of the James River and Kanawha canal. The State loans the company a six per cent. stock to the amount of \$1,235,000, to be expended as follows:—\$642,000, if so much shall be required, in completing the works of the said company from Lynchburg to the mouth of North river, and \$594,000, if so much shall be required, in extending and completing the canal from the mouth of North river to the town of Buchanan.

It secures the completion of a work which, while it will be no burthen upon the State, will develop the resources of the west, and will cement the two divisions of Virginia by an indissoluble bond of interest and feeling.

Another important bill was passed on Saturday, increasing the capital stock of the Staunton and Scottsville Macadamized turnpike road, by which the State subscribed to the amount of \$100,000.

The Richmond and Danville railroad bill was reconsidered and again rejected.

Thos. West, John Flint, A. Peirce, Samuel A. Walker, Henry B. Stone  
William F. Weld—Directors Boston and Maine Railroad.

SUFFOLK, ss. *Boston, January 29, 1847.*  
Then personally appeared Thos. West, John Flint, A. Peirce, Samuel A. Walker, Henry B. Stone and Wm. F. Weld, and made oath that the foregoing report was true, according to the best of their knowledge and belief.

Before me,  
EDW. PICKERING,  
Justice of the Peace.

The undersigned have examined the foregoing report of the directors of the Boston and Maine railroad corporation, and approve the same,

WILLIAM STEVENS,  
Comm'r for Massachusetts.  
GREENLEAF CLARKE,  
Comm'r of New Hampshire.

*Boston, January 29th, 1847.*

#### Direct Road from Boston to New York.

Two projects for railroad routes, are at this time before the Legislature of Massachusetts—having for their object, the establishment of a road from Boston to New York city. One of these—says the New York Tribune—"begins at South Boston or the South Cove, passing through Mount Pleasant in Roxbury, Dedham and Medway to Blackstone, and thence through Rhode Island and Connecticut, by way of Middletown to New Haven, and thence by way of the New Haven railroad, which is already begun, and the Harlem railroad, which is already in operation to the city of New York.

The other route begins at Charles street, near the Toll House, passes through Brookline, the south part of Newton, and Medway to Woonsocket and thence by railroads to be built through the States of Rhode Island and Connecticut, by way of Middletown to New Haven, and there to unite with the New Haven railroad already begun, as above stated. The two projects are substantially the same except as regards that part of the line which lies through a part of Massachusetts, the distance by each route being from 35 to 36 miles, and the length of a new railroad to be built for this special object in the States of Rhode Island and Connecticut, being something over 100 miles.

The Directors of the Boston and Worcester railroad have presented a long and able remonstrance against the grant of a charter for either of these routes. The grounds of the remonstrance are, that a new route to New York is not wanted—that the public travel is already as well accommodated by several routes, as on any line of communication in the United States and at cheaper rates of fare—that the whole travel, at present rates of fare, would not support a new route, and much less a part of it at reduced fares to be produced by increased competition—and that to grant a charter, the design of which is to produce a farther subdivision of this business, all of which now passes over one or more of four railroads, each established at a cost of more than \$2,000,000, under grants from the same Legislature, without any well-founded pretext of public utility, would be to interfere with interests which the Legislature is bound to protect. The remonstrance suggests also, that the works proposed from Boston to the Rhode Island border, are of too costly a character to be maintained by the amount of business on the route, and that the local accommodation can be afforded in a cheaper way, by branches leading to the neighboring railroads already established, terminating in Boston.

The decision of the Legislature will be looked for with deep interest. We agree with the Tribune in the opinion that the objections against the scheme

for a direct route between Boston and New York are no more plausible than were those formerly urged against all railroads. The companies already chartered must not look for exemption from the competition that attends all other business.

#### A Good Move.

The fare on the Philadelphia, Wilmington and Baltimore railroad has been reduced. The price of passage in the first class cars is now \$3, and in the second class \$2. The trains leave the depot in this city as heretofore, at 8 A.M., 4 P.M., and at 10 in the evening. This reduction in the price of fare will bring to the railroad a large proportion of the travel, south, this season—and the company will, unquestionably, find this plan very advantageous.

#### The Lena Iron Company.

The Cumberland Civilian states that a charter has been obtained to form a joint stock company, for the purpose of manufacturing nails, bar iron, etc., in that town. These works will be erected on the Lena Furnace grounds, and the furnace will form a part of the company's property. A site like the one proposed—when the contiguity of the railroad, ore, limestone, and the beauty and healthiness of the location are considered—can scarcely be equalled.

#### New Printing Press.

Hoe & Co., New York, have invented and put into successful operation at the office of the Philadelphia Ledger, a power press which achieves the wonderful result of working 12,000 sheets an hour. Instead of arranging a form in the usual way, the types are "made up" in sections of a large cylinder, one revolution of which brings off four legibly printed sheets. The fastest press before known in this country can only work between three and four thousand sheets an hour. This machine employs four feeders and four flyers, and works as rapidly as they can possibly be put on and take off the paper.

#### Smoke Consuming Apparatus.

A Liverpool paper says that a Mr. Williams has succeeded in applying successfully his smoke consuming apparatus to several furnaces and steam engines in that place. The contrivance, it states, has the advantage of rendering less coal necessary—an advantage of no inconsiderable importance. The smoke, after his plan has been applied, does not exceed that emitted from the chimney of a dwelling house. A similar apparatus applied to the gas houses and factories in this city would not only add greatly to the comforts of the residents in their vicinity, but materially, in most instances, increase the value of property.

#### Extraordinary Steam Hammer for Forging Iron.

There has recently been erected in the yard of Messrs. Peter Cato & Co., south end of the Brunswick dock, a huge hammer, worked by steam, on the plan and construction patented a short time ago by Mr. James Nasmyth, of Patricroft, near Manchester—an invention which will prove a valuable addition to the apparatus hitherto employed. The whole machine, and the furnace for bringing the iron to be wrought to a malleable white heat, are fixed under a large shed, open on three sides, and smoothly paved with fire tiles. The frame of this hammering engine (for so it may be called) consists of a massive flatish iron casting, forming a kind of arch, with strong abutments in the same piece, the whole well secured below, the bedding being on piles, as the ground in this

quarter is forced. In the interior, or opening of this arch, there are at its top part, which is partly filled up, perpendicular lateral grooves in the iron, to guide, in its descent and elevation, the heavy hammer, which maintains its vertical position, and is worked by a piston and rod, moving up and down with any required rapidity within a vertical cylinder, fixed on the top of the arch, and supplied with steam from a pipe overhead, connected with the boiler that supplies steam for the general machinery of the yard. The cylinder is 13 inches in diameter, and the extreme length of stroke of the hammer—a long square block of iron, weighing 22 cwt. is, from its top elevation to the anvil, 3 feet. The extreme force of the blow that may be given is equal to about five tons; but this may be instantly reduced to the most gentle tap, or any intermediate force between the two. The face of the hammer is flat, as is that of the anvil, which weighs 6½ cwt. One grand advantage is, that the face of the hammer being still a horizontal plane, whatever the thickness or shape of the iron to be beaten may be—a decided improvement over the ordinary tilt hammer—which, from its being fixed at the extremity of a bar, hits, on its descent, at continually varying angles of its face, the iron to be forged, according to the various thickness of the iron operated upon—the face, in fact, being horizontal at one point. The principal of the steam hammer is that of the piling machine, as the blow derives little or no force from the steam, but is imparted by the rapid descent of the falling mass suddenly let loose by cutting off the steam. There is an ingenious combination of long screws standing perpendicularly, and a valve and other handles, worked by one man, standing on a small elevated railed platform on one side the framework; and it is surprising with what rapidity and precision the length (downwards,) as well as the power of the blow, can be regulated by an adept, so as to strike the hot iron, whatever its thickness, with the required force, and nothing more. A walnut may be cracked without bruising the kernel. Not only is the hammer a powerful means of fashioning iron knees, knee moulds, anchors, moulds, etc., and other heavy work; but it is applicable to the forging into moulds all kinds of scrap iron, from rivet-holes or clippings, old nails, broken bolts, etc. We witnessed this redeeming process with surprise and gratification. The scrap iron is made up as best may be into squares or piles. One of these is put into the furnace, and in a very short time, attaining a white heat, is welded or united together in one glowing mass. A long bar of iron is then introduced into the furnace; and the end of it being put upon the top of the mass, becomes almost instantly combined or united with it. The mass is then drawn out by the bar, and conveyed rapidly on an iron wagon, commonly called a trawley, from the furnace mouth to the anvil—the top of the wagon being precisely of the same height as both. A single man holds the bar, and by it turns the iron as required, while the ponderous hammer is let down upon it, in blows that shake

the adjacent ground for some distance around, and deals with the glowing iron as if it were as soft as putty, crushing out all the bad, and leaving the good. Comparatively few blows are required to form it into a square bloom, ready as new iron to be beaten out or attenuated at minor forges into any required form or article. The scrap iron, which is worth only about £5 per ton, is by the operation rendered of the value of £10 to £12. The chimney of the furnace is of curious construction. It is cased round with common brick to the top, supported below on four cast iron pillars, and secured with tension rods outwardly secured at the four angles. There are also openings in the casement. By this means the fire bricks of the chimney, which frequently require renewal from being burnt away, may be taken out at any part, and replaced by new ones.—*Liverpool Standard.*

## ITEMS.

**New Musical Instrument.**—A correspondent at Rome, Mich., writing to the editor of the "Eureka," says:—"I have a petition pending for a patent upon a new parlor instrument, which I call an *Organ Piano*—as it possesses the qualities of both the pipe organ and piano forte—so nearly that a good performer can imitate either instrument so perfectly as to deceive an experienced ear.—It is made in the form of square horizontal piano forte, though the form may be varied to taste. It is judged to possess at least three times the power of a piano forte and the swell is comparatively PERFECT; from the softest tone of the Æolian Harp to the body of a six stop organ, and is effected with pedals and the fingers like the piano forte. It is well adapted to the slowest church, or the quickest waltz music, or any movement whatever. In compass 6 to 7 octaves. I fully believe it to be more durable than any keyed instrument of which I have any knowledge, from constant trial for more than four years. I have arrived at certain principles or "ways of doing it," which have been faithfully tested ever since, and not a tone has failed. Since then I have been striving to perfect my invention. While it possesses all of the above named properties and many others desirable, it is not like Coleman's "Attachment," two instruments, but it is but one separate and independent instrument—in and of itself, and is tuned once for ever, judging according to past experience, etc.

Respectfully yours, R. N.

"P. S. The expense of making my instruments is about the same as of piano fortes of same compass."

**Railroad to Albany.**—The Hudson river railroad company have made the required return to the comptroller of the State, to secure their charter. The company have also petitioned for an amendment to their charter, that will allow them to pay interest on instalments, as in the case of the Erie road—a request that should be granted at once. The company also ask that the clause relating to the appointment of appraisers shall be made plainer.

In the act of incorporation, a director in this company is prohibited from being a di-

rector in any other railroad company in this State. The petitioners doubt the expediency of this provision, and ask for its repeal.

The company are also required to spend a large sum in a given time, and as it cannot be done profitably, ask an extension of the time. The charter was obtained amid much competition, and needs to be amended. It is but right that its construction should be made as easy and cheap as possible.—*N. Y. Tribune.*

**Trouble.**—There has been a disturbance on the Worcester and Providence railroad, a large number of laborers having struck for higher wages, and passed along the line compelling the other laborers to quit work and join them. Mr. Campbell, one of the contractors was knocked down. Preparations were making to oppose and disperse the mob, and arrest the rioters, when they departed in different directions. It is said that the men were encouraged to do violence by others who were not employed on the road, but we cannot learn what was the grievance complained of.

**Manufacture of Paper in the United States.**—From statistical documents presented before Congress, it appears that the capital employed in the manufacture of paper in the United States, is \$10,000,000. The number of mills, 700; the annual produce, \$17,000,000; and the number of operatives employed, 100,000.

**Damages for Injuries.**—Mr. Walter Urquhart and wife, recently instituted in one of the courts at New Haven a suit against the Connecticut River Steamboat Company, for injuries sustained by the latter on board one of the company's boats, in 1845. Mrs. U. had her arm broken and received other injuries, whilst being landed at night in a small boat. The evidence showed negligence on the part of the steamboat officers, and the jury gave a verdict for the plaintiffs for \$1575.

**Internal Improvement Bills.**—The Richmond papers contain exulting articles in reference to the passage, by the Virginia House of Delegates, of two important internal improvement bills.

One is the bill appropriating \$1,230,000, in semi-annual instalments, to the extension of the James River and Kanawha canal.—This sum it is estimated will carry the work to Buchanan.

The other is the bill increasing the capital stock of the Staunton and Scottsville turnpike company, to enable it to Macadamize its road between these two points. Scottsville is on the James river canal.—*Sav. Republican.*

☞ The increase of the receipts on the Reading railroad for December, January and February, over the same months of last year, has been about \$170,000. The rumor of a coalition between this company and the Schuylkill Navigation is without foundation.

☞ The bill to incorporate the Easton and Somerville road, passed in the New Jersey Senate, has had two readings in the House. The capital of the company is \$1,200,000, with the privilege to increase it to \$2,000,000. The route prescribed is from Somerville north

to the Muscouctcong valley, passing within two miles of Clinton, Hunterdon county; thence to the valley of the Delaware river, and then up to within two miles of the Delaware bridge, opposite Easton. It provides also that it shall not interfere with the Camden and Amboy road, and shall pay the half of one per cent. tax on the cost of the road to the State.

☞ The proprietors of the Lackawanna iron works have contracted to furnish the N. York and Erie railroad company with railroad iron to the amount of \$400,000.

**Railroads in Massachusetts.**—There are so many applications for railroad charters before the Legislature of Massachusetts, that three committees have been appointed to attend to them. The number of routes and cross routes is said to be about fifty.

**The Longest Train.**—A correspondent of the Rochester Democrat says: "On our way eastward we passed the longest train of cars on the Albany and Boston road that has ever crossed the track. It was composed of 122 cars, of an average length of 32 feet each, making a train of 3700 feet, or nearly three-quarters of a mile long, and all drawn by one powerful engine."

**Old Colony Road.**—A comparison of receipts upon the Old Colony railroad from December 1, to February 21, gives a total of \$26,891 this year, to \$19,296 in 1845-6.—On the Fitchburg and Fresh Pond branch railroads, the gain in February over that month of last year was over one-third.

**Earnings of the Macon and Western Railroad for February, 1847.**—Through travel, \$1,138 21; local do., \$3,225 05; mail do., \$383 60; freight, \$5,719 29. Total, \$10,493 15.

**Large Castings.**—We learn from the Philadelphia Ledger, that Messrs. Merrick & Towne have just completed a powerful hydraulic press, for the manufacture of leaden pipe, and are now engaged in shipping the requisite castings on board the brig Mail, for this city, being intended for the lead factory of the Messrs. Stern. One of the castings, a cylinder for the press, weighed four tons and a half.

**RAILROAD IRON.—THE "MONTGOMERY" Iron Company,** Danville, Pa., is prepared to execute orders for the heavy Rail Bars of any pattern now in use, in this country or in Europe, and equal in every respect in point of quality. Apply to **MURDOCK, LEAVITT & CO.,** Agents.

1y48

77 Pine St., New York.

**RAILWAY IRON.—DAVIS, BROOKS & Co.,** No. 68 Broad Street, have now in port on Ship-board, 200 Tons of the best English heavy H Rails, 60 lbs. to the lineal yard, which they offer for sale on favorable terms, also, about 6 to 700 Tons now on the way, to arrive shortly, of the same description of Rail. 464

**PIG AND BLOOM IRON.—THE SUBSCRIBERS** are agents for the sale of numerous brands of Charcoal and Anthracite Pig Iron, suitable for Machinery, Railroad Wheels, Chains, Hollowware, etc. Also several brands of the best Puddling Iron, Juniatta Blooms suitable for Wire, Boiler Plate, Axe Iron, Shovels, etc. The attention of those engaged in the manufacture of iron is solicited by **A. WRIGHT & NEPHEW,** Vine St. Wharf, Philadelphia.

121f

**NICOLL'S PATENT SAFETY SWITCH** for Railroad Turnouts. This invention, for some time in successful operation on one of the principal railroads in the country, effectually prevents engines and their trains from running off the track at a switch, left wrong by accident or design.

It acts independently of the main track rails, being laid down, or removed, without cutting or displacing them.

It is never touched by passing trains, except when in use, preventing their running off the track. It is simple in its construction and operation, requiring only two Castings and two Rails; the latter, even if much worn or used, not objectionable.

Working Models of the Safety Switch may be seen at Messrs. Davenport and Bridges, Cambridgeport, Mass., and at the office of the Railroad Journal, New York.

Plans, Specifications, and all information obtained on application to the Subscriber, Inventor, and Patentee  
**G. A. NICOLLS,**  
Reading, Pa.

**RAILROAD IRON.—THE SUBSCRIBER'S** New Rail Iron Mill at Phoenixville, Pa., is expected to be ready to go into operation by the 1st of September, and will be capable of turning out 30 to 40 tons or finished Rails per day. They are now prepared to receive orders to that extent, deliverable after the 1st of October next, for heavy rails of any pattern now in use, equal in quality and finish to best imported.

**PIG IRON.**—They are also receiving weekly 150 to 200 tons of No. 1 Phoenix Foundry Iron, well adapted for light castings.

**REEVES, BUCK & CO,**  
45 North Water St., Philadelphia,  
or by their Agent, **ROBT. NICHOLS,**  
79 Water St., New York.

**THE SUBSCRIBERS, AGENTS FOR** the sale of  
Codorus,  
Glendon,  
Spring Mill and  
Valley, } Pig Iron.

Have now a supply, and respectfully solicit the patronage of persons engaged in the making of Machinery, for which purpose the above makes of Pig Iron are particularly adapted.

They are also sole Agents for Watson's celebrated Fire Bricks and prepared Kaolin or Fire Clay orders for which are promptly supplied.

**SAM'L. KIMBER, & CO.,**  
59 North Wharves,  
Philadelphia, Pa.

Jan. 14, 1846.

[1y4]

Philadelphia, Pa.

**RAY'S EQUALIZING RAILWAY TRUCK.—THE SUBSCRIBER** having recently formed a business connection in the City of New

York, expressly for the manufacture of the newly patented and highly approved Railroad Truck of Mr. Fowler M. Ray, is ready to receive orders for building the same, from Railroad Companies and Car Builders in the United States, and elsewhere.

The above Truck has now been in use from one to two years on several roads a sufficient length of time to test its durability, and other good qualities, and to satisfy those who have used it, as may be seen by reference to the certificates which follow this notice.

There have been several improvements lately introduced upon the Truck, such as additional springs in the bolster of passenger cars, making them delightful riding cars—adapting it to tenders, trucks forward of the locomotive, and freight cars, which, with its original good qualities, make it in all respects the most desirable truck now offered to the public.

Orders for the above, will, for the present, be executed at the New York Screw Mill, corner 33d street and 3d avenue, (late P. Cooper's rolling mills) and at the Steam Engine Shop of T. F. Secor & Co., foot of 9th street, East

**RAILROAD IRON.—THE NEW JERSEY** Iron Company, Boonton, N. J., are now preparing to make Railroad Bars, and are ready to take orders or make contracts for Rails, deliverable after the first of December next. Apply to

**FULLER & BROWN, Agent,**  
No. 139 Greenwich, corner of Cedar street.  
September 18, 1846.

**LAWRENCE'S ROSENDALE HYDRAULIC** Cement. This cement is warranted equal to any manufactured in this country, and has been pronounced superior to Francis' "Roman." Its value for Aqueducts, Locks, Bridges, Floors and all Masonry exposed to dampness, is well known, as it sets immediately under water, and increases in solidity for years.

For sale in lots to suit purchasers, in tight papered barrels, by **JOHN W. LAWRENCE,**  
142 Front street, New York.

Orders for the above will be received and promptly attended to at this office.

**ENGLISH PATENT WIRE ROPES—FOR THE USE OF MINES, RAILWAYS, ETC.**—for sale or imported to order by the subscriber.

These Ropes are manufactured on an entirely different principle from any other, and are now almost exclusively used in the collieries and on the railways in Great Britain, where they are considered to be greatly superior to hempen ones, or iron chains, as regards safety, durability and economy. The plan upon which they are made effectually secures them from corrosion in the interior, as well as the exterior of the rope, and gives a greater compactness and elasticity than is found in any other manufacture.

Many of these ropes have been in constant operation in the different mines in England, and on the Blackwall and other inclined planes, for three and four years, and are still in good condition.

They have been applied to almost every purpose for which hempen ropes have been used—mines, heavy cranes, standing rigging, window cords, lightning conductors, signal halyards, tiller ropes, etc. Reference is made to the annexed statement for the relative strength and size. Testimonials from the most eminent engineers in England can be shown as to their efficiency, and any additional information required respecting the different descriptions and application will be given by

**ALFRED L. KEMP,**  
75 Broad street, New York, sole agent in the United States.

*Statement of Trial made at the Woolwich Royal Dock Yard, of the Patent Wire Ropes, as compared with Hempen Ropes and Iron Chains of the same strength.—October, 1841.*

WIRE ROPES.			HEMPEN ROPES.			CHAINS.			STRENGTH Tons.

river, (of which firm the subscriber was late a partner) under the immediate supervision of Mr. Ray himself.

Several sets of trucks containing the latest improvements have recently been turned out for the New York and Erie railroad, and the New Jersey Transportation company, which may be seen upon said roads.

The patronage of Railroad Companies and Car Builders is respectfully solicited.

New York, May 4, 1846.

**W. H. CALKINS, and Others.**

To all whom it may concern:—This is to certify that the New Haven, Hartford and Springfield railroad co. have had in use six sets of F. M. Ray's patent trucks for the last 20 months, during which time it appears to me, they have proved to be the best and most economical truck now in use.

[Signed,]

**WILLIAM ROX, Supt. of Power.**

I certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Philadelphia and Reading railroad for some time past, under a passenger car.

For simplicity of construction, economy in cost, lightness of material, and extreme ease of motion, I consider it the best truck we have ever used. Its peculiar make also renders it less liable to be thrown off the track, when passing over any obstruction. We intend using it extensively under the passenger and freight cars of the above road.

Reading, Pa., October 6, 1845.

[Signed,] **G. A. NICOLLS,**

Supt. Transportation, etc., Philadelphia and Reading Railroad.

To all whom it may concern:—This is to certify that the N. Jersey Railroad and Transportation company have used Fowler M. Ray's Truck for the last seven months, during which time it has operated to our entire satisfaction. I have no hesitation in saying that it is the simplest and most economical truck now in use.

[Signed,] **T. L. SMITH,**

Jersey City, November 4, 1845. N. Jersey Railroad and Transp. Co.

This is to certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Long Island railroad for the last year, under a freight car. For simplicity of construction, economy in cost, lightness of material and ease of motion, I consider it equal to any truck we have in use.

Long Island Railroad Depot,

[Signed,] **JOHN LEACH,**

Jamaica November 12, 1846.

1y19 Supt. Motive Power.

**RICH & CO'S IMPROVED PATENT SALAMANDER SAFES.**

Warranted free from dampness, as well as fire and theft proof.

Particular attention is invited to the following certificates, which speak for themselves:

**TEST No. 10.**

*Certificate from Mr. Silas C. Field, of Vicksburg, Mississippi.*

On the morning of the 14th ult., the store owned and occupied by me in this city, was, with its contents, entirely consumed by fire. My stock of goods consisted of oil, rosin, lard, pork, sugar, molasses, liquors, and other articles of a combustible nature, in the midst of which was one of Rich's Improved Patent Salamander Safes, which I purchased last October of Mr. Isaac Bridge, New Orleans, and which contained my books and papers. This safe was red hot, and did not cool sufficiently to be opened until 16 hours after it was taken from the ruins. At the expiration of that time it was unlocked, when its contents proved to be entirely uninjured, and not even discolored. I deem this test sufficient to show that the high reputation enjoyed by Rich's Safes is well merited. S. C. FIELD.

**TEST No. 11.—Certificate.**

By the fire which occurred in this village on the 27th July last, our Law Office, together with many other buildings, was destroyed—we had in our office one of Rich's Improved Patent Salamander Safes, which, though heated red hot, preserved, without being the least damaged, many papers valuable to our clients—the envelopes of a few papers being slightly scorched. Some twenty-four hours after the fire, the Safe was removed, and so hot was it, that several hours were required for it to cool off. Our office was in the second story of a large brick building, all the wood used in construction of said house being pitch pine. While the Safe was red hot, one of the walls tumbled in, and so injured the lock that it was necessary to break the door open. From this test, we feel no hesitancy in recommending "Rich's Patent Salamander Safe" as *entirely fire proof*.

GORE & KING.

Marion, Ala., Sept. 15th, 1846.

*Still other Tests in the Great Fire of July 19, 1845.*

The undersigned purchased of A. S. Martin, No. 138½ Water street, one of Rich's Improved Patent Salamander Safes, which was in our store, No. 54 Exchange place. The store was entirely consumed in the great conflagration on the morning of the 19th inst. The safe was taken from the ruins 52 hours after, and on opening it, the books and papers were found entirely uninjured by fire, and only slightly wet—the leather on some of the books was parched by the extreme heat. RICHARDS & CRONKHITE.

Benton, Miss., December 27, 1845.

One of Rich's Improved Salamander Safes, which I purchased on the 2d of June last of A. S. Marvin, 138½ Water street, agent for the manufacturer, was exposed to the most intense heat during the late dreadful conflagration. The store which I occupied, No. 46 Broad street, was entirely consumed; the safe fell from the 2d story, about 15 feet, into the cellar, and remained there 14 hours, and when found, I am told, and from its appearance afterwards, should judge that it had been heated to a red heat. On opening it, the books and papers were found not to have been touched by fire. I deem this ordeal sufficient to confirm fully the reputation that Rich's safe has already obtained for preserving its contents against all hazards. (Signed.) WM. BLOODGOOD.

New York, 21st July, 1845.

Reference made to upwards of nine hundred and fifty merchants, cashiers, brokers, and officers of courts and counties, who have Rich's Safe's in use.

The above safes are finished in the neatest manner, and can be made to order at short notice, of any size and pattern, and fitted to contain plate, jewelry, etc. Prices from \$50 to \$500 each. For sale by

A. S. MARVIN, General Agent,  
138½ Water st., N. Y.

Also by Isaac Bridge 76 Magazine street, New Orleans.

Also by Lewis M Hatch, 190 Meeting street  
Charleston, S. C. 16 11

**FRENCH AND BAIRD'S PATENT SPARK ARRESTER.**

TO THOSE INTERESTED IN Railroads, Railroad Directors and Managers are respectfully invited to examine an improved SPARK ARRESTER, recently patented by the undersigned.

Our improved Spark Arresters have been extensively used during the last year on both passenger and freight engines, and have been brought to such a state of perfection that no annoyance from sparks or dust from the chimney of engines on which they are used is experienced.

These Arresters are constructed on an entirely different principle from any heretofore offered to the public. The form is such that a rotary motion is imparted to the heated air, smoke and sparks passing through the chimney, and by the centrifugal force thus acquired by the sparks and dust they are separated from the smoke and steam, and thrown into an outer chamber of the chimney through openings near its top, from whence they fall by their own gravity to the bottom of this chamber; the smoke and steam passing off at the top of the chimney, through a capacious and unobstructed passage, thus arresting the sparks without impairing the power of the engine by diminishing the draught or activity of the fire in the furnace.

These chimneys and arresters are simple, durable and neat in appearance. They are now in use on the following roads, to the managers and other officers of which we are at liberty to refer those who may desire to purchase or obtain further information in regard to their merits:

R. L. Stevens, President Camden and Amboy Railroad Company; Richard Peters, Superintendent Georgia Railroad, Augusta, Ga.; G. A. Nicolls, Superintendent Philadelphia, Reading and Pottsville Railroad, Reading, Pa.; W. E. Morris, President Philadelphia, Germantown and Norristown Railroad Company, Philadelphia; E. B. Dudley, President W. and R. Railroad Company, Wilmington, N. C.; Col. James Gadsden, President S. C. and C. Railroad Company, Charleston, S. C.; W. C. Walker, Agent Vicksburg and Jackson Railroad, Vicksburg, Miss.; R. S. Van Rensselaer, Engineer and Sup't Hartford and New Haven Railroad; W. R. M'Kee, Sup't Lexington and Ohio Railroad, Lexington, Ky.; T. L. Smith, Sup't New Jersey Railroad Trans. Co.; J. Elliott, Sup't Motive Power Philadelphia and Wilmington Railroad, Wilmington, Del.; J. O. Sterns, Sup't Elizabethtown and Somerville Railroad; R. R. Cuyler, President Central Railroad Company, Savannah, Ga.; J. D. Gray, Sup't Macon Railroad, Macon, Ga.; J. H. Cleveland, Sup't Southern Railroad, Monroe, Mich.; M. F. Chittenden, Sup't M. P. Central Railroad, Detroit, Mich.; G. B. Fisk, President Long Island Railroad, Brooklyn.

Orders for these Chimneys and Arresters, addressed to the subscribers, care Messrs. Baldwin & Whitney, of this city or to Hinckley & Drury, Boston, will be promptly executed. FRENCH & BAIRD.

N. B.—The subscribers will dispose of single rights, or rights for one or more States, on reasonable terms. Philadelphia, Pa., April 6, 1844.

.. The letters in the figures refer to the article given in the Journal of June, 1844. ja45

**PATENT HAMMERED RAILROAD, SHIP and Boat Spikes.** The Albany Iron and Nail Works have always on hand, of their own manufacture, a large assortment of Railroad, Ship and Boat Spikes, from 2 to 12 inches in length, and of any form of head. From the excellence of the material always used in their manufacture, and their very general use for railroads and other purposes in this country, the manufacturers have no hesitation in warranting them fully equal to the best spikes in market, both as to quality and appearance. All orders addressed to the subscriber at the works, will be promptly executed. JOHN F. WINSLOW, Agent.

Albany Iron and Nail Works, Troy, N. Y. The above spikes may be had at factory prices, of Erastus Corning & Co., Albany; Hart & Merritt, New York; J. H. Whitney, do.; E. J. Eting, Philadelphia; Wm. E. Coffin & Co., Boston. ja45

**MACHINE WORKS OF ROGERS,** Ketchum & Grosvenor, Patterson, N. J. The undersigned receive orders for the following articles, manufactured by them of the most superior description in every particular. Their works being extensive and the number of hands employed being large, they are enabled to execute both large and small orders with promptness and despatch.

Railroad Work. Locomotive steam engines and tenders; Driving and other locomotive wheels, axles, springs & flange tires; car wheels of cast iron, from a variety of patterns, and chills; car wheels of cast iron with wrought tires; axles of best American refined iron; springs; boxes and bolts for cars.

Cotton, Wool and Flax Machinery of all descriptions and of the most improved patterns, style and workmanship.

Mill gearing and Millwright work generally; hydraulic and other presses; press screws; callenders; lathes and tools of all kinds; iron and brass castings of all descriptions.

ROGERS, KETCHUM & GROSVENOR,  
ja45 Paterson, N. J., or 60 Wall street, N. York. 11

**PATENT RAILROAD, SHIP AND BOAT Spikes.** The Troy Iron and Nail Factory keeps constantly for sale a very extensive assortment of Wrought Spikes and Nails, from 3 to 10 inches, manufactured by the subscriber's Patent Machinery, which after five years' successful operation, and now almost universal use in the United States (as well as England, where the subscriber obtained a patent) are found superior to any ever offered in market.

Railroad companies may be supplied with Spikes having countersink heads suitable to holes in iron rails, to any amount and on short notice. Almost all the railroads now in progress in the United States are fastened with Spikes made at the above named factory—for which purpose they are found invaluable, as their adhesion is more than double any common spikes made by the hammer.

All orders directed to the Agent, Troy, N. York will be punctually attended to.

HENRY BURDEN, Agent.

Spikes are kept for sale, at Factory Prices, by I. & J. Townsend, Albany, and the principal Iron merchants in Albany and Troy; J. I. Brower, 222 Water St., New York; A. M. Jones, Philadelphia; T. Janviers, Baltimore; Degrand & Smith, Boston.

.. Railroad Companies would do well to forward their orders as early as practicable, as the subscriber is desirous of extending the manufacturing so as to keep pace with the daily increasing demand. ja45

**SPRING STEEL FOR LOCOMOTIVES,** Tenders and Cars. The Subscriber is engaged in manufacturing Spring Steel from 1½ to 6 inches in width, and of any thickness required: large quantities are yearly furnished for railroad purposes, and wherever used, its quality has been approved of. The establishment being large, can execute orders with great promptitude, at reasonable prices, and the quality warranted. Address

JOAN F. WINSLOW, Agent,  
Albany Iron and Nail Works,

# DAVENPORT & BRIDGES'

## CAR WORKS, CAMBRIDGEPORT, MASS.

Manufacture to Order, Passenger and Freight Cars of every description, and of the most improved pattern; also furnish Snow Ploughs and Chilled Wheels of any pattern and size. Forged Axles, Springs, Boxes and Bolts for Cars at the lowest prices.

All orders punctually executed and forwarded to any part of the country.

Our Works are within fifteen minutes ride from State street, Boston—Omnibuses pass every fifteen minutes.

## THE HERRON RAILWAY TRACK,

As seen stripped of the top ballasting

A GOLD MEDAL AWARDED THE INVENTOR BY THE AMERICAN INSTITUTE.

**THE UNDERSIGNED RESPECTFULLY** invites the attention of Engineers, and Railroad Companies, to some highly important improvements he has recently made in the Herron system of Railway structure. These improvements enable him to effect a very large reduction in the quantity of Timber, and cost of construction, without impairing the strength of the Track, or its powers of resisting frost, while they secure additional features of excellence in the Drainage and facility of making Repairs.

The above cut represents the "Herron Track" as it is laid on the Philadelphia and Reading, and on the Baltimore and Susquehanna Railroads. The intersection of the sills of the trellis is 5 feet from centre to centre, while in the new construction they are only 2½ feet. This renders the string piece unnecessary, thus removing the only objectionable feature found in the Track.

The result of experience has proved that all Tracks constructed with longitudinal timbers, such as mud sills, and more especially, the continuous bearing string pieces retain the rain water that falls between the Rails, which, being thus confined, settles along those timbers, and accumulating in quantity flows rapidly along them on the descending grades, washing out the earth from under the timber, and frequently causing large breaches in the embankments of the road. Whereas all water intercepted by the oblique sills of the trellis, is discharged immediately into the side ditches.

In the 5 foot plan, the Track occupies a Road bed nearly 11 feet wide, while the new construction takes

but 8 feet; the timber being more concentrated under the Rails. A block of hard wood, about 2 feet long and 15 inches wide, is introduced into a square of the trellis for the purpose of giving an additional, and effectual support to the joints of the Rails, which rest upon it. Should these joint blocks become chafed and worn by the working, and imbedding of the chairs, as is now the case on all Railroads, they can be readily replaced without any derangement of the timbers less liable to wear.

The following is a general estimate of its cost near the seaboard. In the interior it will be considerably less.

ESTIMATE OF THE PROBABLE COST OF ONE MILE.		
4,224 Timbers, 11 ft. long, 3 x 6 inches =	68,696 ft. b.m., at \$10 =	\$686 96
587 Oak joint blocks 2 ft. x 3 x 15 in. =	4,403 ft. b.m., at \$13 =	57 24
13,000 Spikes = 2,350 lbs. at 4½ cts =		101 25
Workmanship free of patent charge.		600 00

Cost of one mile including the laying of the Rail.....\$1,445 45

He has made other important improvements, which will be shown in properly proportioned models, that give a much better idea of the great strength of the Track than a drawing will do.

Sales of the Patent right to all the distant States will be made on liberal terms.

## FRANKLIN HOUSE,

No. 105 Chestnut Street, Philadelphia.

The undersigned takes the liberty of calling the attention of the readers of the Journal to the fact that the Office is removed from New York to the Franklin House, Philadelphia, where he will be always pleased to meet and greet them. They will not only find a pleasant Reading Room, with lots of foreign periodicals, treating of Railroads and Machinery, but they will always find good-sized and airy rooms—clean beds—and a well supplied table. If they would have further proof of this, they have only to call, and judge for themselves, and much oblige the proprietor,

## BOSTON AND PROVIDENCE RAILROAD. Passenger Notice. Summer Arrangement. On and after Monday, Sept. 28, 1846, the Passenger Trains will run as follows:

For New York—Night Line, via Stonington. Leaves Boston every day, but Sunday, at 5 p.m.

Accommodation Trains, leave Boston at 7½ a.m. and 3½ p.m., and Providence at 8 a.m. and 3½ p.m.

Dedham trains, leave Boston at 9 a.m.; 3 p.m., 5½ p.m., and 10½ p.m. Leave Dedham at 8 a.m. and 4½ and 9 p.m.

Stoughton trains, leave Boston at 11½ a.m. and 4-10 p.m. Leave Stoughton at 8 a.m. and 2½ p.m.

All baggage at the risk of the owners thereof.

31 ly W. RAYMOND LEE, Sup't.

BRANCH RAILROAD AND STAGES CONNECTING with the Boston and Providence Railroad.

Stages connect with the Accommodation trains at the Foxboro' Station, to and from Woonsocket. At the Seekonk Station, to and from Lonsdale, R. I. via Pawtucket. At the Sharon Station, to and from Walpole, Mass. And at Dedham Village Station, to and from Medford, via Medway, Mass. At Providence, to and from Bristol, via Warren, R. I.—Taunton, New Bedford and Fall River cars run in connection with the accommodation trains.

## PHILADELPHIA AND READING RAILROAD.—Passenger Train Arrangement for 1847.

A Passenger Train will leave Philadelphia and Pottsville daily, except Sundays, at 9 o'clock A.M.

The Train from Philadelphia arrives at Reading at 12 18 M.

The Train from Pottsville arrives at Reading at 10 43 A.M.

Between Phila. and Pottsville, 93 \$3.50 and \$3.00  
" " Reading, 58 2.25 and 1.90  
" Pottsville " 34 1.40 and 1.20

Five minutes allowed at Reading; and three at other way stations.

Passenger Depot in Philadelphia corner of Broad and Vine streets. 80

## LEXINGTON AND OHIO RAILROAD.

Trains leave Lexington for Frankfort daily, at 5 o'clock a.m., and 2 p.m.

Trains leave Frankfort for Lexington daily, at 8 o'clock a.m. and 2 p.m. Distance, 26 miles. Fare \$1.25.

On Sunday but one train, 5 o'clock a.m. from Lexington, and 9 o'clock p.m. from Frankfort.

The winter arrangement (after 15th September to 15th March) is 6 o'clock a.m. from Lexington, and m. 9. from Frankfort, other hours as above. 35ly

## BOSTON AND MAINE RAILROAD.

Upper Route, to Portland and the East.

SPRING ARRANGEMENT, March 1, 1847.

PORTLAND TRAINS.

Leave Boston at 7½ A.M. and 2½ P.M.  
Leave Portland at 7½ A.M. and 3 P.M.

GREAT FALLS TRAIN.

Leave Boston at 4½ P.M.  
Leave Great Falls at 6½ A.M.

HAVERHILL TRAINS.

Leave Boston at 11½ A.M. and 5-50 P.M.  
Leave Haverhill at 6½ A.M. and 4 P.M.

READING TRAINS.

Leave Boston at 9 A.M. and 8 P.M.  
Leave Reading at 6½ A.M. and 1½ P.M.

MEDFORD BRANCH TRAINS.

Leave Boston at 7½, 9 A.M., 2½, 5-50 P.M.  
Leave Medford at 6½, 8 A.M., 1½, 5½ P.M.

The Depot in Boston is on Haymarket Square. Passengers are not allowed to carry Baggage above \$50 in value, and that personal, unless notice is given, and an extra amount paid, at the rate of the price of a Ticket for every \$500 additional value.

1531 CHAS. MINOT, Super't.

## SUMMER ARRANGEMENT.—NEW YORK AND ERIE RAILROAD LINE, from April 1st until further notice, will

run daily (Sundays excepted) between the city of New York and Middletown, Goshen, and intermediate places, as follows:

FOR PASSENGERS—

Leave New York at 7 A.M. and 4 P.M.  
" Middletown at 6½ A.M. and 5½ P.M.

Fare reduced to \$1.25 to Middletown—way in proportion. Breakfast, supper and berths can be had on the steamboat.

FOR FREIGHT—

Leave New York at 5 P.M.  
" Middletown at 12 M.

The names of the consignee and of the station where to be left, must be distinctly marked upon each article shipped. Freight not received after 5 P.M. in New York.

Apply to J. F. Clarkson, agent, at office corner of Duane and West sts. H. C. SEYMOUR, Sup't.

March 25th, 1846.

Stages run daily from Middletown, on the arrival of the afternoon train, to Milford, Carbondale, Honesdale, Montrose, Towanda, Owego, and West; also to Monticello, Windsor, Binghamton, Ithaca, etc., etc. Agent on board. 13 d

## NORWICH AND WORCESTER RAILROAD. Summer Arrangement, commencing

Monday, April 6, 1846.

Accommodation Trains, daily, except Sunday. Leave Norwich, at 6 a.m., and 4½ p.m. Leave Worcester, at 10 a.m., and 4½ p.m.

The morning Accommodation Trains from Norwich, and from Worcester, connect with the trains of the Boston, and Worcester and Western railroads each way.

The Evening Accommodation Train from Worcester connects with the 1½ p.m. train from Boston.

New York Train via Long Island Railroad: Leave Allyn's Point for Boston, about 1 p.m., daily, except Sunday.

Leave Worcester for New York, about 10 a.m., stopping at Webster, Danielsonville, and Norwich.

New York Train via Steamboat—Leave Norwich for Boston, every morning, except Monday, on the arrival of the steamboat from New York, stopping at Norwich and Danielsonville.

Leave Worcester for New York, upon the arrival of the train from Boston, at about 4½ p.m., daily, except Sunday, stopping at Webster, Danielsonville and Norwich.

Freight Trains daily each way, except Sunday.—Special contracts will be made for cargoes, or large quantities of freight, on application to the superintendent.

Fares are Less when paid for Tickets than when paid in the Cars. 43

J. W. STOWELL, Sup't

**TROY RAILROADS.—IMPORTANT NOTICE.**—Troy and Greenbush Railroad, forming a continuous track from Boston to Buffalo and Saratoga Springs. This road is new, and laid with the heaviest iron H rail. Trains will always be run on this road connecting at Greenbush each way with the trains to and from Boston and intermediate places, leaving Greenbush daily at 1½ p.m. and 6 p.m., or on arrival of the trains from Boston; leave Troy at 7½ a.m. and 4½ p.m., or to connect with trains to Boston.

Trains also run hourly on this road between Troy and Albany. Running time between Greenbush and Troy, 15 minutes.

**TROY AND SCHENECTADY RAILROAD.** This road is laid its entire length with the heaviest H rail— which is not the fact with the road from Albany. Trains will always be run on this road connecting each way, to and from Buffalo and intermediate places. Leave Troy for Buffalo at 7½ a.m. and 1 p.m. and 6½ p.m., or to connect with the trains for the west; leave Schenectady at 2½ a.m., 8½ a.m., 1 p.m. and 3½ p.m., or on arrival of the trains from Buffalo and intermediate places.

**TROY AND SARATOGA RAILROAD.**  
THE ONLY DIRECT ROUTE.

No change of passenger, baggage or other cars on this route. Cars leave Troy for Ballston, Saratoga Springs, Lake George and White Hall at 7½ a.m., (arriving one hour in advance of the train from Albany,) and at 3½ p.m. Returning, leave Saratoga at 9 a.m. and 3½ p.m., (reaching Troy in time for the evening boats to New York.) Cars also leave Troy for the Burrough at 3½ p.m. and 7 p.m., connecting with packet boats for the north. This takes passengers from New York and Boston to Montreal in 44 hours.

N.B. Travellers will find the routes through Troy most convenient and economical, and as expeditious as any other. The steamboats to and from New York land within a few steps of the railroad office, and passengers are taken up and landed by the different railroad lines at the doors of principal hotels, thus saving all necessity for, and annoyance from, hack drivers, cabmen, runners, etc.

Aug. 3, 1846.

1y 32

**BALTIMORE AND OHIO RAILROAD.**  
MAIN STEM. The Train carrying the Great Western Mail leaves Bal-

timore every morning at 7½ and Cumberland at 8 o'clock, passing Ellicott's Mills, Frederick, Harpers Ferry, Martinsburgh and Hancock, connecting daily each way with the Washington Trains at the Relay House seven miles from Baltimore, with the Winchester Trains at Harpers Ferry—with the various railroad and steamboat lines between Baltimore and Philadelphia and with the lines of Post Coaches between Cumberland and Wheeling and the fine Steamboats on the Monongahela Slack Water between Brownsville and Pittsburgh. Time of arrival at both Cumberland and Baltimore 5½ P. M. Fare between those points \$7, and 4 cents per mile for less distances. Fare through to Wheeling \$11 and time about 36 hours, to Pittsburgh \$10, and time about 32 hours. Through tickets from Philadelphia to Wheeling \$13, to Pittsburgh \$12. Extra train daily except Sundays from Baltimore to Frederick at 4 P. M., and from Frederick to Baltimore at 8 A. M.

**WASHINGTON BRANCH.**

Daily trains at 9 A. M. and 5 P. M. and 12½ at night from Baltimore and at 6 A. M. and 5½ P. M. from Washington, connecting daily with the lines North, South and West, at Baltimore, Washington and the Relay house. Fare \$1 60 through between Baltimore and Washington, in either direction, 4 cents per mile for intermediate distances. 13y1

**MANUFACTURE OF PATENT WIRE**  
Rope and Cables for Inclined Planes, Standing Ship Rigging, Mines, Cranes, Tillers, etc., by JOHN A. ROEBLING, Civil Engineer, Pittsburgh, Pa.

These Ropes are in successful operation on the planes of the Portage Railroad in Pennsylvania, on the Public Ships, on Ferries and in Mines. The first rope put upon Plane No. 3, Portage Railroad, has now run 4 seasons, and is still in good condition. 2v19 1y

**NEW RAILROAD ROUTE FROM BUFFALO TO CINCINNATI.**

Passengers destined for

Columbus and Cincinnati, U. Louisville, Ky., St. Louis, Mo., Memphis, Tenn., Vicksburg, Natches, New Orleans, and all intermediate ports, will find a new, and the most expeditious and comfortable Route, by taking Steamboats at Buffalo, landing at Sandusky City, Ohio, distance..... 30 miles.

From thence by Cars, over the Mansfield Railroad which is new and just opened [laid with heavy iron,] to Mansfield, distance..... 56 " Thence by Stage via Columbus to Xenia over gravel and Macadamized Road, (the best in the state,) in new coaches, distance..... 88 " Thence, over the Little Miami Railroad, from Xenia to Cincinnati, distance.... 65 "

**TIME.**

From Buffalo to Sandusky..... 24 hours.  
Leave Sandusky 5 a.m. to Columbus.... 14 "  
From Columbus to Cincinnati..... 13 "  
Or say 30 hours from Sandusky to Cincinnati over this route, including delays.

**FARE.**

From Buffalo to Sandusky, Cabin..... \$6 00  
" " " Steerage..... 3 00  
" Sandusky to Columbus..... 4 50  
" " through to Cincinnati..... 8 00

Passengers should not omit to pay their fare through from Sandusky City to Cincinnati and take receipts availing themselves of the benefit of a contract existing between the said Railroad and Stage Co's, securing 121 miles travel by good Railroad and 88 miles by Stage, in crossing from Lake Erie to the Ohio river, in the space of 30 hours.

Passengers destined for St. Louis, or any point below on the Mississippi, will save by taking this route, from 4 to 6 days time and travel, and nearly half the expense, over the Chicago and Peoria route to the above places.

Fare by this route, although the cheapest, will in a short time be reduced, Railroad lengthened, and speed increased.

B. HIGGINSON, Sup't, etc.  
M. & S. C. R. R. Co.

Sandusky City, Ohio.

**NEW YORK & HARLEM RAILROAD CO.—Winter Arrangement.**

On and after Monday, November 23, 1846, the cars will run as follows:

Leave 27th street for 42d street, Deaf and Dumb Institute, Yorkville, Harlem Morrianna, and Williams' Bridge, at 7 o'clock a.m. From City Hall for above named places, 2 p.m. [freight train,] 2 30 p.m. 5 p.m. to Morrisania only.

Leave City Hall for Harlem, Morrisania, Fordham and Williams' Bridge, at 7 45 a.m., and 10 45 a.m.; 1 15 p.m., 2 p.m. [freight train,] 2 30 p.m. and 3 45 p.m.

Leave City Hall for Hunt's Bridge, Bronx, Tuckahoe, Hart's Corners White Plains, Davis' Brook, Unionville and Pleasantville, [Pleasantville 4 miles from Sing Sing,] 7 45 and 10 45 a.m.; 1 15 p.m., 2 p.m. [freight train,] and 3 45 p.m.

**RETURNING.**

Leave Pleasantville, at 8, 10, [freight train,] and 11 a.m.; 1 30, and 4 p.m.

Leave White Plains, at 8 12, 10 30, [freight train] and 11 20 a.m.; 1 50, and 4 30, p.m.

Leave Tuckahoe, 8 35, 10 55, [freight train,] and 11 35, a.m.; 2 05, and 4 35, p.m.

Leave Williams' Bridge at 7 45, 8 50 and 11 50 a.m.; 2 50, 4, and 4 50 p.m.

Leave Morrisania 8 and 9 05 a.m.; 12 05, 2 35, 4 20, 5 05 and 6 p.m.

Leave Yorkville, at 8 12 a.m.; 4 35 and 6 15 p.m.

**SUNDAY ARRANGEMENTS.**

Leave City Hall for Pleasantville and intermediate places, at 7 45 a.m.; 1 15 and 3 p.m.

Leave Pleasantville for City Hall, at 8 a.m.; 11, and 3 15 p.m.

Leave City Hall for Williams' Bridge and intermediate places, 10 45 a.m.; 2 30 p.m.

Leave Williams' Bridge for City Hall, at 8 50 and 11 50 a.m.; 1, 3 45 and 4 05 p.m. 1y49

**BALTIMORE AND SUSQUEHANNA Railroad.—Reduction of Fare. Morning and Afternoon Trains between Balt-**

more and York.—The Passenger trains run daily, except Sunday, as follows:  
Leaves Baltimore at..... 9 a.m. and 3½ p.m.  
Arrives at..... 9 a.m. and 6½ p.m.  
Leaves York at..... 5 a.m. and 3 p.m.

**Baltimore and Ohio Railroad.****Twentieth Annual Report of the President and Directors to the Stockholders of the Baltimore and Ohio Railroad Company.**

In submitting to the stockholders the twentieth annual report, the President and Directors of the Baltimore and Ohio railroad company have it in their power to state that the President, having returned to the United States, has resumed his duties at the head of the company. Returning to his post only at the close of the year, however, it has been thought best that the general operations of the company should be stated by the president pro tempore, by whom they were conducted: and for that purpose the board refer to his letter addressed to the president, and dated the 7th of the present month.

The affairs of the company are accurately exhibited in the following and annexed statements.

The statement A presents the state of the company's affairs on the 30th ultimo; and the revenue and expenses of the Main Stem for the year ending on the same day, are shown by the statement B.

The tabular statement marked C, prepared by the engineer of machinery and repairs, presents in detail the operations of the main stem, and the actual expenses of working that part of the road during the year: together with the amount of receipts from all sources during the same period. And, in order that the series of these statements should be made complete, a similar statement in regard to the main stem during the year ending the 30th Sept., 1845, and omitted in the report of that year is here supplied, marked D.

These statements show a steady increase in the transportation, both of passengers and burthen. It will be observed that the increase in the number, and in the revenue from the conveyance of passengers in the year just closed, compared with the preceding, has been more than 14 per cent. During the same period the augmentation in the amount of tonnage transported, has been more than 30, and the increase in the revenue from the same source, as compared with the receipts of the preceding year, has exceeded 26 per cent. It will also appear from the comparative statements accompanying this report, that the cost of working the road has not been greater, in proportion to the work done, than during the preceding year.

It will be seen that the net revenue, including the receipts of the coal trade, after deducting the expenses of working and keeping the road in repair, amount to the sum of \$440,475 34—being \$65,713 60 greater than the previous year, and more than 6 per cent. upon the capital of the company. Of this sum, however, besides \$65,749 64 (being principal, interest and premium in sterling bills) on account of the debt due the Messrs. Baring, there have been applied during the year to the reconstruction of the road and to the construction of burthen cars adapted to the general trade: to improvements at the depots and to right of way: to the purchase of locomotive engines and the construction of water stations: to the purchase of addi-

tion power and machinery for the accommodation of an increasing coal trade, and on account of a subscription on behalf of the company to the capital stock of the Pittsburg and Connellsville railroad, the further sum of \$284,184 76, making together \$349,934 40—and leaving of the net revenue of the year at the disposal of the board the sum of \$90,540 94—or about 1½ per cent.

The motives which justified the board in determining upon the reconstruction of the road, under the circumstances, are stated in the letter of the president pro tempore. The board could not doubt their sufficiency, and they were believed to be too urgent to admit of delay. The board at the same time determined to raise the means for the reconstruction of the entire length of the road between Harper's Ferry and Baltimore by the sale of the company's six per cent. bonds, payable in 20 years; and believing that a sufficient sum for this purpose might in this way be raised in season to meet their engagements, they directed 30 miles of the road to be immediately put under contract. The contracts were accordingly made, and the work embraced in them will cost not less than \$360,800—and may be expected to be completed before the first day of March next.

The sale of the company's bonds, however, was not effected according to the expectation of the board; and, to meet the payments under the contract, it became necessary to sell the bonds at a sacrifice varying from 8 to 10 per cent., or temporarily to apply the revenue of the year, to be hereafter reimbursed from future loans. The board thought they best consulted the interests of the stockholders, in adopting the latter alternative.

It would seem also that the time had now arrived when the board should make some definite arrangement for the reimbursement to the stockholders of the moneys taken from the annual revenue and applied to the purchase of the power and machinery on account of the transportation of coal.

The coal trade, in its origin, was, in some degree, experimental and intended, for the most part, to be confined to special contracts, comprehending large amounts, to be conducted with particular regularity and at times different from the general miscellaneous business. It was intended, therefore, to embrace this particular branch of transportation in a distinct account, and by charging it only with the capital actually employed and the expense of conducting it, apart from other transportation—to be able to trace with greater certainty the results of the trade, and the extent to which it might hereafter be advantageously carried on. These objects were stated in the answers of the board to the inquiries of the legislature in 1844; and in the annual report of the same year, the board acquainted the stockholders that for the purpose of successfully conducting this trade they had borrowed the capital from the revenue, and of their intention to reimburse it from the profits of the trade. The capacity to transport coal, however, at cheap rates and at a good profit, it appears has been practically ascertained; the trade itself, in conse-

quence of the operations at the mines and the nature of the demand, has already extended beyond the limits of special, defined contracts, and there is neither any necessity nor advantage in continuing the separation of this from the other branches of transportation. The determination recently made of reconstructing the entire road between Harper's Ferry and Baltimore from the general funds of the company superadds another reason why the expenditures on account of the transportation of coal hereafter should be placed upon the same footing as all others incurred on account of the miscellaneous trade of the road.

Under these circumstances, the board deem it only reasonable now to return to the stockholders what has been taken from the revenue during the past year, for the purposes of the coal trade; and for its conduct in future, to rely upon the same provision as is usually made for transportation of any other description.

Upon this principle, adding the sums applied from the revenue for the reconstruction of the road and for the power and machinery for the coal trade (after deducting the sum of \$43,312 14, with which that trade has been credited,) amounting together to \$146,816 05, to the residue of the surplus as above stated, there would remain a net surplus of revenue over and above all other expenditures, of \$237,356 90.

As a distribution of this amount among the stockholders could only be effected by a sale of the company's bonds at the depreciation already stated, or by the delivery of the bonds at their par value to the stockholders, it became necessary to decide, not only the alternative thus presented, but the expediency of dividing only the balance of revenue actually in hand, amounting, as already shown, to about 1½ per cent.

In considering these questions, the board has reason to believe that, with a knowledge of the general increase in the trade and revenues of the company, if not on other grounds, the stockholders generally, including the state and city, had been led to expect a dividend of at least three per cent., and it was officially represented that the authorities of the city, relying upon that expectation, had omitted to make any other than a correspondent provision for the accruing interest upon the city debt.

Yielding the fullest force to these considerations, it was at the same time, deemed inexpedient to reimburse the amount applied from the revenue to the objects stated, by a sale of the company's bonds at so great a depreciation, and at rates which might have a tendency to impair their value in future, at least until an opportunity could be afforded of adopting reasonable means calculated to establish their just and full value.

Up to this time the amount of bonds which the company proposed to issue, and the specific pledge by which it was designed to secure the payment of both principal and interest, had not been limited or defined, and this had a tendency to depreciate their price. The bonds, when issued, moreover, and in the

hands of citizens of Baltimore, are actually subjected to a tax by the state and city, amounting together to nearly one per cent.; an impression also generally prevails, that they would be liable to the same tax in the hands of citizens of other states, and it is certain it would be competent for the authorities, either of the state or city, not only to create this liability, but to increase the tax according to the exigencies of either. These causes combined, have hitherto effectually prevented the sale of the bonds, unless at a sacrifice which the board did not feel authorized to incur without every effort in its power to avoid.

The first difficulty the board have already removed, by executing and directing to be recorded a mortgage of the property, effects and revenue of the company, second only to the mortgage already existing for the security of the million loan, on account of the Washington road, and by limiting the amount included in the mortgage to \$1,000,000, and the application of that amount to the reconstruction of the road, and the reimbursement of \$58,192 64 applied during the past year to the increase of power and machinery for the coal trade.

That this measure alone will add to their value, and render the bonds more saleable, is not to be doubted; and that their exemption from tax by the state and city, would establish them at par, and perhaps enable them to be sold at a premium, is believed to be equally clear.

The cheapening of the cost of transportation, the diminution in the expenses of working and repairs, and the consequent increase of the net revenue resulting from the reconstruction of the road, would, under any circumstances, be considered as much more than an equivalent to the city or the state for the loss of any revenue they could hope to derive from a tax upon the company's bonds.

It is, however, only proper to remark, that not only the contracts already made in regard to the 30 miles of the road, but the early reconstruction of the entire line between Baltimore and Harper's Ferry, is not a matter of discretion, but of necessity, to be accomplished in no other way, and by no other means, than the use of the annual revenue, or by the sale of the company's bonds at the best prices that may be obtained. In this view, that an exemption of the bonds, not exceeding \$1,000,000, from taxation by the State and city, would be preferable to the sacrifice of a depreciated sale, or the loss of an annual dividend until the present engagements can be complied with, and the reconstruction of the road completed, it is supposed will not be questioned by any one.

After fully weighing the foregoing considerations, the board have felt it their duty not to incur the responsibility of producing either of the losses, or any of the inconveniences already pointed out.

They have determined, therefore, to reimburse so much of the revenue of the year as has been applied to the coal trade and to the reconstruction of the road, by the issue of the six per cent. bonds secured by the mortgage already recorded, and in preference to a sacri-

fice of the bonds in the market at the present prices, to pay them to the stockholders, to be used as they may deem proper.

Pursuant to these views the Board having applied \$20,000 to the sinking fund on account of the loan for the Washington road according to the pledge contained in the annual report of 1842, have declared a dividend of 3 per cent., or \$3 per share, payable as follows, that is to say: to all stockholders owning on the first day of the present month less than 50 shares of stock, \$3 in money on each share on and after the 20th day of November next; and to all stockholders owning on the said first day of the present month 50 shares and over one dollar on each share in money, and two dollars in the bonds of the company, bearing six per cent interest payable quarterly, and reimbursable in 20 years; the money to be paid and the bonds to be delivered on or after the said 20 day of November next.

By this measure all the stockholders will receive back in undoubted securities the full amount borrowed from the revenue and applied to purposes of capital; and to those who may desire to invest their dividends, an advantageous opportunity of doing so is thereby afforded. It is hoped and believed that the partial payment of money will render it unnecessary for any to dispose of the bonds until further measures can be adopted to increase their value; and to the State and city especially, ample opportunity will be afforded, by authorizing a just exemption of the bonds from taxation, not only to raise to their full value those now to be paid on account of the dividend, but to ensure the reception of an annual dividend of the profits of the road in future.

While announcing these measures, however, the Board deem it not less due to the stockholders, than an act of justice to those to be in future associated in the management of the company, to point the attention of the stockholders to the actual and probable state of the company's affairs, during and at the termination of the year commencing with the first of the present month.

The board, therefore, proceed to state that, on account of the contracts for the reconstruction of the 30 miles of road, already explained, there will remain to be paid before the 1st of March next, not less than \$225,000—on account of new locomotive engines constructing under contracts executed in the months of April and May last, and payable during the same period \$70,000; for new burthen cars now under construction, \$20,000, and for improvements at the several depots, \$10,000.

To these must be added the interest upon the bonds now directed to be delivered to the stockholders, and upon such temporary loans as it may be necessary to make in anticipation of the revenue, and also the instalment payable during the year to Messrs. Baring, Brothers & Co., of London, estimated together at \$93,000—and forming an aggregate of existing engagements of not less than \$418,000.

It will be perceived, therefore, that independent of contingent expenses, such as rare-

ly fail to occur in the course of 12 months' operations, the revenue of the current year, if it should equal that of the past, will be absorbed by debts already incurred; and consequently, that without disposing of the company's bonds to meet the contracts for reconstruction, it will not be in the power of the board to make any dividend at the end of the year.

It is also to be observed, that an amount of not less than \$335,000, arising out of those existing engagements, must be paid before the 1st of March next, and not improbably obliging the board to dispose of a considerable amount of their bonds without regard to the state of the market; in which case it would be necessary to add the loss sustained by a depreciated sale, to the other charges upon the revenue of the year, as already explained.

It is proper, also, in this place to state, that during the last session of the Pennsylvania Legislature, a law was obtained authorizing the construction of a railroad from Pittsburg to some point on the Maryland line, where it might be united with the Baltimore and Ohio railroad; and, in the expectation that it might thereby become an important lateral connection of their road with the Ohio river, the board, in the month of May last, authorized a subscription to be made on behalf of this company for 700 shares, costing at the par value, \$35,000, in case such amount should be found necessary to secure the charter of the Pennsylvania company. Seven hundred shares were accordingly subscribed under the authority so given; and the first instalment, amounting to \$1,750, was paid out of the revenue of the Baltimore and Ohio railroad company.

It is now understood that the Pittsburg and Connellsville railroad are desirous of progressing with their road with the least possible delay, and that they are not without expectations of further and greater assistance from this company. Whatever may be the result of these expectations, it is certain that a compliance with the subscription already made, will be insisted upon, and the extent to which this company may be called upon for payment, will be an addition to the obligations, already explained, to be discharged from such resources as may be in its power.

It would seem, therefore, that without a considerable increase in the business of the road, or a like diminution in the expense of working it, and unless the board should be enabled to dispose of the bonds, proposed to be issued at fair prices, it is not only probable, but certain, that there can be no dividend at the end of the current year, but that the net profits, and consequently the dividend, of the year ending September 30th, 1848, will be materially diminished.

#### SECOND.—Of the Washington Road.

The affairs of the Washington road are shown by the statements E. and F.

These statements show an improvement in the revenue during the last half year, as compared with the preceding six months.

The net profits, including the surplus of \$6,888 31 after the dividend in April last, amount to the sum of \$80,576 70, of which

the board have declared a dividend among the stockholders of three dollars upon each share of stock for the last six months, payable on and after the 15th day of the present month, and leaving a surplus of \$11,076 70, to be carried to the account of the current year.

**THIRD.—Of the further prosecution of the Road to the Ohio River.**

Important as a judicious and economical management of the existing work may be, and necessary as it undoubtedly is, by all the means at their command to develop and extend its present resources, the board continue to regard the early prosecution and final completion of the road to the western waters, as their great and ultimate duty.

Considered in reference to the magnitude of the enterprise, or to the effects which may be expected from its judicious location and successful completion, the Baltimore and Ohio railroad is inferior to no work of internal improvement in this or any other country. That a short and cheap route between the States of the middle and southern valleys of the Ohio and Mississippi, and the Atlantic markets may be found by a line from Baltimore to more than one point on the Ohio river, it is not to be doubted; and, it is equally clear, that the route to which a preference is ultimately to be given, must be in a degree, determined by its connections with the western country.

The line which will be most desirable and afford the greatest facilities to the largest portion of the population of the Ohio and Mississippi valleys, and maintain the most successful competition with rival works seeking the same object, ought to be preferred by all; and, in this view, important as the work may be to Baltimore, it is not likely to be estimated less by all the States on the Ohio and Mississippi valleys. By consulting the interests of those States, their co-operation may be reasonably invoked, and time and the developments constantly in progress may be expected at no remote day to triumph over all the obstacles which have hitherto retarded the enterprise.

The recent legislation of Pennsylvania, referred to in another part of this report, if used with proper skill and energy by those in charge of the work it authorizes, may ensure to the company, independent of all other legislation, the opportunity of connecting their work with the western States, if not at the best, certainly at a point possessing great advantages; and if it be not allowed to defeat the prosecution of the Baltimore and Ohio railroad to its legitimate termination at a more southern point on the Ohio, will deserve and ought to receive every reasonable encouragement from this company and from the people of Baltimore. The board, at the same time, without meaning to underrate the importance of the railroad from Pittsburg to the Maryland line, are unwilling to lose sight of the expectation that by means of the legislation of the State of Virginia, they may be enabled to prosecute the main stem of their road to some eligible point on the Ohio river within that State.

It is not probable that the just claims of the people of the northwestern and southwestern counties will be much longer neglected by the enlightened councils of that great Commonwealth; and it is not unreasonable to expect that other interests, heretofore more partial to other improvements, will, at no distant day, be brought to look upon the Baltimore and Ohio railroad as the most practicable means of developing the resources of those parts of the State which have hitherto depended upon other means.

The proceedings of a numerous convention of delegates from the northwestern counties of the State of Virginia, recently held at Weston, Lewis county, would appear to encourage these expectations, and to warrant the hope that so much intelligence and perseverance cannot fail ultimately to succeed.

Nor do the board deem it unreasonable, at a period when the utmost exertions are every where making to unfetter the trade and facilitate the intercourse between different communities, to count upon the cordial co-operation of the western States, and of the most distant parts of the Union, in support of an enterprise affording to all the easiest access to the best markets.

To no portion of the United States are works of internal improvement of greater importance, than to the States south and east of the Ohio river; and, it is not to be supposed that the people of those States will long remain insensible to this truth. Already the introduction of steam upon the western waters, has accelerated the advance of that immense region beyond that of older parts of the Union, and little remains to complete their prosperity than such means of intercommunication with the Atlantic States as, with the application of steam upon their great rivers, will unite the employment of the same power upon land.

It will be the duty of the board, therefore, to appeal to those interests, and by all means in their power, endeavor to render them auxiliary to the prosecution of the great work they have in charge.

By order of the board.

LOUIS McLANE, *President.*

Baltimore, October 12, 1846.

BALTIMORE, October 7th, 1846.

Hon. LOUIS McLANE, *President Baltimore and Ohio Railroad Company:*

DEAR SIR—In compliance with your request, I have the honor to submit a general statement of the operations of the Baltimore and Ohio railroad during the past year.

By reference to the reports of the superintendents of transportation and machinery, it will be seen that there have been transported to and from the several points on the main stem, 193,916 tons of merchandize, and 280,264 passengers, showing the very remarkable increase in the former of 52,509 tons, and in the latter, of 77,806 passengers over the year previous. This increase in the tonnage, it will be observed, has occurred, upon the most part, in the transportation of miscellaneous trade, and is the more gratifying because it gives evidence of the importance at-

tached to this route as an avenue of communication with the west, even in its present unfinished condition; and, connecting as it does, with a most imperfect mode of transportation between Cumberland and the Ohio river.

The increase above alluded to, occurred chiefly between the months of September and May last. The great drought of the summer of 1845, having rendered the Pennsylvania canals very inefficient during the autumn, and the violent effects of the breaking up of the last winter causing them to be almost entirely useless until a late period of the spring.

This large amount of trade thrown thus suddenly upon the road, although extremely gratifying in many respects, produced considerable embarrassment on account of the inadequacy of the motive power and cars for its accommodation. To such an extent, indeed, at one period, did this embarrassment exist, that for a short time it was found absolutely indispensable to refuse to receive merchandize for transportation, the depot being crowded to its full capacity, and the forwarding houses at Cumberland being unable to procure wagons in sufficient numbers for its prompt dispatch.

It will be readily perceived, that in the effort to accommodate such a trade, both the locomotives and cars were pushed to their utmost capacity, and indeed beyond what would, under other circumstances, have been considered consistent with a proper economy in regard to repairs. It not unfrequently happened that the engines, after performing their duty during the day, had necessarily to be repaired after night, in order that they might be ready for use the next morning—a system altogether too expensive, and too imperfect to be allowed, except under such circumstances as then existed. But, under this state of affairs, it became the duty of the board to endeavor to procure, at as early a day as possible, an increase of power and cars; and they accordingly directed the committee of transportation and machinery, by resolutions of the 3d December, 1845, March 11, 1846, April 8, 1846, and June 10, 1846, to procure six locomotives of the largest class, and three of the second class; and also to cause to be constructed in the company's shops, one locomotive of the largest class, and one of the 2d class; 30 iron coal cars, 20 house cars, 42 gondola cars, and 20 stock cars.

The board, under a report and resolution of the committee of transportation and machinery, on the 8th July last, have further authorized, in view of the probable increase of the trade during the year 1847, contracts to be made for five first class engines, and 30 merchandize cars. This last authority has not, up to the present moment, been acted upon, except in regard to the merchandize cars, which are now in course of construction. Whether the increase in the coal trade will be such as will render the five locomotives, above referred to, necessary, remains to be ascertained, and may depend upon the course the company may take in regard to that subject. Only three of the engines above refer-

red to, have been delivered. One of the engines ordered to be built in the company's shops, is in a state of forwardness, and those contracted for, will be delivered in the course of this year. Nearly all the cars ordered have been completed, and are in use upon the road. This large increase of machinery and cars, rendered further accommodation for their protection at the Mount Clare and Cumberland depots, indispensable; and, under the recommendation of the engineer of machinery and repairs, the board authorized the extension and erection of the buildings and other improvements at those points, under resolutions of the 11th March, and 13th May last. These circumstances, it is believed, will sufficiently explain the increase during the year, of expenditure in the repairs of locomotives, the cost of new machinery, and of expenditures upon depots and water stations.

The quantity of coal brought to market over the road during the year, amounts to 18,393 tons, being 2,373 tons more than that of last year. It must be observed, however, that of this quantity, 12,682 tons have been transported since May last, that being about the period when several of the coal companies in Allegheny county commenced their operations. The contract with the N. York and Maryland Iron and Coal company, to which reference has been had in former reports, having been abrogated, and that company having devoted its capital and energies to the manufacture of iron, the quantity of coal received from them during the year has been very inconsiderable.

The augmentation of the trade, and the occurrence of accidents almost daily, which involved serious derangement of the machinery, and in some instances the loss of life to persons engaged upon the trains, necessarily had the effect of calling the attention of the board to the condition of the road, and accordingly on the 8th of October, 1845, a resolution was adopted directing the chief engineer to take into consideration and to report to the board, a system for the gradual extension and improvement of the road from Harper's Ferry towards Baltimore.

Upon this resolution the chief engineer made an elaborate report, in which it was satisfactorily shown that the condition of the road was such as to require its reconstruction. The comparative merits of the plate rail, in point of repairs and renewals of track, repairs and renewals of machinery, and expenses upon the motive power, are fully discussed, and the advantages are shown to be most decidedly in favor of the edge rail.

The following table, extracted from the chief engineer's report, will exhibit, at one view, the cost of construction, and the relative expense of maintaining the two descriptions of track under different amounts of trade: it will appear that if, instead of 92 miles of plate rail, we had an equal number of miles of edge rails, the saving under the probable trade of the present year of 116,522 tons would have amounted to \$18,308, and under the 151,522 tons of the coming year to \$30,173, in the maintenance of way alone. From these sums there should, however, be deducted the

annual interest upon that part of the capital in the present plate rail track, which would be sunk by the substitution of the new track. Of the \$3,500 per mile, the estimated cost of the former, about \$1,500 would be realized by the sale or use of its materials, leaving \$2,000 per mile, on which the interest at six per cent is \$120 per annum per mile, and for 92 miles \$11,040, which, taken from \$18,308, and from \$30,173, leaves \$7,268 as the saving for 1846, and \$19,136 for that of 1847.

DIFFERENCE. In favor of Plate Rail, Against Plate rail.	DESCRIPTION OF TRACK.	Estimated cost of construction per mile.	Interest at 6 per cent. on cost, per mile.	Interest at 6 per cent. on cost, of 92 miles.	Repairs and Renewals, per mile.	Same for 92 miles.	Interest, Repairs and Renewals for 92 miles.	Capital equivalent to the latter, at 6 per cent.	Repairs and Renewals per mile.	Same for 92 miles.	Interest, Repairs and Renewals for 92 miles.	Capital equivalent to the latter, at 6 per cent.	Repairs and Renewals per mile.	Same for 92 miles.	Interest, Repairs and Renewals for 92 miles.	Capital equivalent thereto at 6 per cent.
7,060	Plate Rail.....	3,500	210	19,320	653	60,076	79,386	393,965	1,019	93,748	113,068	1,884,466	1,201	110,492	129,812	1,653,533
491	Edge Rail.....	10,660	634	58,328	288	26,496	84,824	1,413,400	396	36,432	94,760	1,579,332	449	41,308	99,636	1,660,600
39,005																
365																
33,530																
5,459																
90,124																
623																
67,316																
18,308																
305,132																
622																
69,184																
30,176																
502,933																

These results are founded upon estimates of the average wear and tear of the two tracks for a series of years under the respective amounts of trade assumed. But, in fact, while the plate rail track, if continued, would certainly cost the sums set down to it during this year and the next, the edge rail track, if now laid down and ready for use, would, for those two years, cost very much less than the amounts assigned to it. Indeed, considering the perfect consolidated character of the road bed upon which it would be placed, it is be-

lieved that for the first year it could be maintained in repair for 125 dollars per mile, and for the second year for 195 dollars per mile.

In confirmation of this supposition, and in support of the above estimate of the repairs and renewals of an edge rail track like that west of Harper's Ferry, under the several amounts of trade assumed, may be adduced the fact that the  $\Pi$  rail track, of which there are 19 miles east of Harper's Ferry, has cost an average of about 210 dollars per annum per mile to maintain it since it was laid down, seven years ago, and the  $\Omega$  rail track west of Harper's Ferry has cost, for the 3 years of its duration, about 190 dollars per mile. The maintenance of the  $\Pi$  rail track of the Washington branch has, in nine years experience, cost about 275 dollars per annum. The saving of the edge, compared with the plate rail, would then, for the first year, be 32,200 dollars, instead of 7,268 dollars, and for the second year, 44,344 dollars, instead of 19,136 dollars, as just stated.

From the preceding comparison, founded, it is firmly believed, upon the safest and most satisfactory data, furnished by the ample experience of our own road, and substantiated by that of other works, we are authorized to draw the conclusion that, if at this date, we had a new edge rail track instead of the old plate rail track east of Harper's Ferry, we should have saved not less than 32,000 dollars, during the past year, in the cost of its maintenance, under the estimated trade of this year.\*

Again, the following table, extracted from the same report, will show the probable reductions in the cost of working the road between Baltimore and Harper's Ferry, due to the substitution of an edge rail for the present plate rail between those points.

From the summary of the savings under the four heads of expenditure, considered, it is seen that, with an edge rail, the company would have saved in the operation of the last seven years, the sum of 15,470 dollars; and that with such a rail, they would have saved in the working of the road during the past year, 49,071 dollars; and, in that of the year following, 63,233 dollars, after allowing six per cent. interest on the cost of the new track. And if interest at the rate of 120 dollars per mile be allowed upon the sunken capital of the old track, if it were now abandoned, the saving would then have been for the present year, 38,031 and for the next, 57,193 dollars, clear of all drawbacks whatever.

And if we look no further in estimating the repairs of the new track than two years ahead, the saving would be 62,963 dollars for the first, and 82,401 dollars for the second.

This, then, is the result of the balance of "advantages and disadvantages," so far as they are susceptible of being estimated in money, upon principles and data which are demonstrably true.

\* It is proper to observe, that the report of the chief engineer was made in November last, and assumed that the trade of 1846 would amount to 116,522 tons, averaged over the entire length of the road between Baltimore and Harper's Ferry. The result of the year's business shows his estimate to be not far from the truth.

TABLE OF THE COST  
Of Constructing and Maintaining the two kinds of Track under the various amounts of Trade.

DESCRIPTION OF TRACK.	Seven years preceding Oct. 1, 1945.		Year ending October 1, 1946.		Year ending October 1, 1947.	
	Trade of 63,652 tons.		Trade of 157,731 tons.		Trade of 203,109 tons.	
Repairs and Renewals of track, including interest.	\$ 79,396	\$ 49,099	\$ 113,068	\$ 68,992	\$ 129,912	\$ 103,396
Repairs and Renewals of Machinery.	\$ 84,894	\$ 42,080	\$ 73,553	\$ 51,274	\$ 99,636	\$ 88,682
Motive power expenses.	\$ 54,239	\$ 40,630	\$ 68,372	\$ 7,680	\$ 975,042	\$ 66,371
Interest on capital invested in burthen cars.	\$ 1,350	\$ 1,350	\$ 7,680	\$ 7,680	\$ 9,000	\$ 339,576
TOTALS.	\$ 184,354	\$ 183,864	\$ 252,593	\$ 127,916	\$ 1,401,560	\$ 599,025

Under these circumstances the board being deeply impressed with the necessity that the road should be repaired in the most substantial manner, on the 5th of January last, in conformity with the report of the Committee of Finance, passed the following resolution :

**"Resolved, That it is expedient that all contracts necessary to the immediate reconstruction of 30 miles of the road be made without delay."**

In conformity with this resolution contracts were entered into with the New York and Maryland Mining company, for a supply of iron and the whole line of the road to the extent of 30 miles was put immediately under reconstruction.

About one-fourth of this distance has been completed, and it is confidently expected that

the remainder will be ready for use before the 1st of January next.

In entering upon a work requiring so large an expenditure, the board of directors calculated upon raising the necessary means by a sale of the company's bonds to the extent of \$1,000,000—and they accordingly authorized bonds to be issued to that extent. Efforts were made both in this country and Europe to that effect, but so far without much success. It is hoped however, that the measures which have recently been adopted by the board will have the effect of placing the bonds upon very high ground as an investment, and of insuring for them a ready sale in the course of the coming year.

The number of passengers carried over the Washington road during the year was 157,156, showing an increase over the year previous of 53,568, and the statement of the revenue shows an increase of \$21,851 50 for the same period.

It is true that a large portion of this increase is due to the great number of passengers which pass over the road during the continuance of the national fair held at Washington city in the month of May last—but a comparison of the receipts from the road independently of this consideration, since the period of the reduction of fare in the month of September, 1845, will show a manifest and decided increase over the corresponding period when the high rates were charged, and the competition with the stages existed.

The condition of the tracks upon this road is entirely satisfactory—the cost for repairs is comparatively light, and the trains proceed without embarrassment, and with but little interruption.

During last winter the citizens both of Virginia and Pennsylvania, feeling a deep interest in the extension of the road to the Ohio river through these States, made earnest appeals to their respective legislatures for the right of way.

In Virginia the effort resulted in nothing more than some slight modifications of the law passed at the previous session, but retaining the most objectionable features in full force.

In Pennsylvania a law passed authorizing the company to pass through that State, which is exceedingly embarrassing in many of its provisions, and moreover is made to be dependent for its vitality upon the failure on the part of the citizens of Philadelphia to subscribe the sum of \$3,000,000 to a company incorporated at the same session to construct a road from that city to Pittsburgh. To what extent that subscription has been made I am not informed, but even if it should fail to the extent required, it is not believed that the law could be accepted by this company.

Authority however, was conferred upon the Pittsburg and Connellsville railroad company to extend their work to the Pennsylvania line upon any of the waters of the Youghiogeny river, and it is understood that that company is about to prosecute its work with a good degree of energy. Should it succeed in accomplishing its object to the point designated, the distance between its terminus and

that of the Baltimore and Ohio railroad at Cumberland, will be so short, as to render the connection between the two works entirely practicable.

When this is accomplished, a continuous line of railroad between Baltimore and Pittsburgh will be established, throwing open the fertile districts of Pennsylvania through which it will pass, and bring the counties bordering even upon the great lakes, to pour their tribute of commerce and wealth into the lap of our own city.

I remain, very respectfully,  
Your obedient servant,  
SAM'L JONES, JR.

OFFICE OF TRANSPORTATION,—Baltimore and Ohio Railroad Company,  
414 Ocker, 1846  
W. S. Woodruff, Superintendent.

**Gems from the Copper Region.**  
H. Pierce, Esq., one of the agents of the Montreal Mining Company, has shown to the Editor of the Montreal Pilot, a beautiful agate, set in a silver ring, manufactured at the Cliff Mine, on the south shore of Lake Superior. It is worthy of notice that the silver of this ring was got out of the Cliff Mine, the agate was picked up on the adjoining shore, and cut and manufactured on the spot. Mr. P. also exhibited an agate, from the north shore, of great size and beauty, measuring about an inch and three-quarters by an inch and a quarter. These agates are said to be in great abundance on the north shore.

Correspondents will oblige us by sending in their communications by Tuesday morning at latest.

### AMERICAN RAILROAD JOURNAL.

Published by D. E. MINOR, 105 Chestnut St., Philadelphia.

Saturday, April 3, 1847.

### MISSING NUMBERS

#### OF THE RAILROAD JOURNAL.

Subscribers, who wish to obtain Missing Numbers of Back Volumes of this Journal, will do well to apply immediately.

One or two COMPLETE SETS of the RAILROAD JOURNAL may be had in a few weeks—or as soon as two numbers can be reprinted—by application to the Editor.

#### Boston and Providence Railroad.

The Fifteenth Annual Report of this road will be found in this number. In its details it is in the prescribed form required by the Legislature. We shall continue to publish these reports, in their new form, that they may hereafter be referred to for comparison.

#### Baltimore and Ohio Railroad Report.

We give in this number—and owe an apology for having so long delayed—the “Twentieth Annual Report of the Baltimore and Ohio Railroad Co.” It was duly received, in duplicate, and should have been published before the close of the volume for 1846; but, like many other things that deserve immediate attention, was laid aside for a careful perusal, and thus thrown out of its proper place. It, however, loses nothing of its value by losing its proper position in the Journal. As usual, and indeed more than usual, it contains valuable statistics in tabular form, which will be mainly found in this or the next number.

The increase of receipts in 1846, over those of the previous year, have been greater—by \$143,084—than at any previous period, and we hazard little in saying that the increase for 1847 will be still greater.

The tabular statements, showing the comparative cost of construction, repairs and working a railroad with the plate and edge rail, prepared from the chief engineer's report, are well worthy of attention, and so are those prepared by the engineer of machinery and repairs, for the years 1845 and 1846. We give the report, including most of the tables, and wish we could add that the efforts of the company to obtain the right of way through Virginia to the Ohio had been successful.

#### New Mortising Machine.

Messrs. Davenport & Bridges, railway carmakers, of Cambridgeport, Mass., have recently put in operation a mortising machine, operated by water power, and which will cut with ease and facility a mortise of any required width and depth. The machine can be adapted equally well to light or heavy work, only requiring a stronger frame and gearing when heavy work is required, than for light. It works

equally well in hard or soft timber, requiring only one hole to be bored in the centre of the mortise, to give the chisel a chance to make the first stroke, and this is done by machinery.

#### Improvement for the Telegraph.

MR. L. SWAN, of Rochester, says the “American” of that city—suggested, several months ago, an improvement in the manner of maintaining the Galvanic Battery, which will prove of no inconsiderable benefit to the telegraph companies, inasmuch as it is a great saving of labor and expense.

The improvement consists in furnishing an exciting liquid which produces an electric or galvanic current of uniform power and intensity, without the rapid decomposition of the metals and acids heretofore supposed unavoidable. The solution does not act chemically on the mercurial amalgam, and with such trifling action on the zinc as to be scarcely perceptible.

Mr. Barnes, the operator in the telegraph office in this city, informs us that previous to adopting this improvement, he was obliged to amalgamate the zinc cups of which the battery is composed, with mercury every day, and to renew the acids twice a week. Since then he has used the battery constantly for five or six weeks, without doing either.

This improvement will doubtless attract the attention of telegraph companies throughout the country, not only on account of the reduction of expense, but also for the reason that it ensures greater uniformity in the action of the battery. It has now been sufficiently tested to remove all doubts in regard to its efficacy. The discovery is eliciting the attention of the scientific, as it is understood that some new principles are developed.

#### Pennsylvania Central Railroad.

The election held on Tuesday for the choice of Thirteen Directors of the Pennsylvania Railroad Company, resulted in favor of the ticket previously agreed upon by a majority of the Stockholders and approved by the City Councils. The following are the names of the gentlemen elected:

Thomas P. Cope,	Richard D. Wood,
S. V. Merrick,	Stephen Colwell,
Robert Toland,	George W. Carpenter,
Thomas T. Lea,	Christian E. Spangler,
David S. Brown,	William C. Corbit,
James Magee,	Henry C. Patterson,
	John A. Wright.

This, we deem an able and responsible Board of Directors—and, if they are as fortunate in the selection of their Engineers and Superintendents as we think, the Stockholders have been in selecting Directors, we anticipate an early commencement and a speedy completion of this important work.

#### New Use for the Telegraph.

A novel project is on foot in the Common Council of New York to run a Telegraph line from the fire lookout on the City Hall, to each of the 18 police stations, to give intelligence of the whereabouts of every fire, so that on hearing the great bell, a person in any part of the city can ascertain at the station house where it is.

#### Cincinnati and St. Louis.

We learn, says the Cincinnati Gazette, from St. Louis, that the Missouri Legislature have passed a bill so amending the city charter that the Councils shall have power to aid the project of a railroad between St. Louis and Cincinnati, by loan, or otherwise, to the amount of half a million of dollars.

The enterprise, however, has received the cold shoulder, in the upper branch of the Legislature of

Illinois—the bill to grant the right of way through that State, having been defeated by a vote of 24 to 15. This result is attributed in part to a determination by northern members to oppose any measure which shall not regard Springfield as a point through which such road shall pass, and in part to the opposition of the citizens of Alton, who will not listen to a proposition to terminate the road in St. Louis instead of their own city.

Public meetings, it is stated, are being held in the central counties, protesting against the action of the Senate, and urging the passage of a bill to grant the right of way on the route from St. Louis to Terra Haute direct.

#### First Principles of Chemistry for the Use of Schools and Colleges.

BY PROF. R. SILLIMAN, JR., YALE COLLEGE.

We are indebted to the publishers for a copy of this excellent text book. A scientific gentleman has recommended it to us as a good book, not only for beginners, but as well suited to the wants of professional men who are anxious to understand chemistry as it is taught at present—and this, by the way, is quite a different thing from the chemistry of by-gone years.

To the engineer and mechanic a knowledge of chemistry is every day found to be necessary. Much trouble and many errors might be avoided by one possessing the amount of information to be obtained from the work before us.

It is often the case that professional men, aware of the usefulness of the science of chemistry, have been deterred from making any attempt to study it, by the necessity of wading through treatises, excellent to be sure, but too voluminous for the beginner, and needing too much previous knowledge of the subject to be read to any advantage. The present book is not liable to these objections, and will prepare the student for more extensive works on the science, or for those special works on professional subjects, which require from the reader a general knowledge of chemistry.

#### Travelling Facilities.

“We are informed, says an exchange, that the abuse of privilege so long complained of by travellers between New York and Philadelphia, are about to be removed; that a cheap freight and passenger train is to be started from Trenton to New York, and that the accommodations on the Amboy line are to be improved.”

Very glad to hear of this! There has long been “room for improvement” upon this line, in the matter spoken of—and we shall be happy to learn that the above statement, and more too, is fact.

#### The Central Railroad.

We cut from the Savannah Georgian of the 8th ult., the subjoined article in relation to the Central railroad, in order that our readers may know what the citizens in different parts of the Union, think of the great enterprise about to be commenced by our citizens.

Another reason which induces us to publish the article is, because it speaks in high praise of a gentleman, whose communication in the United States Gazette, and in this Journal also, some time since, in relation to the Central railroad, attracted our attention and the attention of other gentlemen deeply interested in the success of the enterprise:

The citizens of Philadelphia are bestirring themselves in the great contest for the trade of the far west to some purpose. The requisite amount to entitle them to a charter having been subscribed, and the charter obtained, they are about proceeding with all prudent despatch upon the construction of this

gigantic work, which is to pour the treasures of the west into the lap of their great city. The plan proposes an extension of the road now existing—from Harrisburg across the mountains to Pittsburg—a distance of nearly 300 miles.

The *United States Gazette* some time since published an elaborate article recommending the adoption of the present line of the canal from Harrisburg to Hollidaysburg—the Portage railroad—and the Western division of the canal from Johnstown to Pittsburg, and constructing the road upon the banks of the canal.

The article attracted our attention, from the fact that the writer, Mr. Franklin P. Holcomb, was in the service of the Central railroad of this State from the commencement of the preliminary surveys, until near the completion of the work—made the surveys and final location of nearly the whole road, and afterwards superintended the construction of the heaviest and most difficult part of the work.

The fidelity and ability with which he discharged these important duties, won for him the confidence of the board of directors and their chief engineer.—We know nothing of the merits of the plans recommended by Mr. Holcomb, except from a perusal of his elaborate article, but the experience he has had, and the ability he displayed in his profession while among us would, were we called upon to decide the question, give great weight to his opinions.

That the great enterprise in question, if completed, will be the salvation of the trade of Philadelphia, we cannot entertain a doubt; and we feel not the less interest in their success for its having adopted the cognomen of our own "Central railroad."

#### Great Western (English) Railway.

The following extracts from the last semi-annual Report of the Directors of the Great Western Railway, England, exhibits its affairs in a very flourishing condition. The increase of travel is truly surprising—yet only the natural result of the extension and improvement of the system.

The amount of capital expended by this company is £8,885,605: and the dividend for the last year, 9 percent, upon the shares. The shares issued amount to £4,600,000: and the balance has been raised in the shape of loans.

"With respect to the traffic," says the report, "it may be observed, that in the corresponding period of 1845, precisely the same length of line was open and worked over by this company as in 1846, so that the comparison in the number of passengers, and the tonnage of goods, is a perfectly fair criterion of the increase conveyed over identically the same railway; and this review of the business of the company indicates more satisfactorily the features of progressive trade, when it is remembered that the excitement of 1845, with the numberless schemes and the travelling consequent thereon, is thus contrasted with the almost entire cessation of such speculative movements during the latter part of 1846. The increase in 1846 has been at the rate of 503 passengers per diem, viz: 92,598 for the half-year, with an additional trade of 23,975 tons of goods. While the accommodation of more frequent trains has been afforded, it cannot fail to be observed with satisfaction that the employment of two locomotive engines for the occasional assistance of trains has been greatly diminished in the number of miles run, as compared with the similar period in the years 1844 and 1845. This result is mainly to be ascribed to the improvements and increase of power in the locomotives, of which the broad gauge is susceptible; the importance of which, as essentially requisite for the growing demands of traffic throughout the country, is developing itself more and more, as well to the public as to the proprietors, by each day's experience. \* \* \* \* \*

"The balance now disposable being £318,856 19s. 7d., the directors recommend that a dividend of four per cent. be declared for the half-year ending the

31st of December, 1846; payable on or after the 1st of March, to the proprietors registered on the company's books, when they were closed on the 8th Feb., which dividend will amount to £211,002 4s. 9d., and leave a balance of £7,853 14s. 10d. to be carried to the credit of the next half-year's account."

#### Cincinnati and Hamilton Railroad, and Improvements in Ohio.

The following letter is given, though not designed for publication, to show the progress of improvement in the west. It is from one who has, as he says, "*been a long time with us*," and what is equally gratifying, he has *usually* been in *advance* with us—as now—for which we are deeply indebted to him.

His letter is dated, "Hamilton, Ohio, March 22," and he says: "I enclose \$5 00 to pay for the present volume of the Railroad Journal. You will oblige me by sending the 25th No. of 1846, also the 7th No. of 1847. I would have been pleased to send you a few new subscribers, but there are so few here who take an interest in such papers as the Railroad Journal, that it is difficult to find one. About the 1st of next month I shall commence the location of the Cincinnati and Hamilton railroad—a preliminary survey of which I made last fall, a year ago, before a charter was obtained. The line passes thro' the *finest portion* of Ohio—and, indeed, of the whole west—unsurpassed in fertility and water power. At this point, by the exertions of a few, one of the finest water powers west of the Allegheny mountains, has been created, capable of driving 180 mill stones of 44 feet diameter each, much of which is now occupied; and our town is fast filling up with an enterprising population. The power has cost us about \$50,000. The races, reservoirs, etc., are on a magnificent scale, and Hamilton must be, at no distant day, to Cincinnati, what Lowell is to Boston. My dear sir, you may some day wander thus far west, and should you ever do so, call and see me—one who has continued with you as a *subscriber* for a great many years—and I will take pleasure in showing you what a *little enterprise* has done; and that, too, without much means. Hamilton is delightfully located on the Great Miami river, and as yet has not created much noise in the world; but when our railroad is finished, and our water power taken up, you will then hear favorable accounts of Hamilton. The minimum discharge of the Great Miami river is 25,000 cubic feet of water per minute; the actual fall at this place 29 feet. The distance from this point to Cincinnati, by the route of our railroad, is about 23 miles; no grade greater than 25 feet per mile. We are connected with Cincinnati by a canal and two turnpike roads; the roads are constructed with broken stone and gravel, and are generally in fine order and much travelled. I left Philadelphia in 1828, and have resided in Ohio and Indiana ever since. I have often been at the point of visiting my relatives in Philadelphia, but have not yet done so—but hope to during the present year, and should I do so, I will make the "Franklin House" my head quarters. Yours respectfully, J. W. E."

The proposed road, alluded to by our correspondent, will pass through a section of country well known in Ohio as one of the richest in agricultural wealth—in the west. It is filled with a hardy and industrious population, and its water power is immense. The amount of travel, and the transportation of goods along this line, is now very great, and with railroad facilities it will necessarily be very largely increased, and must yield, we judge, a very handsome profit upon the investment. The location as referred to in the above letter is a most excellent one, and we hope to see the work pressed forward to

early completion. We shall be happy to hear from our friendly correspondent again.

In connection with this communication, we give place to the following article which we find in a late Cincinnati paper—and which furnishes some interesting details, as regards this route.

"A meeting of the Board of Directors of the Hamilton Railroad Company,"—says the paper we quote from—"was held in Cincinnati on Monday last. As this is a work of great importance to our city, we have taken some pains to collect and collate such portions of its history, statistics and prospects as could be procured from authentic sources.

"The charter of this road was granted by the legislature of 1845-6. Sometime in the fall of the last year, books were opened for the taking of stock, and a sufficient amount being subscribed for that purpose, the company organized on the 1st of January and elected the following named gentlemen as a Board of Directors: John C. Wright, Samuel Fossdick, Charles Anderson and Joseph Longworth, of this city, and William Bebb, John Woods, John W. Erwin, L. D. Campbell and A. P. Miller, of Hamilton.

"This Board elected for their President, Lewis D. Campbell, of Hamilton; John C. Wright, Treasurer, and Charles Anderson, Secretary. The Board as will be seen is principally composed of practical and sound business men; the majority of them occupying positions with regard to the public, which guarantee that the work will be carried on with sufficient force and vigor. They certainly gave evidence of their superior judgment in the selection of their officers, who are men of well known industry and energy.

"The route contemplated is along the Millers Creek valley; (the terminus of the road to be located at some point in the northwestern part of the city,) through the towns of Carthage and Springdale, thus avoiding the hills. The surveys are ordered to be commenced on the 1st day of April, and it gives us pleasure to state, that stock enough is already subscribed to justify the letting of contracts for the grading of the entire road. The grading will most probably be put under contract as early as next May, and the work pressed forward to completion with all possible despatch.

"This road will pass through one of the most fertile regions upon the face of the globe—a country unsurpassed for its agricultural products and manufacturing advantages. The work is then certainly destined to become one of the most important arteries which furnish the life blood and healthy action of our city. Any one who is familiar with Boston, and the sterile country surrounding it on every side, through which works of this kind ramify in all directions, all of which are profitable stock, must be satisfied with the great importance of the railroads, which must, at no distant time, diverge at all points from the growing Queen of the West, throughout the fertile region which contributes so largely to her growth and support. The town of Hamilton with its extensive hydraulic power, and manufacturing facilities, is without doubt, destined to occupy as important a position to this city as Lowell does to Boston.

"The travel between these two points already demands additional facilities for its accommodation. There are now three daily lines of stages, one omnibus, and canal packets, running on the route, which convey about 75 passengers, besides travel by private conveyance, which brings the number up to 100 daily, and the number is rapidly increasing.

"As regards the freight transportation, we have it from good authority, that during the past winter, it was no uncommon thing for over 200 large covered wagons, transporting the products of the great agricultural region west, and returning with goods from the city, to pass through the towns of Hamilton and Rossville, daily.

"Should the contemplated railroad from this city to St. Louis go on, this work will certainly constitute a portion of that road. The route through Hamilton, Rossville, Eaton, Richmond, Indianapolis, and so on westward, being decidedly the most eligible. We trust that our citizens will furnish all the 'aid and comfort' within their power, to push forward this work to a speedy completion."

## Massachusetts Annual Railroad Reports.

Return of the Boston and Providence Railroad, under the Act of April 16, 1846.

## CHARACTERISTICS OF ROAD.

Length of road .....	41 miles.
Length of single track .....	28½ miles.
Length of double track .....	12½ miles.
Length of branches owned by the company, stating whether they have a single or double track .....	6-6 miles, single track. 2 1-5 miles completed.
Weight of rail per yard in main road .....	56 pounds.
Weight of rail per yard in branch roads .....	37½ pounds.
Maximum grade, with its length in main road .....	
Maximum grade, with its length in branch roads ..	
Total rise and fall in main road .....	548 feet.
Total rise and fall in branch roads .....	
Shortest radius of curvature, with length of curve in main road .....	
Shortest radius of curvature, with length of curve in branch roads ..	
Total degrees of curvature in main road .....	
Total degrees of curvature in branch roads .....	
Total length of straight line in main road .....	
Total length of straight lines in branches .....	
Aggregate length of truss track bridges .....	1242 1-12 feet.
Aggregate length of truss road bridges .....	203 4-12 feet.
Whole length of road unfinished on both sides .....	

## DOINGS DURING THE YEAR.

Miles run by passenger trains .....	140,874
Miles run by freight trains .....	51,786
Miles run by other trains .....	6,268
Total miles run .....	198,928

N.B. The Treasurer's books do not show the cost of road and equipment in the detail required by the Act of April 16, 1846.

Number of passengers carried in the cars .....	476,515
Number of passengers carried one mile .....	7,453,177
Number of tons of merchandize carried in the cars ..	82,192
Number of tons of merchandize carried one mile ..	1,962,769
Number of passengers carried one mile, to and from other roads .....	1,257,984
Number of tons carried one mile, to and from other roads .....	595,128
Average rate of speed adopted for passenger trains, including stops .....	25 miles per hour.
Average rate of speed adopted for freight trains, including stops .....	12 miles per hour.
Estimated weight in tons of passenger trains, including engine and tender, but not including passengers, hauled one mile .....	4,842,223
Estimated weight of merchandize trains, including engine and tender, but not including freight, hauled one mile .....	3,916,924

## EXPENDITURES FOR WORKING THE ROAD.

For repairs of road, maintenance of way, exclusive of wooden truss bridges and renewals of iron ..	\$16,318 54
For repairs of truss bridges .....	4,581 48
For renewals of iron, including laying down .....	2,951 26
For wages of switch-men, gate-keepers and flag-men ..	629 23
For removing ice and snow .....	
For repairs of fences, gates, houses for flag-men, gate-keepers, switch-men, tool-houses .....	959 23
Total for maintenance of way .....	\$25,439 74

## MOTIVE POWERS.

For repairs of locomotives .....	12,173 34
For new locomotives to cover depreciation .....	13,000 00
For repairs of passenger cars .....	3,814 46
For new passenger cars to cover depreciation .....	
For repairs of merchandize cars .....	5,314 61
For new merchandize cars to cover depreciation ..	
For repairs of gravel and other cars .....	
Total for maintenance of motive power .....	34,302 41

## MISCELLANEOUS.

For fuel and oil .....	42,350 04
For salaries, wages and incidental expenses, chargeable to passenger department .....	22,923 58
For salaries, wages and incidental expenses, chargeable to freight department .....	13,641 43
For gratuities and damages .....	2,261 56
For taxes and insurance .....	1,508 21
For ferries .....	6,072 27
For repairs of station building, aqueducts, fixtures, furniture .....	3,633 81
For interest .....	
For amount paid other companies in tolls for passengers and freight carried on their roads, specifying each company .....	
For amount paid other companies as rent for use of their roads, specifying each company : [Boston and Providence Railroad and Transportation Co., for use of their road in Rhode Island] ..	7,958 78
For salaries of president, treasurer, superintendent, law expenses, office expenses of the above offices, and all other expenses not included in any of the foregoing items .....	10,287 65
	109,937 33
	\$169,679 48

## INCOME DURING THE YEAR.

## For Passengers:

Main road .....	\$156,196 65
Dedham branch .....	24,288 94
Taunton branch .....	40,897 10
Stoughton branch .....	9,103 58
	\$220,486 27

## For Freight:

Main road .....	87,852 49
Dedham branch .....	1,225 49
Taunton branch .....	16,814 60
Stoughton branch .....	4,989 65
	110,882 23

From rents .....	679 11
Interest and premium on sales of stock .....	9,648 12
Dividends on stock of Stoughton branch railroad ..	3,000 00
Mails .....	6,179 10
	360,875 03

Total income .....	360,875 03
Net earnings after deducting expenses .....	191,195 55

## DIVIDENDS.

Two of 4 per cent. each .....	172,700 00
Surplus not divided .....	18,495 55
Surplus undivided January 1, 1846 .....	83,743 97
Total surplus .....	\$102,238 52

## ESTIMATED DEPRECIATION BEYOND RENEWALS, VIZ:

No estimate has heretofore been made of the depreciation of the road, bridges and buildings. The road has been opened for use for nearly 12 years, and all the fixtures upon it have been kept in good repair. It is supposed that the whole depreciation may be justly estimated at about \$20,000.

In 1844, the amount of \$40,000, and in 1845, the amount of \$36,004 84, was charged to income account for depreciation of cars and engines. The stock of cars and engines has not depreciated during the last year, the additions having much exceeded in value the deterioration of the old stock.

## ACCIDENTS.

The directors report the following accidents as having occurred during the year:

March 18, Jas. Hagar, a fireman, in the employ of the corporation, fell from the engine while the train was in motion, and was killed.

April 10th, — Clifford sustained a fracture of a leg, in attempting to cross the track in front of an approaching engine.

April 16th, Abraham Hodgson stepped upon the track when the train was within a few feet of him, and was killed.

July 3d, P. Cunningham, a passenger, was killed between two cars, in attempting to pass from one car to another, while the train was in motion.

Oct. 15th, — Snyder was killed in attempting to cross the track, in front of an approaching train.

Nov. 17th, G. E. Fellenious was killed while walking on the track.

C. H. Warren, Wm. Sturges, Wm. Appleton, James K. Mills, John Bryant, Jr.—Directors.

Boston, January 20th, 1847.

## Portable Cottages.

"There is said to have been established at Cincinnati a manufactory of *Portable Cottages*, so constructed that while they constitute very comfortable dwelling houses, they can be readily transported from one location to another with little trouble or expense. We have often wondered that something of the kind had not been introduced."

We copy the above from the "New York Farmer and Mechanic"—and will add that a friend of ours, who resided in Cincinnati last season, informs us that he visited the "manufactory" spoken of—and was invited by the owner to take passage with him on the occasion of one of these "portable cottages" leaving the establishment, to be erected. The party went on board a small boat, the cottage was shipped, and half a dozen men went down the Ohio river, a distance of some 20 miles—where the house was to be "put up." They moved the materials (which of course had all been prepared, like the different portions of a wardrobe or bedstead) to the spot chosen for its erection, and the next evening the party all took tea with the family, and returned home again! The house (four rooms, with three closets) was grooved, morticed, and put up in "good shape"—and occupied, within forty-eight hours after it left Cincinnati.

## Magnetic Telegraph.

The Cincinnati Gazette states that an agreement has been entered into with Mr. Henry O'Reilly and the Trustees of Morse's patent right, in the West—whereby all difficulties between the parties may be adjusted. The signatures of the patentees at Washington, is all that is required to complete the arrangement. By the terms of the agreement, Mr. O'Reilly will construct the line from Pittsburg to Columbus, and Mr. Case the line from Columbus to Louisville. The work is to be done so as to have the line in operation to Cincinnati and Louisville by the first of July. The arrangement is looked upon as highly advantageous to the subscribers to the stock, on the lines between Pittsburg and Louisville, and between Louisville and New Orleans.

The obstacles in the way of the construction of this important chain of communication being re-

moved, "we have now a prospect," says a late Columbus paper, "that on the 4th of July next, the dealer in produce in Columbus may step into the Telegraph office, and for the cost of two or three dimes, and in less than that number of minutes, ascertain the prices of his commodities in Philadelphia, New York and Cincinnati. What transpires in New York and Boston in the morning, will be published in the Columbus papers by noon. This is truly a wonderful age in which we live! Mr. Bravo, of 'The Commercial Rooms,' in New Orleans, is appointed agent in that city for the Western Telegraph Company. The sum only of \$75,000 is required to carry the line from New Orleans through the Western States to Cincinnati, and thence to Pittsburg, and so on to Philadelphia."

## ITEMS.

*Inspection of the Paris and St. Germain Atmospheric Railway.*—On Sunday morning at about nine o'clock, a special train of the Paris and St. Germain railway, left Paris with the Minister of Public Works, and the committee charged to examine, and, if satisfied, authorize the opening to the public of the portion of the line which connects, by means of the atmospheric principle, the station of Pecq, with the town of St. Germain. The committee consisted of MM. Arago (president,) Cordier, Vauvilliers, Pouillet, Piobert, Mallet, Combes, Bineau, etc. A great number of persons who had received invitations, went by this train. The Minister of Public Works, on arriving at the atmospheric portion of the line, visited every part of the works, and, in conjunction with the committee ordered several experiments to be performed, in order that they might be convinced of the power and security of all the means employed. After this visit of inspection, which appeared to give general satisfaction, the ministers and the members of the commission returned to Paris.

*Extraordinary Wire Rope.*—(From a Correspondent.—As your valuable Journal is one of the greatest mediums of the industrial arts, I beg to communicate an extraordinary production of the art of rope making. Thursday, on passing the celebrated Galvanized Iron and Wire Rope Works of Mr. Andrew Smith, Millwall, Poplar, I witnessed the shipment of a wire rope, which the manager of the works informed me was no less than 3600 yards long, 3 inches circumference, and weighed 7 tons 15 cwt., and ordered for an incline plane in Lancashire, between Blackburn and Bolton. This is, no doubt, the largest wire rope ever yet been made; and I was informed, that it was only commenced last Monday, and that the wire was in bars of iron not more than ten days before. What will Russia say to this, Mr. Editor?—*Atmospheric Railway Gazette.*

*Iron Bridge Rails.*—We understand that Mr. Wood, of the British Iron Company's Works, Abersychan, succeeded in rolling, during last week, bridge rails weighing 90 lbs. per yard, 30 feet long; and finer and more perfect rails, a correspondent asserts, were never seen. This is but one of the many instances in which Mr. Wood has proved his great skill and extensive practical knowledge of the manufacture of rails and

other iron, as well as the *minutiae* of the iron manufacture generally—as the workings for which this establishment is celebrated fully testify.—*Atmospheric Railway Gaz.*

*The New York Canal Board* has determined to reduce the rate of toll on corn meal, which has heretofore paid the same rate as wheat flour, viz: four mills on 1000 lbs. per mile. Hereafter the toll on corn meal is to be three mills per 1000 lbs. per mile, being the same rate at now charged on corn.

*Ocean Steam Navigation.*—The city of Bremen has subscribed \$100,000, the government of Prussia, \$100,000, the free city of Frankfort, \$20,000, and other cities sums corresponding to their abilities, towards the establishment of the steamship line between New York and Bremen.

*Tonnage on the Upper Lakes.*—The tonnage on the upper lakes for the business of 1847, is estimated by the Buffalo Commercial Advertiser, at 87,743 tons, added to which are several vessels now in course of construction, which will be completed during the season, and will swell the aggregate to 100,000 tons. This tonnage furnishes employment to over 6000 persons. A safe and profitable business has been pursued during the season of 1842.

*The Sound Steamers.*—The New York Herald says the Oregon is to be put upon the Stonington route next week, with Captain Thayer as her commander. Improvements have been made upon her the past winter, at an expense of \$14,000. An improvement has been made in the construction of her steam chest and pipe, so as to prevent the possibility of its breaking, as in the case of the Atlantic. She will now carry two 1½ inch chain cables, each ninety fathoms in length, and an additional anchor of 2000 pounds.

*Penobscot and Kennebec Railroad.*—A mass meeting of the citizens of the Penobscot, Somerset and Piscataqua was held at Dexter, Me., in reference to a railroad from the Kennebec to Bangor. Resolutions were adopted declaring that in the opinion of the meeting, the time had come when a railroad from the Kennebec river to Bangor can be accomplished, and that the citizens between those rivers "can and will subscribe to the stock of the Penobscot and Kennebec railroad, the sum of \$200,000.

*Wealth of Philadelphia.*—Philadelphia can boast of a vast amount of wealth in the real and personal property of the city and county alone, without counting the immense amount invested in trade and commerce, and the heavy stocks of goods in the stores and warehouses of the city. The following is an exhibit of the assessed value of the real and personal property of the city and county as returned to the State Government.

Real estate.....	\$105,939,405
Horses and cows.....	417,467
Personal property.....	1,574,681
Furniture (above \$300).....	2,608,115
Carriages.....	163,463
Emoluments of office.....	173,117
Money at interest.....	21,019,336
Watches, about.....	100,000

25,000 to 30,000 made weekly. 35

**T**HE NEWCASTLE MANUFACTURING Company continue to furnish at the Works, situated in the town of Newcastle, Del., Locomotive and other steam engines, Jack screws, Wrought iron work and Brass and Iron castings, of all kinds connected with Steamboats, Railroads, etc.; Mill Gear-ing of every description; Cast wheels (chilled) of any pattern and size, with Axles fitted, also with wrought tires, Springs, Boxes and bolts for Cars; Driving and other wheels for Locomotives.

The works being on an extensive scale, all orders will be executed with promptness and despatch. Communications addressed to Mr. William H. Dobbs, Superintendent, will meet with immediate attention. **ANDREW C. GRAY,** 245 President of the Newcastle Manuf. Co.

**R**AILROAD IRON AND LOCOMOTIVE Tyres imported to order and constantly on hand by **A. & G. RALSTON** 4 South Front St., Philadelphia. 294

**VALUABLE PROPERTY ON THE MILL Dam For Sale.** A lot of land on Gravelly Point, so called, on the Mill Dam, in Roxbury, fronting on and east of Parker street, containing 68,497 square feet, with the following buildings thereon standing.

Main brick building, 120 feet long, by 46 ft wide, two stories high. A machine shop, 47x43 feet, with large engine, face, screw, and other lathes, suitable to do any kind of work.

Pattern shop, 35x32 ft. with lathes, work benches, Work shop, 86x35 feet, on the same floor with the pattern shop.

Forge shop, 118 feet long by 44 feet wide on the ground floor, with two large water wheels, each 16 feet long, 9 ft diameter, with all the gearing, shafts, drums, pulleys, &c., large and small trip hammers, turnaces, forges, rolling mill, with large balance wheel and a large blowing apparatus for the foundry.

Foundry, at end of main brick building, 60x45½ feet two stories high, with a shed part 45½x20 feet, containing a large air furnace, cupola, crane and corn oven.

Store house—a range of buildings for storage, etc., 200 feet long by 20 wide.

Locomotive shop, adjoining main building, fronting on Parker street, 54x25 feet.

Also—A lot of land on the canal, west side of Parker st., containing 6000 feet, with the following buildings thereon standing:

Boiler house 50 feet long by 30 feet wide, two stories.

Blacksmith shop, 49 feet long by 20 feet wide.

For terms, apply to **HENRY ANDREWS, 48 State st.,** or to **CURTIS, LEAVENS & CO., 106 State st., Boston,** or to **A. & G. RALSTON & Co., Philadelphia.** ja45

**TO RAILROAD COMPANIES AND BUILDERS OF MARINE AND LOCOMOTIVE ENGINES AND BOILERS.**

**PASCAL IRON WORKS.****WELDED WROUGHT IRON TUBES**

From 4 inches to 4 in calibre and 2 to 15 feet long, capable of sustaining pressure from 400 to 2500 lbs. per square inch, with Stop Cocks, T's, L's, and other fixtures to suit, fitting together, with screw joints, suitable for STEAM, WATER, GAS, and the LOCOMOTIVE and other STEAM BOILER FLUES.

Manufactured and for sale by

**MORRIS, TASKER & MORRIS.**  
Warehouse S. E. corner of Third & Walnut Streets,  
**PHILADELPHIA.**
